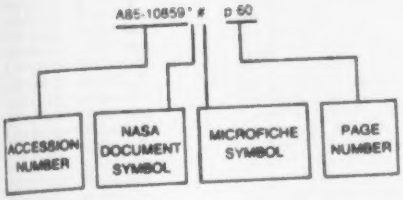
# ACCESSION NUMBER INDEX

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# SPECIAL NOTICE

The abstract sections of the monthly supplements of *Aeronautical Engineering* can be bound separately. Individual abstracts can be located readily by means of the page numbers given at each entry, e.g., p 602 N85-25774. To assist the user in binding Supplements SP-7037(184) through SP-7037(195), a title page is included in this Cumulative Index.

16. Abstract

This bibliography is a cumulative index to the abstracts contained in NASA SP-7037 (184) through NASA SP-7037 (195) of Aeronautical Engineering. A Continuing Bibliography. NASA SP-7037 and its supplements have been compiled through the cooperative efforts of the American Institute of Aeronautics and Astronautics (AIAA) and the National Aeronautics and Space Administration (NASA). This cumulative index includes subject, personal author, corporate source, foreign technology, contract, report number, and accession number indexes.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

## ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges.

| | |
|---|---|
| STAR (N-10000 Series) | N86-10001 – N86-12198 |
| IAA (A-10000 Series) | A86-10001 – A86-12608 |

This bibliography was prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by RMS Associates.

NASA SP-7037(197)

# AERONAUTICAL ENGINEERING

## A CONTINUING BIBLIOGRAPHY WITH INDEXES

## (Supplement 197)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in January 1986 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

NASA Scientific and Technical Information Branch 1986
**National Aeronautics and Space Administration**
Washington, DC

This supplement is available as NTISUB/141/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $8.00 domestic; $16.00 foreign.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 488 reports, journal articles, and other documents originally announced in January 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 1

**Category 02 Aerodynamics** 4
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 20
Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 20
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 21
Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 33
Includes cockpit and cabin display devices; and flight instruments.

**Category 07 Aircraft Propulsion and Power** 35
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 45
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 48
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 50
Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 51
Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 54

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 65

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** N.A.

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 67

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 70

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 72

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** N.A.

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

**Category 19 General** N.A.

FEBRUARY 1986

## 01

## AERONAUTICS (GENERAL)

**A86-10148#**
**AGONIES OF THE LEAR FAN**
R. DEMEIS Aerospace America (ISSN 0740-722X), vol. 24, Oct. 1985, p. 52-54, 56, 58, 60.

The design and attempted certification of the Lear Fan 2100 are discussed. The twin-turbine, single pusher prop aircraft, which was built with composites, is described. The costs incurred due to an effort to speed completion of a prototype resulted in new investors and work was centered on certification of the aircraft. Static and pressure testing were conducted; the problems encountered and the required redesigning are explained. The technique and composite used to build the structure are described. The FAA testing of the gearbox and the failures observed are discussed. The effects of testing full-size production structures are examined. I.F.

**A86-10351**
**REMOTELY PILOTED VEHICLES; INTERNATIONAL CONFERENCE, 4TH, BRISTOL, ENGLAND, APRIL 9-11, 1984, PROCEEDINGS AND SUPPLEMENTARY PAPERS**
Conference sponsored by the Royal Aeronautical Society and University of Bristol. Bristol, University of Bristol, 1984. Proceedings, 211 p.; Supplementary Papers, 48 p. For individual items see A86-10352 to A86-10376.

Among the topics discussed are: the operability of RPVs in bad weather; multi-mission RPV system experience; and the operational Eyrie multi-role all-weather advanced RPV system. Consideration is also given to: low cost-propulsion systems for unmanned vehicles; the aerodynamics of RPV airframes; and design standards for unmanned vehicles. Additional topics discussed include: launch and recovery systems for airborne RPVs; magnetic RPV guidance systems; and the development of a vertical gyroscope system for RPV applications. I.H.

**A86-10353**
**UNMANNED AIRCRAFT FOR THE ROYAL AIR FORCE?**
P. G. JENKINS (Logica UK, Ltd., London, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 2.1-2.7. refs

Some possible applications of unmanned aircraft for the Royal Air Force are discussed in connection with the state of the art of RPV design. Attention is given to the tactical advantages of operating an unmanned aircraft in a hostile battlefield environment including lower attrition; mission flexibility and lower man-hour maintenance costs. However, it is shown that shortcomings of current sensing and computing technologies continue to make manned aircraft a cheaper and more efficient alternative to military RPVs. The near term and long term uses of unmanned aircraft are described on the basis of their technological characteristics. Emphasis is given to the reconnaissance and electronic warfare roles of nonexpendable RPVs; and surveillance and target drones. It is shown that an autonomous squadron of ground launched RPVs of equal force effectiveness as a squadron of ALCM-armed aircraft would save over $1.6 billion over a 10 year period. I.H.

**A86-10356**
**MULTI-MISSION RPV SYSTEM EXPERIENCES**
G. R. SEEMANN, G. L. HARRIS, C. K. LAIR, and H. E. KRACHMAN (Developmental Sciences, Inc., City of Industry, CA) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 8.1-8.9.

The operational capabilities and design characteristics of a multi-role RPV system, the R4E-40 RPV, are described. The system is designed to carry a variety of telescopic and other sensors for real-time or way-point surveillance in hostile airspace. The control system of the R4E-40 consists of a three-axis autopilot coupled with quick-response servos for maximum stability in rough air. The R4E-40 can be launched by a mobile hydraulic launcher and is recoverable either by a landing ski or a cruciform parachute. Some of the payloads carried by the R4E-40 include: forward looking infrared sensors for target acquisition in low light; a panoramic film camera; and an infrared line scanner with a 120-degree cross track scan. Black and white photographs of the RPV system are provided. I.H.

**A86-10357**
**OPERATIONAL PHILOSOPHY OF INTERNATIONAL FULL-SCALE AERIAL TARGETS**
J. R. JACKSON (Sperry Flight Systems, Albuquerque, NM) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 9.1-9.9.

A program to convert obsolete aircraft for autonomous operation as target drones is described. The advantages of full scale aerial targets (FSATs) in comparison with subscale targets are considered, including: realistic threat simulation; greater payloads; and lower acquisition costs. Some safety features built into the QF-4 FSAT or the USAF are described including redundant command and control; a self-destruct system; and automatic loss-control computer routines. The sequence of events in a typical FSAT mission is shown in a diagram. I.H.

**A86-10359**
**NOW IS THE TIME FOR REMOTELY PILOTED HELICOPTERS**
R. G. AUSTIN and W. J. ALLDRIDGE (ML Aviation Co., Ltd., Bristol, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 11.1-11.14.

The development of small lightweight remotely piloted helicopters (RPHs) for battlefield surveillance applications is discussed. Some of the tactical advantages of small-scale RPV systems in today's dense military electronics environment are considered with emphasis given to the small radar and infrared signatures of RPHs; and their lower acquisition costs, i.e., expendability. The design characteristics of a prototype RPH system, the SPRITE, are described. The SPRITE is a dual rotor RPH which has a payload capacity of 6 kg and an endurance of about 2.5 hours per tank of fuel. The powerplant consists of two 6-bhp two-cycle engines. Electronic subsystems on the SPRITE include an on board alternator; a servomotor drive amplifier; and a command link airborne receiver. A photograph of the SPRITE RPH is provided. I.H.

**A86-10373**

### AREA SEARCH RATE AND IMAGE INTERPRETER PERFORMANCE

R. S. HARVEY (Army Personnel Research Establishment, Farnborough, England) and E. M. CARVER (British Aerospace, PLC, Bristol, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Supplementary Papers . Bristol, University of Bristol, 1984, p. 3.1-3.10.

A study by the Army Personnel Research Establishment (APRA) and the British Aerospace Human Factors Group (BAe) to determine the limits to image interpreter target aquisition performance for diverse area search rate conditions imposed by various factors is presented. The APRE method of simulated optical imagery and the BAe method of simulated infrared linescan imagery utilized to study area search rate are explained and compared. Both photographic interpreters and civilians participated in the test and tabular and graphic presentations of the results are provided. A comparison of the two methods based on imagery effects, terrain effects, air vehicle velocity, area search rate, method of presentation, and fields of view is presented. The results revealed that higher search rates are achieved with an IR linescan than with an optical sensor. I.F.

**A86-10375**

### TECHNOLOGY FOR MINI-RPV'S

H. WALD and V. SCHLENKRICH (Messerschmitt-Boelkow-Blohm GmbH, Bremen, West Germany) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Supplementary Papers . Bristol, University of Bristol, 1984, p. 17.1-17.13.

The design of a mini-RPV system for real-time reconnaissance and surveillance and fire control for artillery and post strike reconnaissance is discussed. The operational requirements for the mini-RPV, the composition of the platoon, and the operational sequence are explained. The design requirements and advantages of the stabilization and point unit of the mini-RPV, which is based on roll/pitch axes gimbal stabilization, are described. A block diagram of the jam resistant data link, and an explanation of the main features of the system are presented. The use of stealth technology to camouflage the radar, infrared, acoustic, and visual signals of the mini-PRV is discussed. Diagrams, charts, and photographs explaining the mini-RPV are provided. I.F.

**A86-10928#**

### LOGISTICS SUPPORTABILITY CONSIDERATIONS DURING CONCEPTUAL AND PRELIMINARY DESIGN

D. P. SCHRAGE and S. A. MEYER (Georgia Institute of Technology, Atlanta) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. (AIAA PAPER 85-3052)

Big payoffs in aircraft life cycle costs and mission effectiveness can be achieved if logistic supportability considerations are adequately addressed during conceptual and preliminary design. Logistic supportability considerations must be sensitized and traded off like other quantifiable design parameters. With current aircraft design practices this has been difficult. This paper discusses methods to address logistic supportability trade-offs. The concept formulation effort for the U.S. Army's Light Helicopter Experimental (LHX) program is used to illustrate these methods. Author

**A86-10930*#** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.

### SOME COMPARISONS OF US AND USSR AIRCRAFT DESIGN DEVELOPMENTS

M. L. SPEARMAN (NASA, Langley Research Center, Hampton, VA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 15 p. refs
(AIAA PAPER 85-3060)

A review is given of the design and development of some U.S. and U.S.S.R. aircraft. The emphasis is on the historical development of large aircraft - civil and military transports and bombers. Design trends are somewhat similar for the two countries and indications are that some fundamental characteristics are dictated more by ideological differences rather than technological differences. A brief description is given in a more or less chronological order of the major bomber aircraft, major civil and military transport aircraft, and the development of the air transport systems. Author

**A86-10950#**

### LHX PROGRAM OVERVIEW

R. K. ANDRESON (U.S. Army, Materiel Command, St. Louis, MO) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 5 p.
(AIAA PAPER 85-4006)

The LHX helicopter concept is being developed by the U.S. Army to serve as a replacement for existing UH-1, AH-1, OH-58 and OH-6 helicopters. The LHX will incorporate state of the art technology, provide higher readiness, lower support costs and improved safety, and will function in a variety of high threat environments. Two variants are planned: scout/attack (SCAT) and light utility, both being conventional rotorcraft. Advanced avionics, sensor fusion and flight control systems will obviate the need for a copilot on the SCAT. Laser and FLIR guidance and target acquisition systems will be augmented by helmet-mounted displays, with the helmet offering chemical, biological and laser protection. The T800-XX-800 turboshaft engine contracts have been awarded, and RFPs for development of the LHX prototypes will be issued in 1986. M.S.K.

**A86-10952#**

### POST-2000 - THE MULTIMODE AIRCRAFT SYSTEM

S. A. TREMAINE (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 6 p.
(AIAA PAPER 85-4015)

The multimode aircraft system concept and its potential use are examined. Some of the requirements necessary for future weapons systems are described. These weapon systems will be specialized, complex, and expensive; therefore, the design of an inexpensive aeronautical system which can perform more than one specific, specialized mission is needed. Examples of aircraft which have been designed for growth and operational improvements are provided. The difficulty in designing a multimode system and the positive and negative aspects of the development of this system are discussed. Examples of aircraft designed for modularization are presented. I.F.

**A86-11602*#** National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.

### FUTURE DIRECTIONS IN AEROPROPULSION TECHNOLOGY

N. T. SAUNDERS and A. J. GLASSMAN (NASA, Lewis Research Center, Cleveland, OH) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 3-22. Previously announced in STAR as N85-23685.

Future directions in aeropropulsion technology that have been identified in a series of studies recently sponsored by the U.S. Government are discussed. Advanced vehicle concepts that could become possible by the turn of the century are presented along with some of their projected capabilities. Key building-block propulsion technologies that will contribute to making these vehicle concepts a reality are discussed along with projections of their status by the year 2000. Some pertinent highlights of the NASA aeropropulsion program are included in the discussion. Author

**A86-11647#**

**THE HISTORY AND FORESEEABLE DEVELOPMENTS IN RECIPROCATING ENGINES FOR AIRCRAFT**

C. M. EHRESMAN (Purdue University, West Lafayette, IN) and R. L. SPENCER (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 408-412. refs

A review of engine development for aircraft is presented. The major advances incorporated into engine designs from 1903 to the present are described. A chart explaining engine performanace based on horse power, specific power, specific output, and specific fuel consumption is provided. The areas where further research is required, particularly in reducing fuel consumption and using alternative fuels, are examined and proposed designs are discussed. I.F.

**A86-11872**

**REPAIR OF AIR-COOLED TURBINE VANES OF HIGH-PERFORMANCE AIRCRAFT ENGINES - PROBLEMS AND EXPERIENCE**

P. BRAUNY, M. HAMMERSCHMIDT, and M. MALIK (Deutsche Lufthansa AG, Hamburg, West Germany) Materials Science and Technology (ISSN 0267-0836), vol. 1, Sept. 1985, p. 719-727. refs

Air-cooled turbine vanes made from nickel- and cobalt-base superalloys undergo distortion, cracking, burning, and material degradation in operation. The complex geometry of the parts and the compositional and microstructural heterogeneity of cast alloys impose limitations on the selection of repair methods. Selective chemical stripping of the diffusion coatings; elimination of cracks and restoration of dimensions by joining processes involving both welding and brazing techniques; and formation of coatings by pack cementation are the major processes employed. These processes may give rise to defects that significantly diminish the integrity of the parts. Author

**A86-12290**

**HUMAN-POWERED FLIGHT**

M. DRELA (Institute for Defense Analyses, Alexandria, VA) and J. S. LANGFORD Scientific American (ISSN 0036-8733), vol. 253, Nov. 1985, p. 144-151.

For many centuries, people have dreamed of human flight. These dreams were concerned with flight in which the flier would provide the power, as a bird does. Yet only in the past 25 years has a human-powered aircraft been developed. In 1977, a prize related to the achievement of human-powered flight was finally won by flying the Gossamer Condor around a one-mile, figure-eight course exclusively under human power. In June 1979, a similar aircraft was pedaled across the English Channel. Details concerning three generations of human-powered aircraft are discussed along with the special characteristics which distinguish aircraft for human-powered flight from other aircraft. Attention is also given to a utilization of the technology, developed for human-powered aircraft, in other application areas. G.R.

**N86-10001#** Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

**ACTA AERONAUTICA ET ASTRONAUTICA SINICA (SELECTED ARTICLES)**

4 Oct. 1984 64 p refs Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 4, 1983 p 1-19, 11-19; 39-47; 101-104
(AD-A147304; FTD-ID(RS)T-1120-84) Avail: NTIS HC A04/MF A01 CSCL 01B

Research in aeronautics and astronautics in China is discussed. Some areas of research are: (1) approximation method for transonic flow over swept wings; (2) shock turbulent interaction over a compression corner for supersonic flow; (3) optimum design of an aircraft wing; and (4) a simple estimation method for two phase flow in a nozzle of rocket ramjet engine.

**N86-10006#** Information Spectrum, Inc., Arlington, Va.

**F-16X MSIP (MULTI-NATIONAL STAGED IMPROVEMENT PROGRAM) CASE EXAMPLE: OPERATING AND SUPPORT COST ESTIMATION USING VAMOSC (VISIBILITY AND MANAGEMENT OF OPERATING AND SUPPORT COSTS) Final Technical Report**

W. C. REDEEN 17 Aug. 1984 71 p
(Contract F33600-82-C-0543)
(AD-A156893; ISI-V-4859-02) Avail: NTIS HC A04/MF A01 CSCL 05A

This case example of a hypothetical F-16X MSIP (Multi-National Staged Improvement Program) Operating and Support (O&S) cost estimate, sponsored by AFLC/MM (VAMOSC), has been prepared to demonstrate and test the capability of the Air Force Visibility and Management of Operating and Support Costs (VAMOSC) system to provide unique and detailed experience data suitable for credible and explicit O&S cost estimation for advanced Air Force aircraft systems and subsystems. The specific objective of this effort is: To produce a case example of VAMOSC applicability to O&S cost estimation which conforms to the following conditions: Is compatible with OSD/CAIG and USAF costing guidance. Is linkable to reported experience data for existing aircraft. Provided a VAMOSC-Supported Methodology which can be utilized to predict the impact of configuration changes on system O&S costs. Depicts a methodology which is applicable to O&S costing for any aircraft system in advanced conceptual development. Provides estimates which are verifiable by tests. Identifies areas of VAMOSC requiring enhancement or modification to improve system integrity and applicability. GRA

**THREE ARTICLES ON NEW CALCULATION METHODS IN AERONAUTICS (SELECTED ARTICLES)**

17 Aug. 1984 55 p refs Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 3, Sep. 1983 p 1-18, 56-62, and 102-104
(AD-A145745; FTD-ID(RS)T-0910-84) Avail: NTIS HC A04/MF A01 CSCL 01B

Selected research topics are investigated in search of new calculation methods for aeronautics. Numerical solutions are sought for calculating hypersonic flow and unsteady supersonic aerodynamic forces. Methods for determining aerodynamic coefficients are discussed. Selected highlights of the third conference of the Aeronautical Society of China are also discussed. Shear layer effects on the stability of an axisymmetrical external compression air intake are investigated.

**AERODYNAMICS AND ACOUSTICS OF PROPELLERS**

Loughton, England Feb. 1985 456 p refs In ENGLISH and FRENCH Symp. held in Toronto, 1-4 Oct. 1984
(AGARD-CP-366; ISBN-92-835-0374-0) Avail: NTIS HC A20/MF A01

A state of the art review of the aerodynamic design and testing of modern propellers, acoustic and vibration environmental problems and their solutions, and considerations in the integration of the propeller(s) and airframe is presented. Propellers have recently become a focus of attention after having been neglected for many years. The efficient use of propellers as a propulsion medium up to Mach 0.6 was realized at the expense of high noise and vibration. Since the mid-1970s there have been many developments, including the propfan, with an aerodynamic efficiency of 80% at Mach 0.8 now seriously challenges the fanjet. The advent of the supercritical airfoil is another significant development beginning to influence propeller design.

(Contract DAJA37-81-C-1213; DAAG29-79-C-0184)

This paper describes improvements in a modeling methodology for congruent plumes produced from nonideal nozzle flows and a series of verification tests including complex afterbody and wake flows caused by angle of attack and afterbody-mounted control fins at incidence. The results show that the modeling methodology gives good agreement for the base pressure and separation location for stagnation pressure ratios of + or 25 percent from the design condition, for angles of attack as high as + or - 20 deg, and with the effects of control fins deflected + or - 10 deg in conjunction with angle of attack of + or - 6 deg. A small but systematic difference between the prototype and model results is evident, and a possible explanation is offered. Author

**COMPARISON OF UNIFORM PERTURBATION AND NUMERICAL SOLUTIONS FOR SOME POTENTIAL FLOWS PAST SLENDER BODIES**
T.-C. WONG (George Washington University, Washington, DC), C. H. LIU (NASA, Langley Research Center, Hampton, VA), and J. GEER (New York, State University, Binghamton) Computers and Fluids (ISSN 0045-7930), vol. 13, no. 3, 1985, p. 271-283. Previously announced in STAR as N85-14799. refs
(Contract NAS1-14605; NAS1-17070)

Approximate solutions for potential flow past an axisymmetric slender body and past a thin airfoil are calculated using a uniform perturbation method and then compared with either the exact analytical solution or the solution obtained using a purely numerical method. The perturbation method is based upon a representation of the disturbance flow as the superposition of singularities distributed entirely within the body, while the numerical (panel) method is based upon a distribution of singularities on the surface of the body. It is found that the perturbation method provides very good results for small values of the slenderness ratio and for small angles of attack. Moreover, for comparable accuracy, the perturbation method is simpler to implement, requires less computer memory, and generally uses less computation time than the panel method. In particular, the uniform perturbation method yields good resolution near the regions of the leading and trailing edges where other methods fail or require special attention. Author

**SOLUTION OF VISCOUS TRANSONIC FLOW OVER WINGS**
R. R. CHOW (Grumman Aerospace Corp., Bethpage, NY) Computers and Fluids (ISSN 0045-7930), vol. 13, no. 3, 1985, p. 285-317. refs
(Contract NAS1-16858)

Since the calculations of plane steady transonic flows conducted by Murman and Cole (1971), steady progress has been made with respect to the computation of inviscid transonic flows. It has been found that it is inadequate to consider practical wing design at transonic speeds without considering the effects of viscosity and turbulence. The present study has the objective to develop a zonal method for viscous transonic flow over three-dimensional (3-D) wings. The employed approach follows closely the viscous/inviscid interaction techniques discussed by Melnik et al. (1983) for viscous flow about airfoils. Attention is given to inviscid flow equations and boundary conditions, the solution of 3-D boundary layer and wake, an iterative solution to viscid-inviscid interaction analysis, and results obtained for a transonic cruise wing of transport type. **SHOCK FITTING IN CONICAL SUPERSONIC FULL POTENTIAL FLOWS**
M. J. SICLARI (Grumman Aerospace Corp., Bethpage, NY) and M. VISICH Computers and Fluids (ISSN 0045-7930), vol. 13, no. 3, 1985, p. 319-335. refs

The full potential equation is solved implicitly for supersonic conical flows with the bow shock fitted as an external boundary. Existing potential flow computational procedures capture the embedded crossflow shock within the context of transonic relaxation schemes. In this study, the crossflow shock is fitted for the first time in potential flow as an internal boundary. Hence, all shocks are implicitly fit making the computation fully conservative. For thin elliptic cones, the outer segment of the crossflow shock was found to be oblique to the incoming or supersonic crossflow. This behavior was not found for circular cones. The shock fitted solutions are compared to both Euler and potential captured solutions. The full potential shock fitted results are in favorable agreement with conservative captured solutions. Author

**ENTROPY CORRECTIONS TO SUPERSONIC CONICAL NONLINEAR POTENTIAL FLOWS**
M. J. SICLARI and A. RUBEL (Grumman Aerospace Corp., Bethpage, NY) Computers and Fluids (ISSN 0045-7930), vol. 13, no. 3, 1985, p. 337-359. refs

Entropy corrections are applied to full potential supersonic conical flows that have the bow shock fit as a boundary. The entropy corrections require the implementation of the Rankine-Hugoniot shock relations instead of the isentropic shock conditions. In addition, the pressure must be corrected to account for the bow shock induced entropy variation. For high Mach number and/or large deflection angles, the correction to the potential pressures can be of the same order of magnitude as the Euler pressures. Considering the simplistic nature of the corrections, remarkably accurate results are achieved for circular and elliptic cones. Additional corrections account for embedded crossflow shocks. Author

**AN EXPERIMENTAL INVESTIGATION INTO THE EFFECTS OF MODIFYING THE TRAILING EDGE GEOMETRY OF A WORTMANN FX63-137 AEROFOIL**
P. M. RENDER (Cranfield Institute of Technology, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 15.1-15.13. Research supported by the Ministry of Defence (Procurement Executive).

Wind tunnel tests were carried out to study the effects of modified trailing edge geometry on the aerodynamics of a number of FX63-137 airfoil configurations corresponding to Reynolds numbers in the range 300,000-1,000,000. One particular airfoil, the Goettingen 797, showed reduced laminar separation due to its flat lower surface configuration. A total of four alternative trailing edges having reduced undercamber and increased trailing edge thickness were tested in addition to the Goettingen airfoil. It is shown that modification of the thin trailing edge and undercamber of FX63-137 incurred only slight penalties in aerodynamic performance and actually led to improvements in the lift/drag ratio. Pressure measurements for the FX63-137 and the modified airfoil sections are provided. I.H.

**EFFECT OF HINGE GAP ON AERODYNAMICS OF THIN AIRFOILS HAVING AN OSCILLATING FLAP**

S. ANDO (Nagoya University, Japan) and D.-H. LEE (Ulsan Institute of Technology, Republic of Korea) ASME, Transactions, Journal of Applied Mechanics (ISSN 0021-8936), vol. 52, Sept. 1985, p. 712-717. refs

Nonsteady load distributions on a thin airfoil in inviscid incompressible flow having an oscillating flap with a narrow hinge gap are investigated. The angle of attack is assumed to be zero in front of the hinge gap. The problem is first attacked numerically through Poisson's integral equation to compare it with analytical methods derived later. The logarithmic singularity in the kernal function is treated with special care. Secondly the method of matched asymptotic expansions is used to analyze the problem. It brings forth simple closed-form expressions. Comparisons of results of the two methods show excellent agreement with each other, when gap width-to-chord ratio is less than 0.1. In addition, a simplified method is presented where no inner solution needs to be considered. It is useful for the gap/chord ratio less than 0.01. Author

**BOUNDED FLOW PAST A SUPERCAVITATING FINITE-SPAN WING [OB OBTEKANII SUPERKAVITIRUIUSHCHEGO KRYLA KONECHNOGO RASMAKHA OGRANICHENNYM POTOKOM]**

M. V. MAKASEEV Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), July-Aug. 1985, p. 64-68. In Russian. refs

The problem of bounded flow past a supercavitating finite-span wing is treated numerically using the nonlinear programming approach. The numerical method proposed here makes it possible to calculate the flow from the specified cavitation number and can be easily extended to a wide class of linear supercavitation problems that involve solving integral equations. The method is sufficiently general and accurate to be used in engineering calculations and can be readily implemented in software. V.L.

**NONSYMMETRIC SOLUTIONS IN THE PROBLEM OF FLOW PAST A PLATE WITH A PAIR OF VORTEX-SINK COMBINATIONS [NESIMMETRICHNYE RESHENIIA V ZADACHE OBTEKANIIA PLASTINKI S PAROI VIKHRESTOKOV]**

M. G. GOMAN and A. N. KHRABROV Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), July-Aug. 1985, p. 181-183. In Russian. refs

Stationary flow past a plate with a pair of free attached vortex-sink combinations is analyzed for the case of normal flow incidence. The resulting flow pattern approximately corresponds to cross-section flow in the case of separated flow past a low-aspect-ratio wing at large angles of attack. It is shown that for some values of the sink intensity, solutions with a nonsymmetric arrangement of vortex-sink combinations exist along with symmetric solutions. V.L.

**INTEGRATED FLOWFIELD ANALYSIS METHODOLOGY FOR FIGHTER INLETS**

R. R. COSNER (McDonnell Aircraft Co., St. Louis, MO) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs

(AIAA PAPER 85-3071)

A methodology has been developed to predict viscous flow over integrated fighter forebody-inlet combinations. It includes the effects of Mach number, Reynolds number, angle of attack, and engine mass flow. The analysis is based on a relaxation solution to the steady state Navier-Stokes equations, executed on a multiple-zone mesh. The solution [illegible] are affordable; the procedure can be executed on VAX-[illegible]80 computers. In this paper, computed results are compared with wind tunnel data on two contemporary aircraft: the F/A-18A and the AV-8B. Author

**NOISE FROM A CIRCULATION CONTROL WING WITH UPPER SURFACE BLOWING**

M. SALIKUDDIN, W. H. BROWN, and K. K. AHUJA (Lockheed-Georgia Co., Marietta) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. Research supported by Lockheed Independent Research and Development Program. refs

(AIAA PAPER 85-3083)

The work presented in this paper represents a first step in understanding and evaluating the noise characteristics of a circulation control wing with upper surface blowing (CCW/USB). It was found that high frequency noise was dominated by the effects of the circulation control jet and that low frequency noise was dominated by the effects of the upper surface blowing. The individual effects of the CCW and the USB can be superimposed to yield a good approximation of the resultant effect in a combined CCW/USB configuration. Author

**MAXIMUM CIRCULATION LIFT COEFFICIENT DEVELOPED ON A LOW ASPECT RATIO WING WITH A BLOWN FLAP**

V. R. STEWART (Rockwell International Corp., Columbus, OH) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-3085)

The maximum circulation lift coefficient attainable on a low aspect ratio wing is discussed by comparing test results to various theoretical studies. Several theoretical predictions have been made of the maximum circulation lift coefficient. The predicted values have ranged from 1.2 times the wing aspect ratio to 1.94 times the aspect ratio. This paper briefly examines these studies and compares the results to test data. Available data from a recent test of a low aspect ratio propulsive wing/fuselage which included surface pressure instrumentation in addition to force balance measurements are analyzed to support the conclusions. Comparisons of the force and pressure data are explored to aid in the understanding of the factors limiting the circulation lift. The test results indicate that maximum circulation lift coefficients of approximately 1.9 times the aspect ratio have been obtained on the propulsive wing configuration. Author

**LASER DOPPLER VELOCIMETER MEASUREMENTS IN A 3-D IMPINGING TWIN-JET FOUNTAIN FLOW**

K. R. SARIPALLI (McDonnell Douglas Research Laboratories, St. Louis, MO) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 14 p. Research sponsored by the McDonnell Douglas Independent Research and Development Program. refs
(AIAA PAPER 85-4036)

Mean velocity and turbulence measurements were conducted on the three-dimensional fountain flow-field generated by the impingement of two axisymmetric jets on a ground plane with application to vertical-take-off and landing (VTOL) aircraft. The basic instantaneous velocity data were obtained using a two-component laser Doppler velocimeter in a plane connecting the nozzle centerlines at different heights above the ground emphasizing the jet impingement region and the fountain upwash region formed by the collision of the wall jets. The distributions of mean velocity components and turbulence quantities, including the turbulence intensity and the Reynolds shear stress, were derived from the basic velocity data. Detailed studies of the characteristics of the fountain revealed self-similarity in the mean velocity and turbulence profiles across the fountain. The spread and mean velocity decay characteristics of the fountain were established. Turbulence intensities of the order of 50 percent were observed in the fountain. Author

**ANALYSIS OF LEADING-EDGE VORTICES ON COMPLEX CONFIGURATIONS**

J. K. NATHMAN (Analytical Methods, Inc., Redmond, WA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 11 p. refs
(AIAA PAPER 85-4054)

This paper describes the theory and application of VORSEP, a wake synthesizer for panel methods that use an iterative procedure to determine the position of strongly interacting vortex sheets. The estimation of the wake geometry is based on slender body theory with separation. An unsteady, two-dimensional airfoil program was automated with the addition of routines to interpolate cross-sectional geometry from arbitrary three-dimensional bodies, generate multi-core wakes and synthesize a three-dimensional wake structure. The method is applied to the leading-edge separation on delta and double-delta wings, the strake vortex of an STOL fighter, and the A-pillar separation on an automobile. Comparison with experimental data show results with the estimated wakes are physically more realistic than attached flow calculations and would be a suitable starting point for a three-dimensional iterative solution. In some cases, no improvement in the solution is required. Author

**A86-11027*#** North Carolina State Univ., Raleigh.

**AN EXPERIMENTAL INVESTIGATION OF APEX FENCE FLAPS ON DELTA WINGS**

R. J. VESS (North Carolina State University, Raleigh), R. A. WAHLS, and C. A. MOSKOVITZ AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 11 p. refs
(Contract NCC1-46)
(AIAA PAPER 85-4055)

The effects on leading edge vortex formation produced by apex fences mounted on two delta wings were examined in a subsonic wind tunnel. Pressure data were collected on the upper surface of the test wings and oil flow and bubble flow visualizations were performed. The deflections studied were 74, 90 and 65 deg in one-sided and two-sided configurations. Full span and semi-span delta wing planforms were used. Relatively small, symmetrically deployed apex fences provided enhanced upper surface suction which, in some angle-of-attack situations, could lead to a pitch-up force. Asymmetrically-deployed fences showed promise for yaw control at high angles of attack, althouh the force effectiveness has yet to be quantified. M.S.K.

**A86-11028#**

**A UNIQUE APPLIED COMPUTATIONAL METHOD FOR VORTEX LIFT AERODYNAMICS AND VORTEX BURST FOR ARBITRARY AIRCRAFT**

C. J. DIXON and G. T. DRISKILL (Lockheed-Georgia Co., Marietta) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 19 p. refs
(AIAA PAPER 85-4057)

This paper describes a unique method to predict the aerodynamic forces on a variety of aircraft configurations employing leading edge vortex lift. A rigorous two-dimensional solution of a combined free leading edge vortex and sink on a flat plate airfoil has been combined with a three-dimensional vortex lattice method to predict the loads and moments on the configuration and the boundary conditions for the free vortex. With these boundary conditions, the analysis includes the effects of transition of the vortex core from laminar to turbulent and subsequent burst. Two breakdown criteria are required to analyze configurations with a wide range of leading edge sweep. Reynolds number is shown to have large effects at the low values typical of smoke tunnels and water channels. Experimental data are compared with theory, showing excellent agreement prior to vortex breakdown and good agreement after breakdown. Author

**A86-11029#**

**AN EFFICIENT METHOD FOR COMPUTING UNSTEADY TRANSONIC AERODYNAMICS OF SWEPT WINGS WITH CONTROL SURFACES**

D. D. LIU (Arizona State University, Tempe), K. Y. FUNG (Arizona, University, Tucson), and Y. F. KAO AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 17 p. Navy-supported research. refs
(AIAA PAPER 85-4058)

A transonic equivalent strip (TES) method has been further developed for unsteady flow computations of arbitrary wing planforms. The TES method consists of two consecutive correction steps to a given nonlinear code such as LTRAN2; namely, the chordwise mean-flow correction and the spanwise phase correction. The computation procedure requires direct pressure input from other computed or measured data. Otherwise, it does not require airfoil shape or grid-generation for given planforms. To validate the computed results, four swept, tapered wings of various aspect ratios, including those with control surfaces, are selected as computational examples. Overall trends in unsteady pressures are established with those obtained by XTRAN3S codes, Isogai's full potential code and measured data by NLR and RAE. In comparison with these methods, the TES has achieved considerable saving in computer time and reasonable accuracy which suggests immediate industrial applications. Author

### SUBSONIC/SUPERSONIC LINEAR UNSTEADY ANALYSIS

W. CLEVER (Rockwell International Corp., Los Angeles, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 12 p.
(AIAA PAPER 85-4059)

Using an expansion in powers of reduced frequency, a linearized unsteady panel formulation is developed which is valid for both subsonic and supersonic Mach numbers. With this formulation a numerical pilot code was developed, using chord plane singularities, to analyze relatively general three-dimensional geometries for a wide range of oscillation frequencies. A constant value of unsteady Delta Cp across each panel eliminates the problem of singularities associated with control points near Mach cones emanating from panel corners, and from singularities associated with panels having sonic edges. Results from the computations indicate good agreement with a doublet lattice analysis at subsonic Mach numbers, for a nonplanar oblique wing configuration, and with an exact solution at supersonic speeds for a 60 degree delta wing. All integrations are done exactly in closed form and the technique may be expanded to more general panels of the Pan-Air type. Author

### FULL POTENTIAL AND EULER SOLUTIONS FOR THE UNSTEADY TRANSONIC FLOW PAST A FIGHTER WING

L. N. SANKAR (Georgia Institute of Technology, Atlanta), J. B. MALONE, and D. SCHUSTER (Lockheed-Georgia Co., Marietta) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 13 p. Research supported by the Lockheed-Georgia Independent Research and Development Program. refs
(AIAA PAPER 85-4061)

The problem of steady and unsteady transonic flow over modern fighter wing configurations has been addressed using two solution procedures. In the first procedure, the three-dimensional unsteady full potential equation is solved in a body-fitted coordinate system using a Strongly Implicit Procedure (SIP). In the second approach, the unsteady Euler equations are solved using a stable, hybrid numerical scheme. A number of steady and unsteady calculations are presented for a F-5 fighter wing configuration and compared with experiments. Author

### AERODYNAMIC BUGS - CAN CFD SPRAY THEM AWAY?

R. S. SHEVELL (Stanford University, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. refs
(AIAA PAPER 85-4067)

The potential for CFD techniques for eliminating aerodynamic problems in the design stage of subsonic transport aircraft is assessed. Conventional, non-CFD mathematical tools cannot accurately predict performance at stall speeds and high angles of attack, i.e., situations encountered at take-off, landing and shocked separated flow conditions. CFD allows the numerical study of previously inaccessible flight regimes, and rapid focusing on the individual effects surrounding external aircraft components. However, understanding of the fundamental flow physics will always be a cornerstone to applied aerodynamics, but is not necessarily a part of CFD, which is therefore a validation tool for designer calculations. Techniques for the fruitful interaction of the two methods are illustrated by tracing the evolution of the DC-8 airfoils to the DC-10 airfoils. M.S.K.

**A86-11037#**

### AERODYNAMIC TRADEOFF STUDY OF CONVENTIONAL, CANARD, AND TRI-SURFACE AIRCRAFT SYSTEMS

B. P. SELBERG and K. ROKHSAZ (Missouri-Rolla, University, Rolla) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 11 p. refs
(AIAA PAPER 85-4071)

Conventional, canard, and three-surface aircraft configurations are investigated analytically to determine each configuation's induced and viscous drag under trimmed conditions. A three-surface vortex lattice method is used to trim the aircraft as well as to predict the induced drag of each configuration. A vortex panel method, in conjunction with a momentum integral boundary layer method, is used to predict inviscid and viscous characteristics. Parameters varied included wing to stabilator surface area ratio, static margin, canard to tail loading ratio, and total lift coefficient trim. For all parameters considered the conventional congiguration had the highest total lift coefficient trim/induced drag coefficient. At the lower stabilator aspect ratios the conventional's total lift coefficient trim/total drag coefficient was the highest whereas for the highest stabilator aspect ratio considered the canard configuration had the highest total lift coefficient trim/total drag coefficient. The tri-surface was superior to the canard at the lower aspect ratio, with the canard becoming superior at the higher values. Author

### IMPACT OF AIRFOIL PROFILE ON THE SUPERSONIC AERODYNAMICS OF DELTA WINGS

R. M. WOOD and D. S. MILLER (NASA, Langley Research Center, Hampton, VA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 13 p. refs
(AIAA PAPER 85-4073)

A nonlinear flow model was employed to predict the flowfield, pressure and force data for delta wings at supersonic speeds. The goal of the study was to investigate the influence the airfoil profiles has on the wing aerodynamics. The analysis covers wing aspect ratios from 0.5-3.0 with leading edge sweep of 0.5-4.0 on diamond, circular arc and NACA modified 4-digit airfoils. Nonlinear aerodynamics are approximated with nonlinear zero-lift wave drag curves, yielding results significantly different from those obtained from linear calculations. The analyt[illegible] technique, useful in preliminary design studies, indicates in [illegible] cases that 90 percent of wave drag is generated at the wing apex and trailing edge. M.S.K.

### COMPUTATIONAL WING DESIGN IN SUPPORT OF AN NLF VARIABLE SWEEP TRANSITION FLIGHT EXPERIMENT

E. G. WAGGONER, R. L. CAMPBELL, and P. S. PHILLIPS (NASA, Langley Research Center, Hampton, VA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 11 p. refs
(AIAA PAPER 85-4074)

A natural laminar flow outer panel wing glove has been designed for a variable sweep fighter aircraft using state-of-the-art computational techniques. Testing of the design will yield wing pressure and boundary-layer data under actual flight conditions and environment. These data will be used to enhance the understanding of the interaction between crossflow and

Tollmien-Schlichting disturbances on boundary-layer transition. The outer wing panel was contoured such that a wide range of favorable pressure gradients could be obtained on the wing upper surface. Extensive computations were performed to support the design effort which relied on two- and three-dimensional transonic design and analysis techniques. A detailed description of the design procedure that evolved during this study is presented. Results on intermediate designs at various stages in the design process demonstrate how the various physical and aerodynamic constraints were integrated into the design. Final results of the glove design analyzed as part of the complete aircraft configuration with a full-potential wing/body analysis code indicate that the aerodynamic design objectives were met. ### A DIRECT-INVERSE TRANSONIC WING DESIGN-ANALYSIS METHOD WITH VISCOUS INTERACTIONS

L. A. CARLSON (Texas A & M University, College Station) and R. A. WEED (Lockheed-Georgia Co., Marietta) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. Research supported by the Texas A & M Research Foundation and Lockheed-Georgia Co. refs
(Contract N0167-81-C-0078-P00004)
(AIAA PAPER 85-4075)

A direct-inverse transonic wing design method which includes the effects of viscous interaction due to a turbulent boundary layer is presented. The method is based upon the fully conservative ZEBRA II transonic potential flow algorithm, uses a Cartesian-like grid system, and includes automatic relofting to control the amount of trailing edge thickness at each design station. Viscous interaction is included by a two-dimensional boundary layer scheme modified to account for the first order effects of three dimensionality. Comparisons with experimental data are presented which verify that this method improves transonic aerodynamic studies associated with preliminary design and analysis. Author

### AERODYNAMIC DESIGN CONSIDERATIONS FOR EFFICIENT HIGH-LIFT SUPERSONIC WINGS

D. S. MILLER and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-4076)

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows. Author

### EXPERIMENTAL VERIFICATION OF THREE-DIMENSIONAL TRANSONIC INVERSE METHOD

S. TATSUMI (Mitsubishi Heavy Industries, Ltd., Nagoya, Japan) and S. TAKANASHI (National Aerospace Laboratory, Tokyo, Japan) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 11 p. refs
(AIAA PAPER 85-4077)

A three-dimensional transonic wing design method was developed for wing alone and wing-body combination. The method is based on an iterative 'residual-correction' concept combined with existing three-dimensional transonic full potential flow analysis code. Transonic swept wings with specified pressure distribution were designed for typical civil transports and wind tunnel tests were conducted to verify the usefulness of the method. The comparison in pressure distribution of experimental data with design targets show satisfactory agreements, suggesting that the method provides a practical and effective tool in aerodynamic design of aircraft wings. Author

### NUMERICAL EXPERIMENT WITH INVISCID VORTEX-STRETCHED FLOW AROUND A CRANKED DELTA WING - SUBSONIC SPEED

A. RIZZI (Flygtekniska Forsoksanstalten, Bromma, Sweden) and C. J. PURCELL (ETA Systems, Inc., St. Paul, MN) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 12 p.
(AIAA PAPER 85-4080)

A numerical method that solves the Euler equations for compressible flow is used to study vortex stretching. The particular case simulated is subsonic flow with freestream M = 0.3 and alpha = 10 deg around the twisted and cambered cranked-and-cropped TKF delta wing of MBB. This geometry induces multiple leading-edge vortices in a straining velocity field that brings about flow instabilities but the result is a state of statistical equilibrium. The discretization contains over 600,000 cells and offers sufficient degrees of freedom in the solution to exhibit the onset of chaotic vortex flow that could well lead to turbulence. The simulated results are compared with wind-tunnel measurements. Author

### FLOW-FIELD COMPUTATIONS AROUND NOZZLE/AFTERBODY CONFIGURATIONS AT TRANSONIC MACH NUMBERS

U. C. GOLDBERG, J. J. GORSKI, and S. R. CHAKRAVARTHY (Rockwell International Science Center, Thousand Oaks, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 8 p. refs
(AIAA PAPER 85-4081)

The flow field around nozzle-afterbody configurations is computed using a finite volume code, incorporating a total variation diminishing implicit upwind biased scheme for high accuracy. Results are shown for two combinations of jet and freestream conditions, using the k-epsilon turbulence model, with a new near-wall treatment. Agreement with experimental data is very good. Author

**A86-11048#**

### OPTIMIZATION OF THREE-DIMENSIONAL COMPUTATIONAL GRIDS

R. CARCAILLET, S. R. KENNON, and G. S. DULIKRAVICH (Texas, University, Austin) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-4087)

A method for generating and optimizing arbitrary three-dimensional boundary-conforming computational grids has been developed. The smoothness and local orthogonality of the grid are maximized using a fast iterative procedure, and provision is made for clustering the optimized grid in selected regions. An optimal grid can be obtained iteratively, irrespective of the method used to generate the initial grid. Unacceptable grids and even singular grids (i.e., grids containing regions of overlap) can be made useful for computation using this method. Application of the method to several test cases shows that grids containing regions of overlap are typically untangled in two to five iterations, and that the conjugate gradient optimization procedure converges to an optimal grid within fifty iterations. Taking advantage of the original properties of this method, a new concept for generating optimal three-dimensional computational grids is proposed. It consists in optimizing a first guess of the desired grid, using an imperfect grid generated by a simple, inexpensive method as input. Author

**COMPUTATIONAL GRID GENERATION FOR REALISTIC AIRCRAFT CONFIGURATIONS**

D. M. SOMMERFIELD, G. S. DULIKRAVICH, and S. R. KENNON (Texas, University, Austin) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 8 p. refs
(AIAA PAPER 85-4089)

A computational technique is presented for transforming three-dimensional space into a series of two-dimensional planes for conformal mapping of flowfields around aircraft designs. The aircraft geometry is radially sheared to convert the fuselage into a circular cylinder. The lifting surfaces are thereby also radially sheared and stretched. The intersections between the computational surfaces and the distorted lifting surfaces are obtained by fitting spanwise cubic splines to chordwise locations using Newton's iteration scheme. The surfaces are unwrapped after the intersections are determined, yielding planar strips. Further computations identify the grid points for the planes, which can then be rewrapped around the physical space of interest. Sample results are provided for grids generated for the F-16 and NASA F-8 oblique wing aircraft. M.S.K.

**A86-11050#**

**AN INVESTIGATION OF GRIDDING ON THE ACCURACY OF FLO57MM AND FLO57MG EULER WING SOLUTIONS**

C. J. WOAN and E. BONNER (Rockwell International Corp., Computational Fluid Dynamics Group, Los Angeles, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 13 p. Research supported by the Rockwell International Independent Research and Development Program. refs
(AIAA PAPER 85-4090)

The impact of gridding on the solution accuracy of Jameson's wing-alone Euler codes FLO57MM and FLO57MG was evaluated for the ONERA M6 wing at a Mach number of 0.84 for an angle of attack 3.06 degrees. Axial, vertical and lateral grid sizes of 66 x 16 x 16, 96 x 16 x 16, and 96 x 24 x 24 with various degrees of clustering in the three coordinate directions were considered. Details of grid generation and spacing are given. Experimental comparisons indicate the double shocks on the wing upper surface are accurately captured for the most dense grid with suitable grid clustering, and show substantial improvement over the previously published results. Author

**COMPARISON OF RESULTS FROM A PANEL METHOD AND AN EULER CODE FOR A CRANKED DELTA WING**

L. FORNASIER (Messerschmitt-Boelkow-Blohm GmbH, Ottobrun, West Germany) and A. RIZZI (Flygtekniska Forsoksanstalten, Bromma, Sweden) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. refs
(AIAA PAPER 85-4091)

A panel code and an Euler code are evaluated as prediction tools for simulating the flow around a cranked-delta wing configuration at Mach numbers equal to 0.30, 0.90, and 1.20. Comparisons are made for global longitudinal characteristics, spanwise variations of local aerodynamic coefficients, and surface pressures. Predictions from the two codes are in good agreement with experimental data at low angles of attack for all Mach numbers studied. At higher angles of attack, the panel code is unable to simulate the phenomena related to the development of a separated leading edge vortical flow and to the formation of large regions of supercritical flow at transonic speeds. The Euler code proved to be able to predict the essential features of such nonlinear effects, especially at 10 deg angle of attack. At intermediate values where the flow is in transition from linear to shed vortex flow, the Euler code seems to overpredict the nonlinear effect. C.D.

**A86-11052#**

**EVALUATION OF FOUR PANEL AERODYNAMIC PREDICTION METHODS (MCAERO, PAN AIR, QUADPAN, AND VSAERO)**

W. Z. STRANG, C. H. BERDAHL, E. L. NUTLEY, and A. J. MURN (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 17 p. refs
(AIAA PAPER 85-4092)

Four linearized potential panel codes are compared using three test cases having datum solutions. The test cases are a simple wing, a straked-wing, and a nacelle. Each code predicts similar flow, but VSAERO and QUADPAN usually 'leak' more and predict lower section loading than PAN AIR and MCAERO. Execution times and user friendliness are compared. Although all four codes solve the linearized potential flow about a vehicle, each code has unique features which may influence a prospective user's choice of a code for flow analysis or vehicle design. Author

**A TECHNIQUE FOR THE INVERSE AERODYNAMIC DESIGN OF NACELLES AND WING CONFIGURATIONS**

J. B. MALONE, J. VADYAK (Lockheed-Georgia Co., Marietta, GA), and L. N. SANKAR (Georgia Institute of Technology, Atlanta, GA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. refs
(AIAA PAPER 85-4096)

A semi-inverse design algorithm is presented which is based on the well-known Garabedian-McFadden procedure. The modified inverse algorithm permits the design of aerodynamic components with prescribed surface pressures. Details of the present design procedure are given and several examples illustrating the use of the design technique with existing aerodynamic analysis methods are discussed. Computed results for sample design problems are presented for 2-D airfoils, 2-D nacelle inlets, and 3-D nacelle configurations. Author

**A86-11055#**

**THE CONCEPT OF LATERAL BLOWING**

D. A. TAVELLA and L. ROBERTS (Stanford University, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-5000)

The concept of lateral blowing consists in utilizing thin jets of air, which are ejected in the spanwise direction from slots at the tips of straight or swept wings to generate aerodynamic forces without the assistance of deflecting solid surfaces. For weak intensities of blowing the so-generated forces could be used for roll and lateral control of aircraft. In this work a theory for this concept as applied to straight wings is presented, revealing the analytical relationship between blowing and aerodynamic forces. The approach is based on perturbing the span of an elliptically loaded wing. Scaling laws involving blowing intensity, aspect ratio, and angle of attack are derived and compared with experiments. It is concluded that this concept has potential as a novel roll and lateral control device. Author

**A86-11056#**

**INFLUENCE OF TIP BLOWING ON RECTANGULAR WINGS**

D. A. TAVELLA, N. J. WOOD, and P. HARRITS (Stanford University, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-5001)

The aerodynamics of a rectangular wing with a jet exhausting in the spanwise direction from the tips has been explored experimentally. By effectively changing the span of the wing as well as outwardly displacing the tip vortices, such jets can induce aerodynamic forces that could be used for roll and lateral control of aircraft. The concept has been investigated for a variety of jet intensities, aspect ratios and angles of attack. The results appear to confirm theoretically predicted scaling laws for lift and moment gains due to blowing. Author

### FLOW SIMULATIONS FOR DETAILED NACELLE-EXHAUST FLOW USING EULER EQUATIONS

H. C. CHEN, K. KUSUNOSE, and N. J. YU (Boeing Commercial Airplane Co., Seattle, WA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 8 p. refs
(AIAA PAPER 85-5003)

A simulation method for the detailed analysis of nacelle exhaust flowfields based on Jameson et al. (1981) Euler technology has been presented. An axisymmetric code and a general three-dimensional (3-D) code have both been developed. The axisymmetric version is particularly useful for fundamental studies such as grid density requirements, whereas the 3-D version is particularly suited for real applications involving nonaxisymmetric geometry and angle-of-attack effects. The addition of one-plane-of-symmetry to the 3-D code enhances its usefulness by doubling the number of available grid points. Reasonable agreement has been obtained in test-theory comparison for both axisymmetric and 3-D cases. The analysis of a transport nacelle at high power setting reveals complex expansion-compression flow patterns in the exhaust flow region. Author

### TRANSONIC SEPARATED SOLUTIONS FOR AN AUGMENTOR-WING

J. FLORES and W. R. VAN DALSEM (NASA, Ames Research Center, Moffett Field, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 11 p. refs
(AIAA PAPER 85-5004)

The viscous transonic flow about a multielement airfoil (augmentor-wing) is simulated by coupling full-potential and direct/inverse differential boundary-layer algorithms. Solutions have been obtained for a variety of conditions and are in fair agreement with available experimental data. Typical results from this transonic augmentor-wing code (TAUG-V) require approximately three minutes of CRAY-XMP CPU time. Since this viscous transonic code accounts for most of the important flow physics, yet is still economical, it is a practical tool for the design aerodynamicist. Author

### LEADING EDGE FLAP PLANFORM EFFECTS FOR WINGS OF MODERATE LEADING EDGE SWEEP

A. C. GRANTZ (Northrop Corp., Aircraft Div., Hawthorne, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 18 p. refs
(AIAA PAPER 85-5005)

A low-speed wind tunnel investigation was conducted which addressed the effects of leading edge flap area, flap deflection, and flap hinge-line sweep for wings of moderate (40 to 55 degrees) leading edge sweep. Oil flow visualization photographs and VLM-SA comparisons were made for selected configurations. Leading edge flaps of conventional taper were shown to provide higher L/D than flaps of constant chord and inverse taper planforms for wings with a leading edge sweep angle of 50 degrees. In all cases, the 14 and 17 percent area leading edge flaps yielded the best L/D performance at moderate to high lift coefficients independent of wing leading edge sweep angle. Despite the mixed, attached and vortical flowfields produced by the leading edge flaps investigated, the VLM-SA calculations agreed very well with the experimental drag polars. Author

### SYMMETRIC SEPARATED FLOW PAST SLENDER BODIES AT ANGLES OF ATTACK IN SUBSONIC AND SUPERSONIC FLOWS

A. K. SREEKANTH (Indian Institute of Technology, Madras, India) and S. PANNEERSELVAM (Defence Research Development Laboratory, Hyderabad, India) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-5007)

A prediction method has been developed for determining the normal force and pitching moment on bodies of revolution both in subsonic and supersonic flows at angles of attack up to the onset of asymmetric vortex shedding. The analysis assumes that the force on the body is the sum of inviscid and viscous contributions. Woodward's three dimensional panel method is used for inviscid flow calculations. In the viscous analysis the contributions from the shed vortices and the feeding sheet are accounted for separately. Comparisons are made of the predicted values with available experimental data on a representative ogive cylinder body. Author

**A86-11063#**

### COMPARISON BETWEEN EXPERIMENTAL AND COMPUTATIONAL RESULTS FOR AIRFOILS EQUIPPED WITH A SPOILER AND A FLAP

M. COSTES (ONERA, Chatillon-sous-Bagneux, France) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 7 p. Research supported by the Service Technique des Programmes Aeronautiques and DRET.
(AIAA PAPER 85-5008)

A computer code including viscous effects by strong coupling is used to compute the steady flow around an airfoil equipped with a spoiler. Comparison with experimental data shows that the code is able to predict, at least qualitatively, the influence of aerodynamic and geometric parameters such as free stream Mach number. spoiler deflection, spoiler chord, spoiler position, trailing edge flap deflection, Reynolds number. Author

### NUMERICAL STUDY OF THREE-DIMENSIONAL TURBULENT FLOW INTERACTIONS BETWEEN BLOCKAGE MODELS AND WIND TUNNELS INCLUDING LONGITUDINALLY SLOTTED TEST SECTIONS

S.-J. LIN and R. LEVY (Scientific Research Associates, Inc., Glastonbury, CT) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 14 p. refs
(Contract NAS3-24224)
(AIAA PAPER 85-5017)

A spatial forward-marching approach is applied to compute three-dimensional turbulent flows for several blockage models in free flight, in a solid wall wind tunnel, and in a wind tunnel with longitudinal slots in the test section. The effects of area blockage in the tunnel, model growth and tunnel wall boundary layers, and of the slots are included. The large blockage models are found to have significant wall interference effects which can be reduced by the slots. The effects of the latter are confined to the region near the tunnel wall. Model/wall interference effects are not limited to the effects of area blockage; in particular, boundary layer profile shapes for a wind tunnel model in a tunnel are different from shapes for a model in free flight even when slots are used. This indicates that the flow responds differently in these two cases with the same pressure gradient. C.D.

**A86-11066#**

### COMPUTATIONAL ESTIMATIONS OF STRUT SUPPORT INTERFERENCE AT TRANSONIC MACH NUMBERS

N. E. SUHS (Calspan Corp., Arnold Air Force Station, TN) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 7 p. refs
(AIAA PAPER 85-5018)

A computational method is presented that numerically quantifies the interference of model support struts in transonic wind tunnel tests. The method solves the three-dimensional Euler equations for a wing/body/strut model configuration in a typical wind tunnel installation. Computations and measurements are in good agreement over the range of transonic Mach numbers. Author

**A86-11067#**

### APPLICATION OF EXPERIMENTAL AND THEORETICAL METHODS TO VALIDATE RESULTS OBTAINED ON AN ISOLATED INLET COWL WIND TUNNEL TEST RIG

E. C. CARTER and W. HIRST (Aircraft Research Association, Ltd., Bedford, England) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. refs
(AIAA PAPER 85-5019)

Recent analysis of results obtained on a cowl inlet test rig in a transonic test section indicated some doubt over the standard corrections to free stream Mach number which were used to allow for the effects of rig blockage and interference. Investigative tests of tunnel flow have been made and these results, together with correlations with current theory have indicated that early interference corrections to M have been underestimated. This paper describes the steps in the investigation, the justification for the new correction terms and the reasons for the original errors. The work shows how the development of improved CFD methods can be incorporated with experimental data to improve the quality of tests. Author

**A86-11068#**

### ESTIMATING WATER VAPOR CONDENSATION EFFECTS FOR TRANSONIC AND SUPERSONIC FLOW FIELDS

C. E. ROBINSON, R. C. BAUER (Calspan Corp., Arnold Air Force Station, TN), and R. H. NICHOLS (USAF, Arnold Engineering Development Center, Arnold Air Force Station, TN) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 8 p. refs
(AIAA PAPER 85-5020)

A computer code has been developed which estimates the effect of water vapor condensation on flow fields using the Euler equations. The program computes the effect by including the energy release attributable to condensation in the energy equation. In this manner, the local effect of condensation is included in the calculation of the flow-field properties. A species equation for the conservation of water vapor is also included as well as an empirical method of predicting the onset of condensation. To evaluate the effectiveness of the code, calculations of the transonic flow field about a two-dimensional airfoil and the flow in two planar two-dimensional supersonic nozzles have been made at discrete values of specific humidity. The effects of local condensation estimated by the code are in good agreement with the experimental data found in the literature for nozzle flows. Author

### NUMERICAL SIMULATION OF TRANSONIC FLOW OVER POROUS AIRFOILS

C.-Y. CHOW (Colorado, University, Boulder, CO), T. L. HOLST, W. R. VAN DALSEM (NASA, Ames Research Center, Moffett Field, CA), and C.-L. CHEN AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. Previously announced in STAR as N85-27828. refs
(Contract NCC2-355)
(AIAA PAPER 85-5022)

A numerical study was made to examine the effect of a porous surface on the aerodynamic performance of a transonic airfoil. The pressure jump across the normal shock wave on the upper surface of the airfoil was reduced by making the surface below the shock porous. The weakened shock is preceded by an oblique shock at the upstream end of the porous surface where air is blown out of the cavity. The lambda shock structure shown in the numerical result qualitatively agrees with that observed in the wind tunnel. According to the present analysis, the porous airfoil has a smaller drag and a higher lift than the solid airfoil. Author

**A86-11071#**

### COMPARISON OF TRANSONIC AIRFOIL CHARACTERISTICS BY NAVIER-STOKES COMPUTATION AND BY WIND TUNNEL TEST AT HIGH REYNOLDS NUMBER

J. MIYAKAWA (Mitsubishi Heavy Industries, Ltd., Aerodynamic Research Section, Nagoya, Japan), N. HIROSE, and N. KAWAI (National Aerospace Laboratory, Tokyo, Japan) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. refs
(AIAA PAPER 85-5025)

Two-dimensional Navier-Stokes code (NSFOIL) is validated in terms of analysis of practical transonic advanced technology airfoil compared to wind tunnel test. The comparison is carried out at high Reynolds number of 23 million which is corresponding to actual flight condition of a transonic transport aircraft. The agreements are satisfactory in both aerodynamic forces and pressure coefficients so that the code is concluded to be a very effective tool to predict non-linear characteristics of transonic airfoils, which has never been possible by any inviscid code. In the course of the careful comparison process, some future improvements of the code are probed in order to get even better simulation by this hopeful computer code. Author

**A86-11072#**

### THE USE OF NUMERICAL OPTIMIZATION FOR AIRFOIL DESIGN

J. RENEAUX and J.-J. THIBERT (ONERA, Chatillon-sous-Bagneux, France) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 11 p. refs
(AIAA PAPER 85-5026)

The paper describes an airfoil design method based on numerical optimization techniques. This method allows the design of airfoils with certain aerodynamic objectives and with respect to geometric or aerodynamic constraints. After a presentation of the method, the paper describes different applications. Airfoil design processes for ultralight aircraft, for propeller and helicopter blades and for shrouded tail rotor are explained and the performances of these airfoils are given. The new airfoils designed using this method perform better than other known airfoils which demonstrates the efficiency of the numerical optimization technique. In conclusion, some remarks concerning the disadvantages of the method are presented as well as its possible use for other aerodynamic applications. Author

**A86-11073#**

### THE SEPARATED AND NON-SEPARATED AIRFOIL WAKE BEHAVIOR IN THE PRESENCE OF FREE STREAM TURBULENCE

M. ARDEBILI, B. K. HAZARIKA, and R. RAJ (City College, New York) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. refs
(AIAA PAPER 85-5027)

The wake of a cambered airfoil was measured at three angles of attack and at two free stream turbulence levels. At high angle of attack and low free stream turbulence level a separation bubble was observed on the airfoil surface. Separation bubble was removed with the increase of free stream turbulence and the results were compared. The experimental results obtained were also empirically correlated for predicting the mean wake properties. Author

**AERODYNAMIC INTERACTION BETWEEN VORTICAL WAKES AND THE VISCOUS FLOW ABOUT A CIRCULAR CYLINDER**

P. M. STREMEL (NASA, Ames Research Center, Moffett Field, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 19 p. refs
(AIAA PAPER 85-4063)

In the design analysis of conventional aircraft configurations, the prediction of the strong interaction between vortical wakes and the viscous flow field about bodies is of considerable importance. Interactions between vortical wakes and aircraft components are even more common on rotorcraft and configurations with lifting surfaces forward of the wing. An accurate analysis of the vortex-wake interaction with aircraft components is needed for the optimization of the payload and the reduction of vibratory loads. However, the three-dimensional flow field beneath the rotor disk and the interaction of the rotor wake with solid bodies in the flow field are highly complex. The present paper has the objective to provide a basis for the considered interactions by studying a simpler problem. This problem involves the two-dimensional interaction of external wakes with the viscous flow about a circular cylinder. G.R.

**LIFTING SURFACE THEORY FOR A HELICOPTER ROTOR IN FORWARD FLIGHT**

H. TAI (NASA, Langley Research Center, Hampton, VA) and H. L. RUNYAN (College of William and Mary, Hampton, VA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 11 p. Previously announced in STAR as N85-10916. refs

A lifting surface theory was developed for a helicopter rotor in forward flight for compressible and incompressible flow. The method utilizes the concept of the linearized acceleration potential and makes use of the vortex lattice procedure. Calculations demonstrating the application of the method are given in terms of the lift distribution on a single rotor, a two-bladed rotor, and a rotor with swept-forward and swept-back tips. In addition, the lift on a rotor which is vibrating in a pitching mode at 4/rev is given. Compressibility effects and interference effects for a two-bladed rotor are discussed. Author

**A86-11226#**

**AIRFOIL DYNAMIC STALL PERFORMANCE WITH LARGE-AMPLITUDE MOTIONS**

M. S. FRANCIS and J. E. KEESEE (USAF, Office of Scientific Research, Washington, DC) AIAA Journal (ISSN 0001-1452), vol. 23, Nov. 1985, p. 1653-1659. refs
(Contract AF PROJECT 2307; AF TASK F1)

Dynamic lift levels approaching three times the corresponding quasisteady maximum values have been observed to occur and sustain to very high incidence angles (60 deg) when airfoils undergo rapid, large-amplitude pitchup motions at constant rate. Measurements of unsteady surface pressure distributions on two different airfoil shapes have captured the footprint of an energetic separation vortex which originates at the leading edge and exerts a substantial influence on the loading history as it convects downstream. To evaluate the potential of exploiting lifting surface motions as a possible means of load enhancement and control, a dimensionless impulse function that is not dependent on the type of motion is introduced and applied to experimental data. Results suggest that optimum lift performance can be achieved at relatively low pitch rates when the motion is terminated at the rate-determined angle at which the dynamic lift coefficient reaches its maximum value. Author

**A86-11227#**

**THE PITCHING DELTA WING**

M. GAD-EL-HAK and C.-M. HO (Flow Research Co., Kent, WA) AIAA Journal (ISSN 0001-1452), vol. 23, Nov. 1985, p. 1660-1665. refs
(Contract F49620-80-C-0020)

Delta wings in steady flow can provide high lift at large angles of attack and are therefore used on many high-performance aircrafts. However, the unsteady aerodynamic properties of a delta wing are practically unknown, although vital for operating and designing airplanes for poststall and other maneuvering. In this study, the flowfields around to pitching delta wings with apex angles of 90 and 60 deg were visualized in a towing tank at chord Reynolds numbers up to 350,000. The reduced frequency was varied in the range 0.05-3. The leading-edge separation vortex went through a growth-decay cycle with hysteresis during a pitching period. A distinct change of the separated flow was observed at a reduced frequency around pi. Author

**FINITE DIFFERENCE SOLUTIONS OF THE EULER EQUATIONS IN THE VICINITY OF SHARP EDGES**

P.-M. HARTWICH (NASA, Langley Research Center, Hampton, VA) AIAA Journal (ISSN 0001-1452), vol. 23, Nov. 1985, p. 1820-1822. refs

Attempts have been made to explain why finite difference solutions of the Euler equations can describe flows with large vortical structures around sharp-edged bodies. The present paper is concerned with the influence of a singular sharp edge on the truncation error for a set of discretized Euler equations. An analysis is conducted of the distribution of the truncation error of one finite difference approximation of the Euler equations near a sharp edge of a thin plate. The analysis leads to a determination of the size of the region of the neighborhood of such a singularity. Attention is given to the consistency of a discretization of the Euler equations, and numerical experiments. G.R.

**A COUPLED INVERSE-INVERSE METHOD FOR OVER-EXPANDED SUPERSONIC NOZZLES**

G. MEAUZE and A. FOURMAUX (ONERA, Chatillon-sous-Bagneux, France) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 45-49. refs
(ONERA, TP NO. 1985-109)

An inverse-inverse coupling method is proposed for taking into account internal flow separations occurring in supersonic nozzles in overexpanded regimes. First, various coupling techniques are briefly reviewed, and a justification is given for the proposed approach. The application to supersonic nozzles is then discussed in more detail, with computations for different overexpanded configurations included. V.L.

**JET PLUME TEMPERATURE EFFECTS ON AFTERBODY PRESSURE DISTRIBUTION AND DRAG**

N. B. MATHUR and K. S. YAJNIK (National Aeronautical Laboratory, Bangalore, India) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 50-55. refs

Experiments have been carried out on an axisymmetric configuration with a circular arc boattailed afterbody to study the jet plume temperature effects on afterbody pressure distribution and drag. It is found that the jet plume temperature systematically affects afterbody pressure distribution and that the afterbody drag decreases with increasing jet plume temperature. At Mach 0.62 and a jet pressure ratio of 2.9, the afterbody pressure drag coefficient at a jet temperature of 945 K is 30-40 percent less than its value at a jet temperature of 307 K (cold jet). V.L.

**THE SHOCK PATTERNS IN THE TWO-DIMENSIONAL INLET WITH A BLEED**

J. B. XING and C. M. CHANG (Beijing Power Plant Research Laboratory, People's Republic of China) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 111-117.

The various shock patterns in the two-dimensional inlet with a bleed slot located in front of a geometric throat were recorded by means of TV tapes. The downstream static pressure was measured to determine the relationship between the total pressure recovery (Po) and the mass flow ratio (Fi). The results indicated that, as the downstream pressure varied, the variations in the terminal shock wave system and of the Po are continuous for this type of inlet. The analysis of the Po and Fi relationship has shown that the relationship is single and continuous. The various patterns of the terminal shock wave system in conditions of different Mach numbers ahead of the geometric throat are discussed. I.S.

**THREE-DIMENSIONAL FLOW EFFECTS IN A TWO-DIMENSIONAL AIR INTAKE WITH MIXED SUPERSONIC COMPRESSION**

S. A. FISHER (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 118-124. refs

The internal flow in a two-dimensional mixed compression intake having focussed internal compression was examined experimentally at its design Mach number of 3.05, using pressure instrumentation and flow visualization. A pair of streamwise vortices was identified, which apparently resulted from interaction of the sidewall boundary layers with the internal shock system and which, depending on detailed geometry, could dominate the flow in the subsonic diffuser. It is argued that similar flows could exist in a variety of intakes designed for supersonic flight, with implications for both turbine and ram compression engine applications. Author

**NUMERICAL SIMULATION OF SELF-EXCITED OSCILLATIONS IN A RAMJET INLET-DIFFUSER FLOW**

T. HSIEH (U.S. Navy, Naval Surface Weapons Center, Silver Spring, MD) and T. COAKLEY (NASA, Ames Research Center, Moffett Field, CA) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 149-156. Navy-sponsored research. refs

This paper describes numerical simulations of self-excited oscillations in a two-dimensional transonic inlet-diffuser flow by solving the Navier-Stokes equations with a two-equation turbulence model. The calculated amplitudes of oscillations for the terminal shock and the velocity fields compare well with experimental measurements; however, the predicted frequency of oscillations is about 50 percent higher. The formation of a pair of downstream-traveling, counter-rotating vortices at each cycle of velocity fluctuations, as reported experimentally, is vividly revealed by the numerical results. Author

**CALCULATION OF EXTERNAL AND INTERNAL TRANSONIC FLOW FIELD OF A THREE-DIMENSIONAL S-SHAPED INLET**

H. SHEN, L. SHIJUN, M. JI, and Z. XING (Northwestern Polytechnical University, Xian, Peoples Republic of China) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 157-162. refs

A procedure for the numerical solution of the transonic flow about a three-dimensional s-shaped inlet was developed by the hybrid use of two methods: the mixed finite difference method (FDM) and the sweep finite element method (SFEMK). The FDM of the velocity potential equations, applicable to cylindrical ora Cartesian mesh, irrotational schemes and boundary-continuation methods, is used to calculate the external and internal flow fields of a three-dimensional inlet. Then the SFEM is used to improve the accuracy of the computed values of field variables at an embedded domain near the lip of the inlet. The hybrid method was used to combutate the flow about an s-shaped inlet with free stream Mach number 0.8 at different angles of attack. The results were in excellent agreement with the experimental data and with those computed by the perturbation method of Lin (1984). I.S.

**MODERN TECHNOLOGY APPLICATION TO COMPRESSOR AND TURBINE AERODYNAMICS**

J. HOURMOUZIADIS and H.-J. LICHTFUSS (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 307-320. refs

The historical evolution of compressor and turbine design has led to a situation in which the methods used for the analysis of compressor characteristics are different from the approaches employed for turbines. However, as actually the fundamental phenomena involved in both cases are the same, compressor and turbine design systems tend to converge to one single turbomachinery design system. In the near future, transonic and supersonic flow will become dominant in the next generation of turbomachinery for airbreathing engines. Turbomachinery design systems are discussed, taking into account annulus and velocity-triangle design, blade to blade analysis, and three-dimensional analysis and design. It is pointed out that turbomachinery design is becoming an integral part of the engine computer-aided design system. Aspects of experimental research and development are also discussed, giving particular attention to measurement techniques. G.R.

**AN EXPERIMENTAL STUDY OF THE COMPRESSOR ROTOR FLOW FIELD AT OFF-DESIGN CONDITION USING LASER DOPPLER VELOCIMETER**

P. POPOVSKI and B. LAKSHMINARAYANA (Pennsylvania State University, University Park) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 321-330. refs

The measurement of the flow field at the peak pressure rise condition in an axial flow compressor rotor is reported in this paper. The inviscid flow measurement was carried out using a laser Doppler velocimeter and the blade boundary layers were measured using a two sensor hot wire probe. The blade to blade distribution of velocities at several axial and radial locations are plotted, interpreted, and compared with the conditions existing at a lower (design) flow coefficient. The leading edge effects on inviscid flow is found to be appreciable. The flow field is dominated by inviscid flow at most radial locations, and the blade boundary layers thickness is found to be appreciable in the tip region. The flow near the tip is dominated by the leakage flow and its influence is more severe at the peak pressure rise condition. Author

### DEVELOPMENT OF A SHORT RADIAL DIFFUSER IN THE HIGH SUBSONIC AND SUPERSONIC RANGE WITH SPECIAL APPLICATION TO AIR BREATHING ENGINES

W. WAWSZCZAK (Calgary, University, Canada) and J. DE KRASINSKI IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 344-350. NSERC-sponsored research. refs

This paper describes the experimental research done on a very short, axially symmetrical diffuser. This diffuser, developed originally for low speed, has been redesigned for high subsonic and supersonic ranges with the objective of meeting high efficiency and low aerodynamic noise criteria. Besides the classical boundary layer concepts required to avoid separation, general trends following from Lighthill's concepts of aerodynamically generated sound were also adopted. The results are more than encouraging. Shortness, high efficiency and almost complete noise abatement have been achieved. Author

### TURBULENT BOUNDARY LAYER SEPARATION ON ENGINE COMPONENTS

W. H. SCHOFIELD (Aeronautical Research Laboratories, Melbourne, Australia) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 631-639. refs

A unified description of the entire separating turbulent flow field is presented by coupling a proposed description for the mean velocity profile of turbulent boundary layers (b.l.s.), in flow approaching separation, during separation, and downstream after separation, and an empirical formulation for the mean reversed flow profile. It was found that the velocity profiles in adverse pressure gradient b.l.s. defined by Schofield and Perry (1972, 1973) can be extended to separating and separated layers, provided that the effective origin of the layer is relocated. It is proposed that turbulent b.l.s. separate with a universal mean velocity profile, which can be defined by a standard shape factor (displacement to momentum thickness ratio) of 3.3. The application of this theory to practical b.l.s. with three-dimensional components is discussed. I.S.

### THE GOVERNING INFLUENCE OF THE NOSE RADIUS ON THE UNSTEADY EFFECTS OF LARGE SCALE FLOW STRUCTURE IN THE TURBULENT WING AND PLATE JUNCTION FLOW

E. P. ROOD (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) IN: Forum on unsteady flow; Proceedings of the Winter Annual Meeting, New Orleans, LA, December 9-14, 1984 . New York, ASME, 1984, p. 7-9.

Experimental results are reported from trials to quantify the effects of two values of the ratio of the nose radius to the boundary layer thickness (RTBL). The studies were conducted with a wing section attached to a rigid plate, with data taken one chord length downstream from the wing, which was at a 5.0 deg angle of attack. The flow velocity was 30 m/sec. Values of the RTBL of 0.12 and 0.71 were examined. The wing nose radius had a significant effect on the across-stream unsteady flow spatial pattern produced by convective structures at the downstream interaction between the boundary layer and wake. The nose radius also influences the location and skew of the surface dividing unsteady flows from the two sides of the wing. M.S.K.

### CRITICAL EXAMINATION OF TURBULENCE MODELS FOR A SEPARATED THREE DIMENSIONAL TURBULENT BOUNDARY LAYER

R. SCHMITT (ONERA, Chatillon-sous-Bagneux, France) and R. ABID La Recherche Aerospatiale (English Edition) (ISSN 0379-380X), no. 6, 1984, p. 1-17. refs

Four turbulence models are evaluated in comparisons with experimental data on the evolution of a three-dimensional boundary layer to separation. Attention is given to an algebraic mixing length theory, a kinetic energy-dissipation rate (k-e) model, an algebraic stress model (ASM), and a model comprising four transport equations. Solutions are obtained by a finite difference technique in an inverse mode. The mixing length model consistently overestimates the growth of shear stresses once destabilization is initiated. The ASM is the only model which correctly portrays the changes in shear stresses observed, and also the associated lag phenomena and velocity profiles. Further work is still necessary to model the wall flow. M.S.K.

### A VORTEX POINT METHOD FOR CALCULATING INVISCID INCOMPRESSIBLE FLOWS AROUND ROTARY WINGS

B. CANTALOUBE (ONERA, Chatillon-sous-Bagneux, France) and S. HUBERSON (CNRS, Paris, France) La Recherche Aerospatiale (English Edition) (ISSN 0379-380X), no. 6, 1984, p. 19-31. refs

An integral method is presented for calculating incompressible inviscid unsteady flow around thin bodies in arbitrary motion, i.e., rotor blades in motion with respect to one another. Because an integral method is used, discretization is limited to the solid boundaries and the vortices. Boundary conditions are treated in terms of equation for the slipstream on the walls, the vorticity vector, a volume integral for the vorticity and a first-order Fredholm integral. The Helmholtz equation governs the evolution of vorticity, which forms a sheet of doublets. The pressure jumps on the blades are covered by the unsteady Bernoulli equation. Applications of the method to helicopter rotors, medium- and high-aspect ratio propellers and low-aspect ratio nautical propellers are demonstrated. M.S.K.

**A86-12022#**

### EFFECT OF THE REYNOLDS NUMBER ON THE AERODYNAMIC CHARACTERISTICS OF AN OGIVE-CYLINDER AT HIGH ANGLE OF ATTACK

P. CHAMPIGNY (ONERA, Chatillon-sous-Bagneux, France) La Recherche Aerospatiale (English Edition) (ISSN 0379-380X), no. 6, 1984, p. 33-41. refs

Low-speed wind tunnel data for an ogive model at high angles of attack (AOA) are analyzed in terms of the flow separation regimes. The flows covered the Re range of 280,000-2 million, AOAs up to 80 deg and a Mach 0.35 flow velocity. The sting-mounted model was instrumented with 354 pressure taps. The data were used to calculate the normal and side forces. The drag coefficient was found to be dependent on the Re and the AOA. Both laminar and turbulent flows produced large side forces, which had cyclic distributions. Finally, the separations that occurred produced four types of flows for separate Re regimes. M.S.K.

**A86-12024#**

### DYNAMIC STALL MODELING OF THE NACA 0012 PROFILE

D. PETOT (ONERA, Chatillon-sous-Bagneux, France) La Recherche Aerospatiale (English Edition) (ISSN 0379-380X), no. 6, 1984, p. 55-58. refs

Correlations obtained by ONERA researchers in studies of large amplitude oscillations in airfoils are discussed. The correlation

values were generated with a dynamic model for helicopter rotor blades experiencing nonlinear oscillations in the lift/angle of attack or moment/angle of attack hysteresis loops. Comparisons were made between the model predictions and data from NASA experiments with NACA 0012 airfoils at varying angles of attack, amplitudes and frequencies. The model proved adequate for predicting the hysteresis loops and in identifying stall behavior.
M.S.K.

**THREE-DIMENSIONAL SOLUTIONS TO THE EULER EQUATIONS WITH ONE MILLION GRID POINTS**
A. RIZZI (Flygtekniska Forsoksanstalten, Bromma, Sweden) Communications in Applied Numerical Methods (ISSN 0748-8025), vol. 1, Sept. 1985, p. 193-198. Research supported by the Control Data Corp. refs

Three dense-mesh solutions are presented. The first solution, for the M6 wing (Mach 0.84, alpha 3.06 deg), shows only slight improvements in accuracy in comparison with earlier standard-mesh solutions. The other two solutions, for subsonic and supersonic flow around the 70-deg swept Dillner wing, reveal flow fields of much more complex expansion and compression phenomena than do the standard-mesh solutions. In both cases, weak and local shock waves interact with the vortex over the wing. The sequence of lift and drag coefficients is presented for three levels of grid density, 33 x 11 x 15 (coarse), 65 x 21 x 29 (standard), and 193 x 57 x 97 (dense).

**STRUCTURE AND DECAY OF SECONDARY FLOW IN THE DOWNSTREAM OF A CASCADE**
T. KAWAI, T. ADACHI (Tsukuba, University, Sakura, Japan), and K. AKASHITA (Nissan Motor Co., Ltd., Yokosuka, Japan) JSME, Bulletin (ISSN 0021-3764), vol. 28, Aug. 1985, p. 1642-1650. refs

An experimental investigation has been done on trailing and passage vortices downstream of a decelerating cascade. Hot wire traverses gave distributions of secondary flow velocities and streamwise vorticities at four axial locations. A spanwise distribution of passage circulations per unit span agrees well with a prediction by an inviscid classical secondary flow theory. The trailing vortex is well approximated by a vortex sheet immediately downstream of the blade, beginning to roll up at the position of maximum circulation per unit span. It develops into an almost axisymmetric vortex two chord lengths downstream. The trailing vortex decays faster in the vicinity of the blade trailing edge but more slowly far downstream, than the passage vortex does. The experimental trailing vortex is generated very far away from an endwall as compared with a theoretical position, exerting significant influences on the maximum underturning and the pitch-averaged streamwise vorticity in the main flow region.

**A STUDY OF AERODYNAMIC PERFORMANCE OF DIFFUSERS FOR CENTRIFUGAL COMPRESSORS**
Y. YOSHINAGA, H. KOBAYASHI (Hitachi, Ltd., Mechanical Engineering Research Laboratory, Tsuchiura, Japan), and T. KANEKI (Hitachi, Ltd., Tsuchiura, Japan) JSME, Bulletin (ISSN 0021-3764), vol. 28, Aug. 1985, p. 1651-1658. refs

The performance of vaneless diffusers and the flow distribution discharged from the impellers of various specific speed centrifugal compressors were studied. The experimental results of 18 different stages showed that the impeller exit flow distortion in the axial direction increased with an increase in specific speed, and the pressure recovery of vaneless diffusers for high specific speed compressors was extremely low compared with the value expected by an ideal two-dimensional analysis. New type diffusers with half guide vanes on the shroud sidewall are proposed to improve the pressure recovery of the diffuser under the distorted inlet flow condition. The results show that the pressure recovery of the diffuser under distorted inlet flow is considerably improved by half guide vanes, and the best height of the guide vanes is a little less than half the diffuser width.

**CHARACTERISTICS OF THE FLOW AROUND RECTANGULAR CYLINDERS - THE CASE OF THE ANGLE OF ATTACK 0 DEG**
T. IGARASHI (Defense Academy, Yokosuka, Japan) JSME, Bulletin (ISSN 0021-3764), vol. 28, Aug. 1985, p. 1690-1696. refs

Experimental investigations on the characteristics of the flow around rectangular cylinders were carried out in the range of subcritical Reynolds numbers. The width-to-height ratio (C/d) of the sections was varied from 0.1 to 4.0. The fluctuating pressure coefficient has a maximum in the same tendency as that of the drag coefficient when C/d = 0.67. The differences in flow patterns between two critical values of the ratios C/d = 0.67 and 2.8 become clear. The flow around the cylinder with arc-like leading-edge corners has been found to agree closely with that around the cylinder with a larger value of the ratio of C/d.

**REPRESENTATION OF A TURBINE PROFILE IN THE FORM OF A BEZIER CURVE [PREDSTAVLENIE TURBINNOGO PROFILIA V FORME KRIVOI BEZ'E]**
B. KH. PERELSHTEIN and S. S. SOLOVEV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 91-94. In Russian. refs

A method for representing plane turbine profiles by a Bezier curve has been developed as part of an effort to create graphics software support for a computer-aided design system. The shape of the curve is determined by the position of the vertices of the corresponding polyhedron. A change in the coordinates of the vertices leads to a gradual change in the shape of the curve, which makes it possible to optimize the profile and eventually the blading surfaces of turbomachines when using three-dimensional gasdynamic models. The representation of an aerodynamic curve in the form of a Bezier curve provides a good intuitive relation between the curve and the reference points, which is important when changes are made directly in the graphic image in an interactive manner. **SECOND ORDER APPROXIMATION METHOD FOR TRANSONIC FLOWS OVER SWEPT WINGS**

S. KEYANG (Shanghai Aviation Industry Corp.) *In its* Acta Aeron. and Astronautica Sinica (FTD-ID(RS)T-1120-84) p 1-17 4 Oct. 1984 refs Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 4, 1983 p 1-10
Avail: NTIS HC A04/MF A01 CSCL 01A

The TSDH equation is used to calculate the transonic flows over three dimensional swept wings. It considers the leading edge boundary conditions and leading edge velocity potential equation suitable for the blunt leading edge of wings. The expanded form of the Jameson scheme is used in the unequal step length grid for the discretization of the TSDH equation into a set of finite difference equations. A rarefied grid was arranged in the calculation space, then a dense grid was arranged near the wing and alternate iteration of the rarefied and dense meshes was carried out so as to accelerate convergence and raise calculation precision. Calculations of the supercritical without shock wave and with shock wave conditions of the ONERA M6 wing show that there is good agreement between the TSDH solution and the FVP solution and wind tunnel tests. **A NUMERICAL SOLUTION OF THE SHOCK-TURBULENT INTERACTION OVER A COMPRESSION CORNER FOR SUPERSONIC FLOW**

C. QIPENG (Nanjing Aeronautical Inst.) *In its* Acta Aeron. et Astronautica Sinica (FTD-ID(RS)T-1120-84) p 18-33 4 Oct. 1985 refs Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 4, 1983 p 11-19
Avail: NTIS HC A04/MF A01 CSCL 01A

The shock turbulent boundary layer interaction over a compression corner for supersonic flow is calculated. The calculations use the Cebeci-Kellet box method; the turbulence model uses the algebraic eddy viscosity model; the pressure strength distribution uses the unified hypersonic and supersonic formulas of flowing over a wedge. Iteration correction is carried out of the shock turbulent boundary layer disturbance. The calculations predict the wall pressure distribution as well as the initial rise point location of the pressure. Author

**NUMERICAL SOLUTION OF HYPERSONIC FLOW NEAR LEADING EDGE OF A FLAT PLATE**

D. FU *In its* Three Articles on New Calculation Methods in Aeron. (Selected Articles) (FTD-ID(RS)T-0910-84) p 1-14 17 Aug. 1984 refs Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 3, Sep. 1983 p 1-8 Original language document announced in IAA as A84-23903
Avail: NTIS HC A04/MF A01 CSCL 01B

A one-step difference scheme for solving two-dimensional steady state Navier-Stokes equations is proposed to handle supersonic and hypersonic viscous interaction problems near the leading edge of a flat plate. The scheme is considered and analyzed with a model equation. It has second-order accuracy in space for steady state problems and its stability condition is improved. The scheme is much simpler, compared to the commonly used two-step predictor-corrector difference scheme for N-S equations and also is convenient for programming. Two viscous interaction problems are solved with the proposed scheme; the solutions are valid throughout the boundary layer, shock-wave structure, and inviscid core. The results show good agreement with experimental data. The numerical solutions show that the nonslip conditions can be used for weak viscous interaction. C.D. (IAA)

**A NEW METHOD FOR CALCULATING UNSTEADY SUPERSONIC AERODYNAMIC FORCES AND ITS APPLICATION**

X. WANG *In its* Three Articles on New Calculation Methods in Aeron. (Selected Articles) (FTD-ID(RS)T-0910-84) p 15-31 17 Aug. 1984 refs Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 3, Sep. 1983 p 9-18
Avail: NTIS HC A04/MF A01 CSCL 01B

This paper proposes a new method for calculating supersonic unsteady aerodynamic forces. It combines the piston theory for unsteady supersonic flow with the conical flow theory for steady flow so that the interaction between points on a wing neglected in the piston theory is approximated by the conical flow theory. This method was used in this paper for flutter calculations of 29 cases for wings with 10 different types of plane forms. The results were compared with flutter test results obtained in wind tunnels and they were in satisfactory agreement. It was especially the case that the accuracy of flutter analysis improved by this method was noticeably higher than that obtained by the piston theory. This shows that this method is reliable and feasible for supersonic flutter analysis. It possesses the advantages of being a more succinct method and having higher calculation accuracy, less computing time and easier programming. Author

**EFFECT OF A SHEAR LAYER ON THE STABILITY OF AN AXISYMMETRICAL EXTERNAL COMPRESSION AIR INTAKE**

K. ZHANG, S. YU, and C. PENG *In its* Three Articles on New Calculation Methods in Aeron. (Selected Articles) (FTD-ID(RS)T-0910-84) p 32-42 17 Aug. 1984 refs Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 3, Sep. 1983 p 56-62
Avail: NTIS HC A04/MF A01 CSCL 01B

The influence of shear layers of various strengths on the stability of an axisymmetric compression supersonic air intake is studied. Strength is defined as the ratio of total pressure difference between the two sides of a shear layer to the total pressure of the incoming flow. Six central bodies with different cone angles were used to produce shear layers with strengths ranging from 5 to 11 percent of the total pressure of upstream flow inside a free stream wind tunnel with a fixed Mach number of 1.72. Shear layers with less than 10 percent strength were strong enough to cause separation of the boundary layer from the inside surface of the cowl. Shear layers of strength less than 11 percent failed to induce buzz in the axisymmetric intake. The influence of a shear layer depended on its distance from the lip of the cowl, and was most noticeable at a distance of 10 to 18 percent of the cowl radius. C.D. (IAA)

**COMMENT ON DETERMINATION OF AERODYNAMIC COEFFICIENTS FOR A REENTRY BODY BY MEANS OF THE KALMAN FILTER METHOD**

J. CAI *In its* Three Articles on New Calculation Methods in Aeron. (Selected Articles) (FTD-ID(RS)T-0910-84) p 43-46 17 Aug. 1984 Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 3, Sep. 1983 p 102-104
Avail: NTIS HC A04/MF A01 CSCL 01B

Research emphatically indicates that a mathematical model for aerodynamic parameter identification of a reentry body bases only on the data of angular rates and accelerations onboard but not on trajectory observation data. It can only determine the ratio between aerodynamic coefficients of the reentry body but can't determine the aerodynamic coefficients directly. B.W.

**A STUDY OF THE AERODYNAMIC PERFORMANCE OF WEIS-FOGH WINGS Ph.D. Thesis**

H. H. CHEN 1985 145 p

Avail: Univ. Microfilms Order No. DA8510956

A general theory of aerodynamics developed on the basis of viscous flow equations, is utilized in an investigation of the Weis-Fogh problem. The general theory is ideally suited for nonlinear unsteady aerodynamic problems. It is also shown that the general theory permits the important flow elements dominating the aerodynamics of nonlinear unsteady flows to be identified and their contributions evaluated individually. The Weis-Fogh problem is a well known biofluiddynamics problem involving articulate lifting bodies. The present study has yielded useful results for the lift and drag acting on a wing undergoing the fling and the clap phases of the Weis-Fogh motion. Closed form expressions have been obtained for the unsteady aerodynamic forces and the power expenditure of the Weis-Fogh wing. These results have led to the identification of major contributions to aerodynamic performance of the Weis-Fogh wings and to an assessment of the relative importance of these contributions. Dissert. Abstr.

**ON THE DESIGN OF AIRFOILS IN TRANSONIC FLOW USING THE EULER EQUATIONS Ph.D. Thesis**

J. F. FAY 1985 83 p

Avail: Univ. Microfilms Order No. DA8509636

This work falls naturally into two parts. One part describes a computer program that designs airfoils using the Lighthill method of conformal mappings. This program involves the use of the Euler equations to solve for the flow past a given initial shape, and also around intermediate shapes. The other part is a derivation of an extension of the Lighthill method to compressible flows with the assumptions of potential flow and small disturbances of the free stream. The description of the program speaks to its various aspects, namely the Euler solution formulation and the actual process of design. Several other topics are also mentioned; these include several factors affecting the rate of convergence of the design process, the importance of equaling the lift coefficients of the initial and final shapes; and the effect of using the same design velocity distribution at different freestream Mach numbers. There is a short appendix giving a plausible argument indicating that the interaction for small disturbance and arbitrary subsonic Mach number will converge to a desired shape. Dissert. Abstr.

(NASA-CR-176237; NAS 1.26:176237; IPR-2) Avail: NTIS HC A04/MF A01 CSCL 01A

The clarification of the role of freestream turbulence scale in determining the location of boundary layer separation is discussed. Modifications to the test facility were completed. Wind tunnel flow characteristics, including turbulence parameters, were determined with two turbulence generating grids, as well as no grid. These results are summarized. Initial results on the role of scale on turbulent boundary layer separation on the upper surface of an airfoil model are also discussed. Author

**EVALUATION OF AN AERODYNAMIC-LOAD PREDICTION METHOD ON A STOL FIGHTER CONFIGURATION**

J. KATZ Aug. 1985 33 p refs Previously announced as N85-33121

(NASA-TM-86782; REPT-85358; NAS 1.15:86782) Avail: NTIS HC A03/MF A01 CSCL 01A

A three-dimensional panel method was used to compute the aerodynamic loads on a large-scale, powered wind tunnel model. The size of the computation grid was selected such that turnaround times, on present computers remained satisfactory. With this constraint, the STOL aircraft configuration was modeled and the capabilities and limitations of the prediction method were investigated. After this study, a similar numerical model was established for a forward-swept-wing aircraft configuration which is planned for large-scale, low-speed testing. The resulting aerodynamic-load predictions are discussed and will be utilized, together with the future experimental results, to obtain a broader validation of this method as well as to reduce the necessary size of the matrix of the test parameters. **THREE-DIMENSIONAL INVISCID ANALYSIS OF RADIAL TURBINE FLOW AND A LIMITED COMPARISON WITH EXPERIMENTAL DATA**

Y. K. CHOO and K. C. CIVINSKAS (Army Aviation Research and Technology Activity) 1985 28 p refs To be presented at the ASME Winter Ann. Meeting, 3-Dimensional Flow Phenomena in Fluid Machinery Symp., Miami, Fla., 17-22 Nov. 1985

(NASA-TM-87091; E-2679; NAS 1.15:87091; USAAVSCOM-TR-85-C-12) Avail: NTIS HC A03/MF A01 CSCL 01A

The three-dimensional inviscid DENTON code is used to analyze flow through a radial-inflow turbine rotor. Experimental data from the rotor are compared with analytical results obtained by using the code. The experimental data available for comparison are the radial distributions of circumferentially averaged values of absolute flow angle and total pressure downstream of the rotor exit. The computed rotor-exit flow angles are generally underturned relative to the experimental values, which reflect the boundary-layer separation at the trailing edge and the development of wakes downstream of the rotor. The experimental rotor is designed for a higher-than-optimum work factor of 1.126 resulting in a nonoptimum positive incidence and causing a region of rapid flow adjustment and large velocity gradients. For this experimental rotor, the computed radial distribution of rotor-exit to turbine-inlet total pressure ratios are underpredicted due to the errors in the finite-difference approximations in the regions of rapid flow adjustment, and due to using the relatively coarser grids in the middle of the blade region where the flow passage is highly

three-dimensional. Additional results obtained from the three-dimensional inviscid computation are also presented, but without comparison due to the lack of experimental data. These include quasi-secondary velocity vectors on cross-channel surfaces, velocity components on the meridional and blade-to-blade surfaces, and blade surface loading diagrams. Computed results show the evolution of a passage vortex and large streamline deviations from the computational streamwise grid lines. Experience gained from applying the code to a radial turbine geometry is also discussed.

**NUMERICAL PROCEDURE FOR THREE-DIMENSIONAL HYPERSONIC VISCOUS FLOW OVER AEROBRAKE CONFIGURATION**
C. P. LI Aug. 1985 17 p refs
(NASA-TM-58269; S-549; NAS 1.15:58269) Avail: NTIS HC A02/MF A01 CSCL 01A

A numerical method, which is simpler and more efficient than others currently in use, is proposed for the computation of the full viscous flow over an aerobrake body in hypersonic stream at high altitude. It treats the shock layer surrounding the blunt forebody and the near wake behind the base simultaneously by formulating the Navier-Stokes equations in conformal and azimuthal-angle coordinates. The computational domain is confined by the body wall, outflow surface and the shock, which is adjusted along the coordinate normal to the wall in the course of iterations. Because of the optimal grid and a well developed alternating direction implicit factorization technique for the governing equations, reasonably accurate results can be obtained with a 28 x 36 x 7 grid and 400 time-marching iterations. Excellent agreement of shock location is found between the present result and the schlieren photograph. Details of the base flow and shear layer impingement on the cylindrical aft body are presented for an adiabatic wall case.

**FORCED RESPONSE ANALYSIS OF AN AERODYNAMICALLY DETUNED SUPERSONIC TURBOMACHINE ROTOR**
D. HOYNIAK and S. FLEETER (Purdue Univ., West Lafayette, Ind.) 1985 24 p refs Presented at 10th Bien. Design Eng. Div. Conf. and Exhibit on Mech. Vibration and Noise, Cincinnati, 10-13 Sep. 1985; sponsored by ASME
(NASA-TM-87093; E-2685; NAS 1.15:87093) Avail: NTIS HC A02/MF A01 CSCL 01A

High performance aircraft-engine fan and compressor blades are vulnerable to aerodynamically forced vibrations generated by inlet flow distortions due to wakes from upstream blade and vane rows, atmospheric gusts, and maldistributions in inlet ducts. In this report, an analysis is developed to predict the flow-induced forced response of an aerodynamically detuned rotor operating in a supersonic flow with a subsonic axial component. The aerodynamic detuning is achieved by alternating the circumferential spacing of adjacent rotor blades. The total unsteady aerodynamic loading acting on the blading, as a result of the convection of the transverse gust past the airfoil cascade and the resulting motion of the cascade, is developed in terms of influence coefficients. This analysis is used to investigate the effect of aerodynamic detuning on the forced response of a 12-blade rotor, with Verdon's Cascade B flow geometry as a uniformly spaced baseline configuration. The results of this study indicate that, for forward traveling wave gust excitations, aerodynamic detuning is very beneficial, resulting in significantly decreased maximum-amplitude blade responses for many interblade phase angles. The split-coefficient matrix (SCM) form of the Euler equations for a cylindrical base coordinate system is extended to allow the use of a generalized three-dimensional grid generation scheme. A grid generation scheme based on a parabolic partial differential equation is developed. Grids are obtained without iteration by marching from the body to the shock with body and shock points specified. The SCM type body boundary condition has been found to underpredict surface pressure for geometries with small radii of curvature. An improved method of characteristic (MOC) type body boundary condition has been developed which uses SMC type differencing in the crossflow direction. The improved MOC boundary condition has been found to have the robustness of the SCM type scheme while having superior accuracy. Solutions using the SCM form of the Euler equations with the parabolic grid generator and the improved MOC body boundary condition have been obtained for a hypersonic six fin missile. Generally good agreement is found in comparisons of the inviscid predictions with experimental data. DOE

A method to compute two dimensional noncompressible viscous flow on multiprofile configurations is described. The potential flow and the viscous layers are solved interactively. The potential flow is obtained by a singularities method. The boundary layers are

treated by integral equations. Evaluation using the ATR 42 configuration (narrow slots, separated flow) shows the robustness of the method when treating difficult problems and a good prediction of separation and pressure distribution. The computer program is adapted to industrial utilization on CRAY 1 computer.

**INVESTIGATIONS ON A SUPERCRITICAL AIRFOIL WITH BOUNDARY LAYER SUCTION THROUGH A PERFORATED STRIP IN THE SHOCK REGION**
P. KROGMANN Nov. 1984 56 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-940)
(DFVLR-FB-85-15; ISSN-0171-1342) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 16.50

The effect of local boundary layer suction through a perforated strip on the flow development and aerodynamic characteristics of a transonic airfoil is investigated in a 1 m X 1 m transonic wind tunnel. In comparison with reference measurements on the same model with a solid surface, the results show that, aside from the improvements due to suction, the flow development in the non-suction case is most favorably affected by the arrangement of the perforated strip with a cavity underneath. Due to a secondary flow through the perforation and cavity, caused by the strong adverse pressure gradients occurring at higher angles of attack, the shock location as well as the flow field downstream of the shock are affected. Thus, considerable gain in maximum lift and drag reductions can be achieved.

(DFVLR-FB-85-17; ISSN-0171-1342) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 21.50

For two rectangular wings with flaps (Q/R4 and NACA 4415) pressure distribution for plane flow and low flow velocities is measured. For ground simulation fixed ground boards adjustable in height are used. Reynolds and Mach numbers are 1.6 million and 0.15. For the NACA 4415 wing flow field measurements are carried out also. The surface singularity method with separation model used for the calculations is outlined. Agreement between experiment and theory is good to satisfactory, especially if flow separation is not too large. But even for large separated flow regions the separation model improves results. The presence of ground gives enlarged flow separation, higher pressure and base pressure values, and lower suction peaks. High-lift systems with positive camber line show considerable losses of lift near ground. A static instability of lift with respect to ground distance occurs. This effect becomes stronger as the angle of attack is increased.

**INLET FLOW DYNAMIC DISTORTION PREDICTION WITHOUT RMS MEASUREMENTS Ph.D. Thesis**
Y. S. CHEN 1984 118 p
Avail: Univ. Microfilms Order No. DA8513816

A two-equation turbulence model, k-epsilon model, is used in the prediction of inlet flow dynamic distortion of jet aircraft based on steady state total pressure measurements only. This Turbulence model is solved at the compressor face station by using a finite difference scheme. Total pressure rms level of the inlet flow is predicted by the turbulence model. The Melick statistical method is then employed to estimate the peak dynamic distortion based on the analytically predicted total pressure rms level. A statistical method is developed for the estimation of boundary conditions for the turbulent equations. In order to solve the set of nonlinear, coupled turbulent equations, an implicit formulation is utilized such that a set of discretized finite difference equations can be arranged into tridiagonal matrix equations for efficient numerical iterations. Results of the prediction compare well with experimental measurements of subsonic, transonic and supersonic inlets under various flight conditions. The present method can be used in the preliminary inlet design phases to reduce the design costs.

**EFFECT OF AILERON DEFLECTIONS ON THE AERODYNAMIC CHARACTERISTICS OF A SEMISPAN MODEL OF A SUBSONIC ENERGY-EFFICIENT TRANSPORT**
P. F. JACOBS Oct. 1985 344 p refs
(NASA-TP-2478; L-15934; NAS 1.60:2478) Avail: NTIS HC A15/MF A01 CSCL 01A

An investigation was conducted in the Langley 8 Foot Transonic Pressure Tunnel to determine the effect of aileron deflections on the aerodynamic characteristics of a subsonic energy efficient transport (EET) model. The semispan model had an aspect ratio 10 supercritical wing and was configured with a conventionally located set of ailerons (i.e., a high speed aileron located inboard and a low speed aileron located outboard). Data for the model were taken over a Mach number range from 0.30 to 0.90 and an angle of attack range from approximately -2 deg to 10 deg. The Reynolds number was 2.5 million per foot for Mach number = 0.30 and 4 million per foot for the other Mach numbers. Model force and moment data, aileron effectiveness parameters, aileron hinge moment data, otherwise pressure distributions, and spanwise load data are presented.

(COLL-AERONAUTICS-8510) Avail: NTIS HC A06/MF A01

The effect of the ground on a rotor wake in forward flight was investigated experimentally in the working section of an 8 ft x 4 ft straight through wind tunnel. A three bladed fully articulated rotor with a solidity ratio of 0.07 and diameter of 1.06 m, powered by a hydraulilc motor, was tested at a height of 0.47 rotor diameter above a solid ground board which has a elliptical leading edge. Tests were run at various low advance ratios (less than 0.1) with two collective pitch settings. A hot wire anemometer probe was used to measure the average value of the three components of velocity. The rotor wake and the ground vortices were visualized by smoke. Both experimental results and theoretical estimates show that the ground induced interference is an upwash and a decrease in forward velocity.

A shock fitting method applied to the transonic small disturbance (TSD) potential equation is described. This method is then applied to a simple, two dimensional (2-D) rotating disturbance which is analogous to a shock radiating from the tip of a rotor blade in high speed hover. A comparison is made between the results of this method and the more standard shock capturing method. This comparison makes it clear that the effect of the results on the acoustic signature of the 2-D model is significant, and similar results can be expected when the method is extended to the three dimensional (3-D) case. This informational handbook has been prepared in response to a requirement levied by the SAC Instrument Flight Course (SIFC), Castle AFB, California. The Microwave Landing System (MLS) is projected for worldwide installation and use by both civilian and military facilities. This handbook has been developed for use in conjunction with an individualized lesson plan, prepared by the SIFC faculty. The history, development, advantages, and future projections for this excellent system are explained. The handbook is not a text for engineers, but for the pilot who is interested in safety of flight, noise abatement, and increased system confidence. The author's intent in authoring this project was to provide a brief introduction to the reasons behind the transition from Instrument Landing System (ILS) to the Microwave Landing System (MLS), and the international scope of this endeavor. Through the comparison of the operational and maintenance advantages of these two systems the author hopes to capture the interest of pilots by making them aware of the tremendous technological gains embodied in the Microwave Landing System. **A STUDY INTO THE OPERABILITY OF RPVS IN ADVERSE WEATHER**
L. V. PARKINGTON (Royal Armament Research and Development Establishment, Fort Halstead, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 1.1-1.4.

The effect of cloud base height on the operability of an RPV is examined, taking into account the requirement for a direct line of sight (LOS) between the vehicle in the air and the ground data terminal (GDT). Cloud base height measurements carried out in Germany at quarterly intervals were curve fitted by a spline interpolation to calculate the probability of a direct LOS between the vehicle and the GDT, and RPV operability is calculated as a function of range. The mean operability was in the range 0.75-0.95, and the worst case operability at a distance of 70 kms was 0.6. The seasonal variation in operability was within 0.2 for typical operating conditions. It is concluded that the mean operability of about 0.8 should not reduce the effectiveness of RPV systems for most day/night surveillance and target acquisition applications. I.H.

**THE VEGA PORTABLE RADAR TRACKING CONTROL SYSTEM**
R. F. IRBY (Vega Precision Laboratories, Vienna, VA) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 22.1-22.8.

Some past applications of the model 657 portable radar tracking control system are described, and some recent design improvements are noted. The model 657 portable radar tracking system consists of only three major components including the antenna; radar set control; and target position display unit. Some of the design improvements incorporated into the latest version of the portable radar tracking system, model 6157, include: an increased operational range from 50 to 100 nautical miles; enhanced interference rejection by means of pulse amplitude discrimination and pulse position coding; and more data downlink channels. The new 6157 system is recommended as a tracking radar for RPV applications. Black and white photographs of the model 657 and the model 6157 radars are provided. I.H.

### DOPPLER NAVIGATION AND THE RPV

K. HOLFORD (Philips Research Laboratories, Redhill, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 24.1-24.6. Research supported by the Ministry of Defence (Procurement Executive).

The size, weight and cost of a Doppler navigator suitable for use in a RPV is dependent on the system used and the performance required. A height ceiling of a few thousand feet is substantially less than that of a normal commercial navigator and allows a simplification of the design. The unmodulated carrier type of Doppler navigator design is not, however, the most appropriate for the requirement. This paper looks at navigator construction and describes a suitable one for the RPV application. Author

### DATA LINK COMMUNICATIONS IN TACTICAL AIR COMMAND AND CONTROL SYSTEMS

C. L. GOLLIDAY, JR. (Institute for Defense Analysis, Alexandria, VA) IEEE Journal on Selected Areas in Communications (ISSN 0733-8716), vol. SAC-3, Sept. 1985, p. 779-791. DOD-sponsored research. refs

Data links in tactical air command and control systems (ACCSs) connect the computers of command and control units to one another and to weapon systems to enable rapid exchanges of real-time tactical information. This paper presents an overview description of the current and future ACCS data link architecture used by the Services and NATO. This architecture currently consists of various tactical digital information link (TADIL) standards and NATO link standards. In the near future, the Joint Tactical Information Distribution System (JTIDS) will be a major component of the architecture. While the architecture of the far future is speculative, a description of some concepts being considered, such as the role of the International Standards Organization (ISO) reference model, is presented. ### METHODOLOGY OF THE FLIGHT TESTING OF THE FLIGHT-CONTROL AND NAVIGATION EQUIPMENT OF AIRCRAFT AND HELICOPTERS [METODOLOGIIA LETNYKH ISPYTANI I PILOTAZHNO-NAVIGATSIONNOGO OBORUDOVANIIA SAMOLETOV I VERTOLETOV]

D.-E. P. NOVODVORSKII, G. I. POIARKOV, E. G. KHARIN, O. V. VINOGRADOV, and P. I. VLASOV Moscow, Izdatel'stvo Mashinostroenie, 1984, 136 p. In Russian. refs

The general design of the flight-control and navigation complexes of aircraft and helicopters is discussed, and the principal components of these systems are examined. Attention is then given to the structure and methods of the flight testing of flight-control and navigation systems as well as methods for the processing and analysis of flight test data. The discussion also covers the computer simulation of flight-control and navigation complexes and methods for evaluating their precision. V.L.

### TACTICAL JAMMING

A. D. ROBERTSON and F. C. PAINTER (Watkins-Johnson Co., San Jose, CA) Defense Science and Electronics (ISSN 0744-6241), vol. 4, Sept. 1985, p. 20-22, 24, 26, 28.

It is pointed out that various technological factors have combined to increase the ability of modern systems to effectively jam multiple transitory targets without seriously degrading friendly communications. Possibilities for improving jam-resistance are, therefore, considered. In this context, it is important to review the state of development of short-range VHF/UHF tactical communications systems, and the jamming devices which have been developed to defeat them. Attention is given to three electrical system design approaches commonly used to improve the antijam capabilities of communication systems, the types of jammers, time-share jamming, jamming slower systems, time-gated repeaters, and future developments. G.R.

### TRAFFIC ALERT AND COLLISION AVOIDANCE SYSTEM SIGNAL ENVIRONMENT MODEL (TCAS SEM) PROGRAMMER'S REFERENCE MANUAL Final Report, Aug. 1984 - Feb. 1985

C. GILCHRIST, E. WOODS, and T. KEECH Jul. 1985 169 p refs Prepared for Dept. of Defense, Annapolis
(Contract F19628-80-C-0042)
(FAA-PM-85-22; ECAC-CR-85-031) Avail: NTIS HC A08/MF A01

A traffic alert and collision avoidance system signal environment model (TCAS SEM) was developed to predict the time-average TCAS I and minimum TCAS II signal rates in a user-selected air traffic deployment. The TCAS SEM is described which includes: the modeled systems, the data-storage and retrieval subsystems for engineering data, and the software structures of all component subsystems. E.A.K.

### THE OPERATIONAL 'EYRIE' MULTI-ROLE ADVANCED MINI-RPV SYSTEM

M. REED (National Dynamics /Pty/, Ltd., Pinetown, Republic of South Africa) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 5.1-5.6.

The design characteristics of the Eyrie multirole returnable RPV are described. Consideration is given to the control and guidance equipment which permit the Eyrie to maintain a round-the-clock all-weather capability for real-time surveillance; electronic countermeasures; and rocket strikes against a variety of targets. The powerplant of the Eyrie consists of one 52 hp two-cylinder two-stroke engine with integral cooling. The ground control and associated tracking equipment for the Eyrie are described including the video link to ground; the command data processing hardware; and payload and weapons management systems. A series of photographs of the vehicle is provided. I.H.

**A86-10355**

### EXPERIMENTAL RPV - AN INDIAN EXPERIENCE

R. KRISHNAN, V. MITTAL, and V. DESIKAN (Aeronautical Development Establishment, Bangalore, India) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 7.1-7.11.

The design features of an Indian RPV system for civilian applications are discussed. The vehicle was built for takeoff from short runways, glider strips, or highways carrying a 10-16 lb payload. The vehicle has a high wing twin boom and pusher propeller configuration with a wing span of 3.8 m and a chord of 0.6 m. The airfoil section for the wings corresponded to a NACA 2412 profile. The powerplant for the RPV was a commercially available two cylinder piston engine of 18 hp. Control and data telemetry for the RPV was provided by a UHF FM/FDM/FM system (uplink) and a VHF/FM/FM system (downlink), with all essential flight data transmitted through the downlink. The vehicle stabilization system consisted of a vertical gyro, a heading sensor, a height hold transducer; and an air data transducer. A series of flight tests of the RPV system is described, and photographs of the vehicle in flight are provided. I.H.

**A86-10358**

### THE AUTOGYRO AS A R.P.V

W. M. FRASER (W. Vinten, Ltd., Bury Saint Edmunds, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 10.1-10.8.

The design of a remotely piloted autogyro is described. The basic airframe structure consists of a keel and rotor pylon manufactured from light alloy tubing and supported by T section light alloy extrusions. The powerplant of the autogyro is a modified four cylinder air cooled two stroke engine of 70 hp, driving a fixed two blade pusher propeller and a pre-takeoff spin up drive. The autogyro control system consisted of two servo actuators powered by 12V/5 amp batteries, and a two-axis hand controller. A push button was mounted on top of the control column for quick conversion to manual control. The system was tested during the course of one flight, and some improvements in the design of the servo actuators are recommended on the basis of the flight test results. A black and white photograph of the instrumentation panel is presented. I.H.

**A86-10365**

### DESIGN STANDARDS FOR UNMANNED AIRVEHICLES (UMAV)

P. H. MORGAN (Theta Analysis and Systems, Ltd., Camberley, England) IN: Remotely piloted venicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 18.1-18.7.

The need for a systematic approach to the design manufacture of unmanned airvehicles (UMAV) in the UK is discussed. Consideration is given to the operational requirements of UMAVs with respect to performance, operating environment, mission role. It is shown that current design requirements of the UK military for UMAVs do not require effective standardization of designs through the use of interchangeable parts, interfaces, and common power capacities. It is recommended that government authorities promulgating UMAV design requirements publish a single stand-alone version of the requirements in order to avoid ambiguity. I.H.

**A86-10374**

### CONDOR - A CANADIAN RPA FOR COMMERCIAL APPLICATIONS

G. F. TOMLINS (British Columbia Research, Vancouver, Canada) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Supplementary Papers . Bristol, University of Bristol, 1984, p. 6.1-6.7. Research supported by the Ministry of Universities, Science and Communications of the Province of British Columbia. refs

The use of remotely piloted aircraft (RPA) for environmental remote sensing is discussed. A fixed-wing model aircraft carrying a 35 mm camera was tested to gain operating experience, evaluate the usefulness of model aircraft for remote sensing, and to determine the limitations of model aircraft. Based on this experiment, general system requirements for a RPA were established; an explanation of these requirements is provided. The B.C. Research RPA program built a new RPA system, the low-cost Condor, based on a conventional puller design. The Condor system is powered by a 6.5 hp single cylinder gasoline engine that drives a 56 cm fixed pitch propeller and is easily dismantled for transportation. The control system, navigation system, sensors, and safety features of the Condor are explained. The Condor system was flight-tested and proved useful for environmental remote sensing as well as for military applications. I.F.

### IS THE 680 ROTOR BELL'S LHX CANDIDATE?

M. LAMBERT Interavia (ISSN 0020-5168), vol. 40, Sept. 1985, p. 981, 982.

Features of the prototype 680 all-composite rotor are outlined, together with tested flight qualities which make the 680 a major candidate for the U.S. Army LHX program. The 680 halves the usual number of rotor parts, eliminates heavily loaded bearings, and offers an extremely vibration-free ride, the latter a LHX requirement. Rotor life is estimated at 10,000 hr, the lifetime of a present generation helicopter. A test vehicle equipped with the 680 rotor has performed 200 km/hr dives, pulled 2.8 g, and flown half-rolls and pull-throughs. M.S.K.

### TURBOPROP AIRLINERS GET BIGGER - WILL THEY HAVE A MARKET?

B. REK Interavia (ISSN 0020-5168), vol. 40, Sept. 1985, p. 995-998.

New turboprop aircraft seating over 40 passengers are being built by European manufacturers to satisfy the demands of feeder, regional and commuter traffic. The new aircraft include the ATR42-200 44-seater, the F26 50-seater, the ATP 64-seater and the Dash 8 Series 300 50-seater. Variants of all the aircraft are also being planned, some in stretch versions and some with pressurized cabins. Much of the manufacturing activity is spurred by the growth of U.S. regional markets since deregulation. The size of the stretch turboprop aircraft is inherently limited by the overlap with small jet aircraft and their speed advantages. M.S.K.

**A86-10926#**

### LARGE AIRPLANE DERIVATIVE DEVELOPMENT METHODOLOGY

D. L. ROBINSON and M. F. MELARY (Boeing Co., Seattle, WA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 14 p.
(AIAA PAPER 85-3043)

The methodology and technologies applied to design derivatives of large commercial aircraft are described. Redesigns are achieved after a five-stage process consisting of requirements definition, preliminary design, detail design and analysis, testing and qualification and product development/design refinement. All factors involved in initiating and accomplishing a new design are performed with an eye to safety as a fundamental design criteria. Decisions can then proceed on the basis of the needs of the market up to 4 yr in advance. The designs must also minimize the airlines' acquisition and operating costs while incorporating state of the art technologies and configuration flexibility. CAD has emerged as a central tool to the development and assessment process. The 747-300 design process is outlined as a case study to illustrate the procedures described. M.S.K.

**A86-10932#**

### A RAPID EVALUATION APPROACH FOR CONFIGURATION DEVELOPMENT OF NEW AIRCRAFT

Y. T. PHOA, F. CAMPISANO, P.-C. CHEN, and G. WAKAYAMA (Northrop Corp., Aircraft Div., Hawthorne, CA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-3068)

Procedures followed in a computerized rapid evaluation (REV) approach to in-depth evaluations of new aircraft configurations at the early conceptual design stage are outlined. REV permits the incorporation of state of the art technology, design trade-off studies and structural design practices which lead to an optimal planform before metal cutting begins. Details of aerodynamic and structural optimization of a wing are reviewed, including the optimization codes employed in the REV CAD studies. Future extensions of the REV process to aeroelastic tailoring of entire aircraft are discussed from the point of view of the required algorithms, particularly in applications with forward swept wing aircraft. M.S.K.

**A86-10935#**

**APPROACH AND LANDING THRUST REVERSER TESTING IN GROUND EFFECT**

P. B. JOSHI (Northrop Corp., Aircraft Div., Hawthorne, CA) and M. K. COMPTON (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 17 p. refs

(Contract F33615-81-C-3025)

(AIAA PAPER 85-3075)

Wind tunnel test results with a thrust reversing twin engine/twin tail scale model similar to a modified F-18 in ground proximity are reported. The trials were performed to expand the database on the thrust reversing twin engine configuration in free air. Tests were run at free air, 0.36 wing span above ground, and landing gear height. The effects of angle-of-attack, sideslip, horizontal tail deflection, rudder deflection, wing trailing edge flap angle, and landing gear were examined. Reverser-induced effects were assessed in terms of the jet/freestream dynamic pressure ratio. Data were also collected on the effects of various jet operational and placement parameters. The results are discussed with regard to aerodynamic effects, particularly at close-to-ground proximity. M.S.K.

**A86-10951#**

**DEVELOPMENT STATUS OF THE RSRA/X-WING**

R. G. GUERTIN (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 7 p.

(AIAA PAPER 85-4008)

The four stages of development for the RSRA (Rotor System Research Aircraft)/X-Wing are discussed. A description of the RSRA/X-Wing is provided. The Propulsion System Test Bed (PSTB), which conducts the evaluation and qualification of the drive train and the pneumatic and the rotor components of the X-Wing system, is explained. The functions and testing of the components of the drive train, pneumodynamic, and rotor systems are described. The Vehicle Management System Laboratory (VMSL) which is used to validate the flight control computer software is discussed. The data to be provided by the wind tunnel model are described. The information from PSTB, VMSL, and wind tunnel testing will be incorporated into a ground-based data system. The aircraft is currently being prepared for the final stage of development, flight testing. I.F.

**A86-10953#**

**ENHANCING AIRCRAFT ROUGH AIRFIELD CAPABILITIES**

G. E. WALROND (USAF, Engineering and Services Center, Tyndall AFB, FL) and M. W. SKINNER (BDM Corp., McLean, VA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. refs

(AIAA PAPER 85-4018)

USAF research indicates a critical lack of capability for combat and airlift aircraft to operate on rough airfields. Civil engineers will be able to complete repairs and reactivate airfields more rapidly if aircraft rough airfield tolerances are increased. Research shows that coordinating the actions of aircraft undercarriage systems with aerodynamic and propulsion controls can enhance rough surface capability without sacrificing airborne performance. This paper describes the airbase wartime operational environment and a systems approach for designing new aircraft to operate in such an environment. The article is directed toward airbase planners and aircraft designers to increase information transfer regarding problems associated with bomb-damaged airfield operations. Author

**A86-10954#**

**IN-SERVICE LANDING GEAR ACTUATION SYSTEM PROBLEMS - THE SOLUTION**

W. C. COOK (Lockheed-Georgia Co., Marietta) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 6 p.

(AIAA PAPER 85-4019)

This paper describes the redesigned main landing gear actuation mechanism for the C-5B cargo aircraft and the improvements over that of the C-5A. Difficulties with the existing mechanism are corrected by replacing the entire gearbox/torque tube system with a mechanism consisting of only two gearboxes and a push rod/crank linkage. This yields substantial improvements over the original actuation system such as fail-safe synchronization between gearboxes, dual motor emergency extension, elimination of clutches in the primary drive train, and improved reliability. Author

**A86-10956#**

**AN ADHESIVELY SEALED, COMPOSITE SKINNED WING FUEL TANK**

B. J. LOGAN (General Dynamics Corp., Fort Worth, TX) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. refs

(AIAA PAPER 85-4023)

The development and evaluation of an adhesively sealed wing fuel tank to improve fuel containment is discussed. The adhesive sealing requires a different finish for detail parts than the conventional sealing; these various finishes are described. The benefits of using the adhesive sealing are discussed. The forward wing box design and the assembly of the wing box, which includes the attachment of the understructure assembly and upper and lower skins, are explained. The completed wing fuel tank was fuel leak tested, with cyclic pressure loading and exposure to temperature extremes, to validate the performance of the sealing. The proof test, preconditioning, test block, holding fixture, and method of leak detection are described. The test results are provided; the results revealed that the sealant provided good overall fuel containment. I.F.

**A COMPUTER-ASSISTED PROCESS FOR SUPERSONIC AIRCRAFT CONCEPTUAL DESIGN**

V. S. JOHNSON (NASA, Langley Research Center, Hampton, VA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. refs

(AIAA PAPER 85-4027)

Design methodology was developed and existing major computer codes were selected to carry out the conceptual design of supersonic aircraft. A computer-assisted design process resulted from linking the codes together in a logical manner to implement the design methodology. The process does not perform the conceptual design of a supersonic aircraft but it does provide the designer with increased flexibility, especially in geometry generation and manipulation. Use of the computer-assisted process for the conceptual design of an advanced technology Mach 3.5 interceptor showed the principal benefit of the process to be the ability to use a computerized geometry generator and then directly convert the geometry between formats used in the geometry code and the aerodynamics codes. Results from the interceptor study showed that a Mach 3.5 standoff interceptor with a 1000 nautical-mile mission radius and a payload of eight Phoenix missiles appears to be feasible with the advanced technologies considered. A sensitivity study showed that technologies affecting the empty weight and propulsion system would be critical in the final configuration characteristics with aerodynamics having a lesser effect for small perturbations around the baseline. Author

**A86-10960#**
**RAPID SIZING METHODS FOR AIRPLANES**
J. ROSKAM (Kansas, University, Lawrence) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 8 p.
(AIAA PAPER 85-4031)

A rapid method for preliminary weight sizing of aircraft which uses a series of logarithmic correlations between takeoff weight and empty weight is presented. The method allows rapid calculation of aircraft growth factors due to changes in mission specifications or changes in drag polar, engine specifics, payload, and empty weight. For a given mission specification, a rapid method for estimating takeoff gross weight, empty weight, and mission fuel weight is presented. The method applies to the following 12 types of aircraft: (1) homebuilts; (2) single engine props; (3) twin engine props; (4) agriculturals; (5) business jets; (6) regional turboprops; (7) transport jets; (8) military trainers; (9) fighters; (10) military patrol, bomb, and transport aircraft; (11) flying boats, amphibious, and float aircraft; (12) supersonic cruise aircraft. C.D.

**CONFIGURATION STUDIES FOR FUEL-EFFICIENCY MAXIMISATION**
J. E. CHACKSFIELD (British Aerospace, PLC, Airframe Engineering Dept., Kingston-upon-Thames, England) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 8 p. refs
(AIAA PAPER 85-4032)

The use of Multivariate Optimization (MVO), which investigates numerous design options and varies specific parameters, to evaluate configurational changes is examined. The MVO program can handle up to 25 variables and 50 constraints for any one problem. The basic computer design and the design synthesis program, which interface to form MVO are described. The modelling technique used in MVO is explained. An example utilizing MVO to establish maximum fuel efficiency, considering various parameters, for a 40-seat commuter aircraft is presented. I.F.

**A86-10962*#** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
**GROUND EFFECTS ON V/STOL AND STOL AIRCRAFT - A SURVEY**
J. ESHLEMEN (NASA, Ames Research Center, Moffett Field, CA) and R. E. KUHN AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 25 p. refs
(AIAA PAPER 85-4033)

The flow fields encountered by jet- and fan-powered Vertical/Short Takeoff and Landing (V/STOL) aircraft operating in ground effect are reviewed and their general effects on the aerodynamic characteristics are discussed. The ground effects considered include (1) the suckdown experienced by a single jet configuration in hover, (2) the fountain flow and additional suckdown experienced by multiple jet configurations in hover, (3) the ground vortex generated by jet and jet flap configurations in Short Takeoff and Landing (STOL) operation and the associated aerodynamic and hot-gas-ingestion effects, and (4) the change in the downwash at the tail due to ground proximity. After over 30 years of research on V/STOL aircraft, the general flow phenomena are well known and, in most areas, the effects of ground proximity can be estimated or can be determined experimentally. However, there are some anomalies in the current data base which are discussed. Author

**A86-10963#**
**GROUND EFFECT AND THE HELICOPTER - A SUMMARY**
R. W. PROUTY (Hughes Helicopters, Inc., Culver City, CA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 7 p. refs
(AIAA PAPER 85-4034)

The performance benefits and problems of a helicopter in hover and forward flight due to ground effect are examined. When the helicopter is in the hover or forward flight position the influence of the ground on flow conditions at the rotor allows for reduced power requirements; an explanation of this effect is presented. The measuring of ground effect using models and from actual flight tests is discussed. The influence of the ground effect on the ratio of induced velocities at the rotor disc during hover is graphically represented. Flying close to the ground assists in the balance of the tip vortices of the blades by allowing the induction effects of root vortices. During hover, the ground causes random yaw disturbances and turbulence is felt by observers. The negative ground effect during the transition from hover to forward flight due to increased power is explained. The influence of ground vortex on lateral control and rearward flight is described. Diagrams and graphs of the ground effect are provided. I.F.

**A86-10964#**
**UNSTEADY THRUST REVERSER EFFECTS IN GROUND PROXIMITY**
P. B. JOSHI (Northrop Corp., Aircraft Div., Hawthorne, CA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. refs
(AIAA PAPER 85-4035)

Large and totally unexpected rolling motions observed on a thrust-reversing aircraft model in a wind tunnel operating in ground proximity are described. Time histories of the rolling moment were analyzed to determine the spectral content of the forcing functions which drive the oscillations. The analysis revealed that the forcing function contained significant energies at frequencies to which typical fighter aircraft are sensitive. The magnitude of the forcing function contained was found to be a strong function of the cant or splay angle of the lower reverser jets. Water tunnel tests confirmed that the unsteady behavior resulted from an unsteady interaction between the reverser jets and the free stream. A simplified digital simulation of aircraft motion in ground effect showed that the aircraft experienced both large roll angles and a nose-down attitude at touch-down. C.D.

Research supported by the Texas A&M University and Mooney Aircraft Corp. refs
(Contract NAG1-309)
(AIAA PAPER 85-4038)

Renewed interest in natural laminar flow (NLF) has rekindled designers' concerns that manufacturing deviations, (loss of surface contours or other surface imperfections) may destroy the effectiveness of NLF for an operational airplane. This paper reports on experimental research that compares predicted and measured boundary layer transition total drag, and two-dimensional drag coefficients for three different wing surface conditions on an airplane typical of general aviation manufacturing technology. The three flight test phases included: (1) assessment of an unpainted airframe, (2) flight tests of the same airplane after painstakingly filling and sanding the wings to design contours, and (3) similar measurements after this airplane was painted. In each flight phase, transition locations were monitored using either sublimating chemicals or pigmented oil. As expected, total drag changes were difficult to measure. Two-dimensional drag coefficients were estimated using the Eppler-Somers code and measured with a wake rake in a method very similar to Jones' pitot traverse method. The net change in two-dimensional drag was approximately 20 counts between the unpainted airplane and the 'hand-smoothed' airplane for typical cruise flight conditions. Author

**INTEGRATED FLIGHT DATA PROCESSING SYSTEM - SUPPORT FOR THE DISCIPLINE ENGINEER**
R. M. DAVINO and D. A. FLATTERY (USAF, Flight Test Center, Edwards AFB, CA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. refs
(AIAA PAPER 85-4042)

The development of an Integrated Flight Data Processing System (IFDAPS) for real time acquisition, display, and processing of aircraft flight test data is discussed. The functions of the IFDAPS hardware components, which consist of super minicomputers and telemetry preprocessing modules in a distributed network, are described. An explanation of the interrelated computer programs in the software system, which are run file generator, acquisition display subsystem, the range control subsystem, and the control storage subsystem, is provided. The benefits of improved flight testing procedures are examined. The use of IFDAPS to evaluate aircraft performance, propulsion, stability and control, and flutter is discussed. The means by which IFDAPS architecture supports the operation through the normal preflight, real time, and postflight phases of aircraft flight testing are described. The programming of the data display formats and processing capabilities to meet specific flight testing requirements is explained. The procedures for data acquisition, display, and analysis are examined. I.F.

**A PARAMETRIC EVALUATION OF SUPERSONIC STOVL**
G. H. KIDWELL (NASA, Ames Research Center, Moffett Field, CA) and D. C. RAPP (General Dynamics Corp., Fort Worth, TX) SAE, Aerospace Vehicle Requirements Conference, Washington, DC, May 20-23, 1985. 16 p. refs
(SAE PAPER 851170)

This paper describes the results of a study to evaluate parametric variations to a single engine short-takeoff vertical-landing fighter/attack aircraft design. The variables considered involved thrust vectoring, thrust degradation, maximum lift, and other changes to determine the impact on short-takeoff performance, but subject to a vertical-landing capability. The results indicate that there are certain parameters that have a significant effect on short-field performance. Also, the optimal control strategies for transitions from a short-takeoff to forward flight and from forward flight to hover are determined. The results have applicability beyond the configuration evaluated. Author

**PREDICTION OF FIGHTER AIRCRAFT DYNAMIC DERIVATIVES USING DIGITAL DATCOM**
W. B. BLAKE (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-4070)

Digital Datcom is evaluated as a design tool for predicting the dynamic derivatives of fighter aircraft. Comparisons are made with wind tunnel data, flight test results, and strip theory predictions for four modern fighter configurations. Accuracy criteria taken from prior studies are used to judge the Digital Datcom predictions. All comparisons except yaw damping are found to be within the accuracy criteria. Author

**DECENNIAL SPECIALISTS' MEETING ON ROTORCRAFT DYNAMICS, 2ND, MOFFETT FIELD, CA, NOVEMBER 7-9, 1984, PROCEEDINGS**
Meeting sponsored by the American Helicopter Society and NASA. Alexandria, VA, AHS, 1984, 342 p. For individual items see A86-11152 to A86-11174.

Various papers on helicopter rotor technology are presented. The subjects considered include: ground resonance analysis using a substructure modelling approach, aerolastic stability of a bearingless rotor, experimentally determined flutter from two and three-bladed model bearingless rotors in hover, lifting surface theory for a helicopter rotor in forward flight, aeroelastic considerations for torsionally soft rotors, and restructuring of a rotor analysis program. Also discussed are: dynamic inflow and its effect on experimental correlations, flap-lag-torsion instability in forward flight, dynamic stability of a bearingless circulation control rotor blade in hover, dynamic response characteristics of a circulation control rotor model pneumatic system, the relations between vibratory loads and airframe vibrations, coupled rotor body vibrations with in-plane degrees of freedom, helicopter vibration reduction concepts. C.D.

**GROUND RESONANCE ANALYSIS USING A SUBSTRUCTURE MODELING APPROACH**
S.-Y. CHEN, A. BERMAN (Kaman Aerospace Corp., Bloomfield, CT), and E. E. AUSTIN (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 9 p. refs

A convenient and versatile procedure for modeling and analyzing ground resonance phenomena is described and illustrated. A computer program is used which dynamically couples differential equations with nonlinear and time dependent coefficients. Each set of differential equations may represent a component such as a rotor, fuselage, landing gear, or a failed damper. Arbitrary combinations of such components may be formulated into a model of a system. When the coupled equations are formed, a procedure is executed which uses a Floquet analysis to determine the stability of the system. Illustrations of the use of the procedures along with the numerical examples are presented. Author

**PARAMETRIC STUDY OF THE AEROELASTIC STABILITY OF A BEARINGLESS ROTOR**
W. E. HOOPER (Boeing Vertol Co., Philadelphia, PA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 15 p. refs

A trade study has been conducted to illustrate the sensitivity of the aeroelastic stability of a bearingless main rotor to the rotor hub coupling parameters that are available for the designer. The results are presented over the complete range of rotor speed and collective pitch available and the effects on air resonance of the 6 beam installation angles are compared together with the results of offsetting the cuff snubber attachment. The major part of the study was conducted using the FLAIR analysis which incorporates a uniform representation of the flexbeam. Results are also shown for a modified version of FLAIR in which the uniform beam is replaced by a member having the geometric tailoring resulting from structural optimization. Author

**NONLINEAR DYNAMICS OF A HELICOPTER MODEL IN GROUND RESONANCE**
E. H. DOWELL (Duke University, Durham, NC) and D. M. TANG IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 10 p. refs
(Contract NSF MEA-83-15193)

An approximate theoretical method is presented which determines the limit cycle behavior of a helicopter model which has one or two nonlinear dampers. The relationship during unstable ground resonance oscillations between lagging motion of the blades and fuselage motion is discussed. An experiment has been carried out on using a helicopter scale model. The experimental results agree with those of the theoretical analysis. Author

### TEST RESULTS FROM A DYNAMIC MODEL DYNAFLEX ROTOR

C. F. NIEBANCK and R. K. GOODMAN (United Technologies Corp., Sikorsky Aircraft Stratford, CT) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 10 p.

A one-fifth scale dynamic model of the Sikorsky Dynaflex rotor has been tested in hover and in forward flight conditions in the United Technologies Research Center Wind Tunnel. The Dynaflex rotor features an advanced composite structure which flexes to provide a constant speed universal joint action. Testing concentrated on confirming that the stability and dynamic response of the rotor were satisfactory. Lift conditions of up to .11 Ct/sigma and advance ratios as high as .46 were reached. Vibratory loads were comparable to those of articulated rotors. The Dynaflex rotor concept appears to be a practical concept from the standpoint of dynamic response and stability. Author

### EXPERIMENTALLY DETERMINED FLUTTER FROM TWO- AND THREE-BLADED MODEL BEARINGLESS ROTORS IN HOVER

W. G. BOUSMAN and S. DAWSON (U.S. Army, Aeromechanics Laboratory, Moffett Field, CA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 19 p. refs

A series of experiments was performed on a 1.8-m-diam model rotor in hover for the principal purpose of investigating the lead-lag stability of isolated bearingless rotors. Incidental to those tests, at least three types of pitch-flap flutter were encountered; those flutter types constitute the subject matter of this paper. Type 1 flutter occurred approximately at the second flap-mode frequency on both two- and three-bladed rotors for both small and large pitch angles and appeared to be a classic pitch-flap flutter. Type 2 flutter showed mostly torsional motion and was seen on both two- and three-bladed rotors. The flutter mode appeared to be the rotor first-torsional mode and the flutter occurred just above 3/rev for low pitch angles. This behavior is similar to wake-excited flutter, but the flutter mode was in the wrong sense for a flutter dependent on lining up of the shed wakes. Type 3 flutter was a regressing flap flutter that occurred for only the three-bladed rotor configurations and appears to be a wake-excited flutter. Although flutter occurred on a number of different configurations, no rotor parameters were identified that were clearly stabilizing or destabilizing. Author

### DEVELOPMENT OF AN UNSTEADY AERODYNAMICS MODEL TO IMPROVE CORRELATION OF COMPUTED BLADE STRESSES WITH TEST DATA

S. T. GANGWANI (Hughes Helicopters, Inc., Culver City, CA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 13 p. refs

A reliable rotor aeroelastic analysis operational at Hughes Helicopters, Inc. that correctly predicts the vibration levels for a helicopter is utilized for the present study to test various unsteady aerodynamics models with the objective of improving the correlation between test and theory. This analysis called Rotor Aeroelastic Vibration (RAVIB) computer program is based on a frequency domain forced response analysis which utilizes the transfer matrix techniques to model helicopter/rotor dynamic systems of varying degrees of complexity. The analysis is a nonmodal analysis and it includes effects of periodic coefficients for the forward flight conditions. The first new aerodynamics model incorporated in the analysis was based on the current state-of-art of unsteady aerodynamics. The results based on this aerodynamics model for the AH-1G helicopter rotor were compared with the flight test data during high speed operation and they indicated a reasonably good correlation for the beamwise and chordwise blade bending moments, but for torsional moments the correlation was poor. As a result, a new aerodynamics model based on unstalled synthesized data derived from the large amplitude oscillating airfoil experiments was developed and tested with RAVIB analysis. The results indicate a significant improvement in the correlation for the torsional moments. Author

### AEROELASTIC CONSIDERATIONS FOR TORSIONALLY SOFT ROTORS

W. R. MANTAY (NASA, Langley Research Center, Hampton, VA) and W. T. YEAGER, JR. (U.S. Army, Structures Laboratory, Hampton, VA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 18 p. refs

A research study was initiated to systematically determine the impact of selected blade tip geometric parameters on conformable rotor performance and loads characteristics. The model articulated rotors included baseline and torsionally soft blades with interchangeable tips. Seven blade tip designs were evaluated on the baseline rotor and six tip designs were tested on the torsionally soft blades. The designs incorporated a systemmatic variation in geometric parameters including sweep, taper, and anhedral. The rotors were evaluated in the NASA Langley Transonic Dynamics Tunnel at several advance ratios, lift and propulsive force values, and tip Mach numbers. A track sensitivity study was also conducted at several advance ratios for both rotors. Based on the test results, tip parameter variations generated significant rotor performance and loads differences for both baseline and torsionally soft blades. Azimuthal variation of elastic twist generated by variations in the tip parameters strongly correlated with rotor performance and loads, but the magnitude of advancing blade elastic twist did not. In addition, fixed system vibratory loads and rotor track for potential conformable rotor candidates appears very sensitive to parametric rotor changes. Author

### OPTICAL DESIGN APPLICATION ON THE ADVANCED AEROELASTIC ROTOR BLADE

F.-S. WEI and R. JONES (Kaman Aerospace Corp., Bloomfield, CT) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 14 p. refs

A vibration and performance optimization procedure using regression analysis has been successfully applied to an advanced aeroelastic blade design study. It is concluded that regression technique can be used in the design of future advanced aeroelastic rotor blades. Multiple optimization can be performed to evaluate the effects of various objective functions and constraint functions or to evaluate the combinations of several objective functions with different weight factors for various mission requirements. Regression technique can directly determine the sensitivity of each blade design variable and analyze the dynamic and aerodynamic effects during the entire design process. The results predicted from the regression equations for performance analysis, modal analysis, and vibration analysis are exceptionally good when compared with the C81 and Myklestad outputs. C.D.

### DEVELOPMENT AND APPLICATION OF A TIME-HISTORY ANALYSIS FOR ROTORCRAFT DYNAMICS BASED ON A COMPONENT APPROACH

R. SOPHER and D. W. HALLOCK IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 15 p. refs

This paper describes a time-history analysis for rotoorcraft dynamics based on dynamical substructures, and non-structural mathematical and aerodynamic components. The analysis is applied to predict helicopter ground resonance and response to rotor damage. Other applications illustrate the stability and steady vibratory responses of stopped and gimballed rotors, representative of new technology. Desirable attributes expected from modern codes are realized, although the analysis does not employ a complete set of techniques identified for advanced software. The analysis is able to handle a comprehensive set of steady state and stability problems with a small library of components. It has responded to new technologies with timely solutions by limiting the effort required to implement new capabilities through its component structure. Opportunities were taken to reduce development costs by addressing more than one type of problem with a single component, such as using a minimum variance controller for trim and vibration reduction. Author

**RESTRUCTURING THE ROTOR ANALYSIS PROGRAM C-60**

P. G. PHELAN and F. J. TARZANIN, JR. (Boeing Vertol Co., Philadelphia, PA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 13 p. refs

The 'restructuring' of the C-60 rotor analysis program in order to meet the increasing software demands of the rotary wing industry is discussed. The motivation for more capable analyses in this industry and the practical limitations of current programs are reviewed, and structured program design is examined as a solution to this problem. A development strategy for structured program design is discussed, and the restructuring process is described in detail. The current status of the restructuring of the C-60 program is addressed. C.D.

**A REVIEW OF DYNAMIC INFLOW AND ITS EFFECT ON EXPERIMENTAL CORRELATIONS**

G. H. GAONKAR (Indian Institute of Science, Bangalore, India) and D. A. PETERS (Washington University, St. Louis, MO) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 15 p. refs

(Contract DAAG29-80-C-0092)

A review is given of the relationship between experimental data and the development of modern dynamic-inflow theory. Some of the most interesting data, first presented 10 years ago at the Dynamic Specialists' Meeting, is now reviewed in light of the newer theories. These pure blade-flapping data correlate very well with analyses that include the new dynamic inflow theory, thus verifying the theory. Experimental data are also presented for damping with coupled inplane and body motions. Although inclusion of dynamic inflow is often required to correlate this coupled data, the data cannot be used to verify any particular dynamic inflow theory due to the uncertainties in modeling the inplane degree of freedom. For verification, pure flapping is required. However, the coupled data do show that inflow is often important in such computations. Author

**INFLUENCE OF VARIOUS UNSTEADY AERODYNAMIC MODELS ON THE AEROMECHANICAL STABILITY OF A HELICOPTER IN GROUND RESONANCE**

P. P. FRIEDMANN and C. VENKATESAN (California, University, Los Angeles) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 12 p. refs

(Contract NAG2-209)

The aeromechanical stability of a helicopter in ground resonance was analyzed, by incorporating five different aerodynamic models in the coupled rotor/fuselage analysis. The sensitivity of the results to changes in aerodynamic modelling was carefully examined. The theoretical results were compared with experimental data and useful conclusions are drawn regarding the role of aerodynamic modeling on this aeromechanical stability problem. The aerodynamic model which provided the best all around correlation with the experimental data was identified. Author

**THE INFLUENCE OF DYNAMIC INFLOW AND TORSIONAL FLEXIBILITY ON ROTOR DAMPING IN FORWARD FLIGHT FROM SYMBOLICALLY GENERATED EQUATIONS**

T. S. R. REDDY and W. WARMBRODT (NASA, Ames Research Center, Moffett Field, CA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 19 p. refs

The combined effects of blade torsion and dynamic inflow on the aeroelastic stability of an elastic rotor blade in forward flight are studied. The Helicopter Equations for Stability and Loads (HESL) program is extended to derive the governing equations of motion for the blade, and a Lagrangian formulation is used to obtain the equations in generalized coordinates. The program generates the steady-state and linearized perturbation equations in symbolic form and then codes them into FORTRAN subroutines. The coefficients for each equation and for each mode are identified through a numerical program; the latter can also be used to obtain the harmonic balance equations. The governing multiblade equations are derived explicitly using HESL. These equations can accommodate any number of elastic blade modes. Stability results are presented for several hingeless rotor blade structural models, and the influence of dynamic inflow in forward flight with an elastic hingeless rotor is investigated. C.D.

**A86-11166#**

**FLAP-LAG-TORSION STABILITY IN FORWARD FLIGHT**

I. CHOPRA (Maryland, University, College Park) and B. PANDA IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 17 p. refs

An aeroelastic stability of three-degree flap-lag-torsion blade in forward flight is examined. Quasisteady aerodynamics with a dynamic inflow model is used. The nonlinear time dependent periodic blade response is calculated using an iterative procedure based on Floquet theory. The periodic perturbation equations are solved for stability using Floquet transition matrix theory as well as constant coefficient approximation in the fixed reference frame. Results are presented for both stiff-inplane and soft-inplane blade configurations. The effects of several parameters on blade stability are examined, including structural coupling, pitch-flap and pitch-lag coupling, torsion stiffness, steady inflow distribution, dynamic inflow, blade response solution and constant coefficient approximation. Author

**A86-11167#**

**DYNAMIC STABILITY OF A BEARINGLESS CIRCULATION CONTROL ROTOR BLADE IN HOVER**

I. CHOPRA (Maryland, University, College Park) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 11 p. refs

(Contract N00167-84-M-1548)

The aeroelastic stability of flap bending, lead-lag bending, and torsion of a circulation-control bearingless blade in hover is studied using a finite element formulation. The multibeams of the flexture and the outboard blade idealized as an elastic beam are discretized into beam elements, each element having 15 nodal degrees of freedom. There is a continuity of axial displacement, flap bending, lead-lag bending, and geometric twist between elements. Quasi-steady strip theory is used to evaluate aerodynamic forces. The airfoil characteristics are represented in the form of data tables. The influence of unsteady aerodynamics is introduced by using dynamic inflow modelling. The formulation is quite general for nonuniform blades. A correlation of analytical and experimental results is made for selected bearingless configurations with conventional airfoil characteristics. C.D.

**A86-11168#**

### DYNAMIC RESPONSE CHARACTERISTICS OF A CIRCULATION CONTROL ROTOR MODEL PNEUMATIC SYSTEM

C. B. WATKINS, S. K. DUTTA (Howard University, Washington, DC), and K. R. READER (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 11 p. refs

Numerical and experimental simulation of unsteady airflow through the control valve and slotted air duct of a circulation control rotor is described. The numerical analysis involves the solution of the quasi-one-dimensional compressible fluid-dynamic equations in the blade air duct together with the coupled isentropic flow equations for flow into the blade through the valve and out of the blade through the Coanda slot. Numerical solutions are compared with basic experimental results obtained for a mockup of a circulation control rotor and its pneumatic valving system. The pneumodynamic phenomena that were observed are discussed with particular emphasis on the characteristic system time lags associated with the response of the flow variables to transient and periodic control valve inputs. Author

### AN EXAMINATION OF THE RELATIONS BETWEEN ROTOR VIBRATORY LOADS AND AIRFRAME VIBRATIONS

C. F. NIEBANCK (United Technologies Corp., Sikorsky Aircraft, Stratford, CT) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 18 p. refs

Harmonic rotor hub loads and airframe interactions in steady flight are reviewed, with regard to the objective of achieving lower airframe vibration by modifying blade root loads. Flight test and wind tunnel data are reviewed, along with sample fuselage response data. Trends which could provide a generalized approach to the above objective are found to be very limited. Recent analytical and corresponding experimental blade tuning modifications are reviewed and compared. Rotor vibratory load modification and substantial vibration changes were achieved over a wide range of rotor operating conditions. It is still concluded that improvement of blade tuning has the potential for reduction in airframe vibration. Current analytical methods are found not accurate enough to confidently predict effects of blade tuning on vibration. Test-based development of favorable blade configurations is shown to be feasible, and will also generate data to guide further development of analytical methods. Author

### PLANNING, CREATING AND DOCUMENTING A NASTRAN FINITE ELEMENT MODEL OF A MODERN-HELICOPTER

R. GABEL, D. REED, R. RICKS, and W. KESACK (Boeing Vertol Co., Philadelphia, PA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 17 p. refs
(Contract NAS1-16460)

Mathematical models based on the finite element method of structural analysis as embodied in the NASTRAN computer code are widely used by the helicopter industry to calculate static internal loads and vibration of airframe structure. The internal loads are routinely used for sizing structural members. The vibration predictions are not yet relied on during design. NASA's Langley Research Center sponsored a program to conduct an application of the finite element method with emphasis on predicting structural vibration. The Army/Boeing CH-47D helicopter was used as the modeling subject. The objective was used to engender the needed trust in vibration predictions using these models and establish a body of modeling guides which would enable confident future prediction of airframe vibration as part of the regular design process. Author

**A86-11171#**

### COUPLED ROTOR-BODY VIBRATIONS WITH INPLANE DEGREES OF FREEDOM

M.-S. HUANG and D. A. PETERS (Washington University, St. Louis, MO) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 15 p. refs
(Contract DAAG29-80-C-0092)

In an effort to understand the vibration mechanisms of helicopters, the following basic studies are considered. A coupled rotor-fuselage vibration analysis including inplane degrees of freedom of both rotor and airframe is performed by matching of rotor and fuselage impedances at the hub. A rigid blade model including hub motion is used to set up the rotor flaplag equations. For the airframe, 9 degrees of freedom and hub offsets are used. The equations are solved by harmonic balance. For a 4-bladed rotor, the coupled responses and hub loads are calculated for various parameters in forward flight. The results show that the addition of inplane degrees of freedom does not significantly affect the vertical vibrations for the cases considered, and that inplane vibrations have similar resonance trends as do flapping vibrations. Author

### ANALYSIS OF POTENTIAL HELICOPTER VIBRATION REDUCTION CONCEPTS

A. J. LANDGREBE and M. W. DAVIS (United Technologies Research Center, East Hartford, CT) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 19 p. Research supported by the United Technologies Corp., U.S. Army, and NASA. refs

Several recent helicopter vibration reduction research programs are described. Results of studies of blade design parameters in rotor vibratory response and of an advanced blade design for reduced vibration are examined. An optimization approach to develop a general automated procedure for rotor blade design is described, and analytical results for an articulated rotor operating at a steady 160 kt flight condition are reported. The use of a self-adaptive controller to implement higher harmonic control in closed-loop fashion is addressed, and a computer simulation used to evaluate and compare the performance of alternative algorithms included in the generic active controller is discussed. Results are presented for steady level flight conditions, short-duration maneuvers, blade stresses and rotor performance, blade-appended aeroelastic devices, vibratory airloads, wake-induced blade airloads, and airloads from blade motions, the interaction of rotor and fuselage, and the interaction of rotor and empennage. C.D.

### ADAPTATION OF A MODERN MEDIUM HELICOPTER (SIKORSKY S-76) TO HIGHER HARMONIC CONTROL

J. J. OLEARY, S. B. R. KOTTAPALLI (United Technologies Corp., Sikorsky Aircraft, Stratford, CT), and M. DAVIS (United Technologies Research Center, East Hartford, CT) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 13 p. refs

Sikorsky Aircraft has performed analytical studies, design analysis risk reduction tests for Higher Harmonic Control on the S-76, an 8-10,000 lb helicopter which cruises at 145 kts. Flight test hardware has been assembled, main servo frequency response tested and upgraded, aircraft control system shake-tested and verified, open loop controllers designed and fabricated, closed loop controllers defined and evaluated, and rotors turning ground and flight tests planned for the near future. Open loop analysis shows that about 2 deg of higher harmonic feathering at the blade 75 percent radius will be required to eliminate 4P vibration in the cockpit. Analytical computer simulations of a closed loop controller have been evaluated relative to the theses of reducing vibration to low levels while maintaining good ride quality and aircraft structural stress attributes. The analytical results, design concepts, program approach, and risk reduction tests are reviewed. Author

### VISCOUS DRAG REDUCTION WITH MICROPOROUS-FACED HONEYCOMB SANDWICH FOR MODERN TURBOFAN INSTALLATIONS

J. S. MOUNT and T.-M. LIU (Rohr Industries, Inc., Chula Vista, CA) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 56-63. refs

The advantages of a structural/acoustic honeycomb sandwich using woven-wire microporous face sheet are examined from the acoustical standpoint. It is shown experimentally that such a sandwich structure is characterized by low drag under duct turbulent flow conditions. A new general mathematical approach linking acoustical and drag properties is then presented. Finally, a nacelle concept is described which uses suction through this type of structure to reduce drag by maintaining laminar flow over the nacelle surface. V.L.

**A86-11614#**

### PERFORMANCE OF A TOP-MOUNTED INLET SYSTEM APPLIED ON TWO COMBAT AIRCRAFT CONCEPTS

K. WIDING (Flygtekniska Forsoksanstalten, Bromma, Sweden) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 135-148.

The wind tunnel testing of a top-mounted inlet design on attacker and fighter aircraft models is discussed. The advantages of a top-mounted inlet design are explained. The attacker and fighter model configurations are described. The attacker model was tested in a low speed wind tunnel at a Mach number of 0.18 and the fighter model was in a transonic-supersonic wind tunnel with Mach numbers ranging from 0.50-1.18. The techniques ued for data acquisition are explained. The results for total pressure losses, steady state distortion indices, and the turbulence index are discussed and graphs are presented. The effects of strakes, central wall, and sideslip on performance is graphically explained. I.F.

**A86-11883**

### OPTIMIZATION OF AIRPLANE WING STRUCTURES UNDER GUST LOADS

S. S. RAO (San Diego State University, CA) Computers and Structures (ISSN 0045-7949), vol. 21, no. 4, 1985, p. 741-749. refs

A methodology is presented for the optimum design of aircraft wing structures subjected to gust loads. The equations of motion, in the form of coupled integro-differential equations, are solved numerically and the stresses in the aircraft wing structure are found for a discrete gust encounter. The gust is assumed to be one minus cosine type and uniform along the span of the wing. In order to find the behavior of the wing structure under gust loads and also to obtain a physical insight into the nature of the optimum solution, the design of the typical section (symmetric double wedge airfoil) is studied by using a graphical procedure. Then a more realistic wing optimization problem is formulated as a constrained nonlinear programming problem based on finite element modeling and the optimum solution is found by using the interior penalty function method. A sensitivity analysis is conducted to find the effects of changes in design variables about the optimum point on the response quantities of the wing structure. Author

### DEVELOPMENT AND APPLICATION OF MATHEMATICAL MODELS OF AIRCRAFT [SOZDANIE I PRIMENENIE MATEMATICHESKIKH MODELEI SAMOLETOV]

A. S. BELOTSERKOVSKII, B. O. KACHANOV, IU. B. KULIFEEV, and V. I. MOROZOV Moscow, Izdatel'stvo Nauka, 1984, 144 p. In Russian. refs

The book is concerned with the mathematical modeling of the motion of aircraft and with the use of mathematical models for studying the aerodynamic and dynamic aircraft characteristics. Attention is given to current models of flutter and methods of flutter analysis with allowance for the nonstationary nature of flow. Models are examined which allow for the elasticity of the structure, various cargo arrangements, effects of the control system, and external perturbations. Examples illustrating the usefulness of mathematical modeling in studying the dynamics of aircraft and in improving the efficiency of onboard equipment are presented. V.L.

**A86-11958**

### RUNWAY AND MANEUVERING PERFORMANCE ENHANCED

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 5, Oct. 1985, p. 12-18.

The U.S. Air Force has investigated approaches which might be used to minimize the degraded operational capability resulting from battle damaged runways. Some of these approaches involve a modification of the aircraft to make an operation from minimum operating strips possible. Until very recently, short takeoff and landing (STOL) tactical fighters were not considered feasible. However, the F-15 STOL demonstrator offers now the possibility of both enhanced maneuverability and improved takeoff and landing performance on the basis of a use of essentially the same devices. An American aerospace company is modifying a standard, two-seat F-15B fighter to investigate several technology areas which may achieve that two-fold objective. Aircraft modifications related to two-dimensional nozzles and canards, and to thrust vectoring are discussed. G.R.

**A86-11959**

### HIGH ANGLE OF ATTACK MANEUVERING PROBED

D. J. HOLT Aerospace Engineering (ISSN 0736-2536), vol. 5, Oct. 1985, p. 20-22.

Extreme flight envelope research is particularly important for high-performance fighter aircraft which can fly in these regimes. Thus, problems arise in connection with aircraft which are to fly at high angles of attack (plus 70 degrees) and at high yaw rates. Such aircraft are susceptible to entering into a spin. In order to deal with these problems, a new program which involves high angle of attack research is being prepared. One of the early phases of this program will be concerned with obtaining a design methodology which will enable the design engineer to correlate in an accurate manner wind tunnel data in the high angle of attack regime with actual flight test data. A second phase of the program will deal with the actual flight testing of a high performance aircraft in the extreme areas of the flight envelope. G.R.

### OBLIQUE WING - NEW APPROACH TO AN OLD PROBLEM

D. J. HOLT Aerospace Engineering (ISSN 0736-2536), vol. 5, Oct. 1985, p. 26-29.

Improvements in aircraft efficiency involve in practice the employment of approaches to reduce the drag. One popular approach involves the use of a variable wing sweep. A NASA program is now concerned with an improved way to achieve variable sweep. This program is referred to as the 'oblique wing research aircraft' (OWRA) program. The oblique wing concept was first explored in the 1940s. Studies conducted by NASA include wind tunnel tests with an aircraft constructed of foam and fiberglass. The results from various investigations have been so promising that NASA and the Navy have entered into a joint research program to resolve remaining uncertainties. If this program is successful, the option to use the oblique wing will be made available in the 1990s. G.R.

### OPTIMUM WING - FOR ALL FLIGHT CONDITIONS?

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 5, Oct. 1985, p. 36-40.

The present paper is concerned with a mission adaptive wing which will automatically adjust its camber to achieve optimum performance throughout the flight envelope. It is pointed out that such a wing is nearing reality. The mission adaptive wing (MAW) installed on the AFTI/F-111 (Advanced Fighter Technology Integration) test bed will soon be proving the concept. Eventually, the mission adaptive wing will operate in four automatic modes, each of which can be selected individually or combined. These modes include the 'cruise camber control', the 'maneuver camber control', the 'maneuver load control', and the 'maneuver enhancement and gust control mode'. G.R.

**JETSTAR SMOOTHES THE WAY**
G. WARWICK Flight International (ISSN 0015-3710), vol. 128, Sept. 21, 1985, p. 32-34.

The development of laminar flow control technology by NASA is examined. Advances which have led to reduced fuel consumption and cost are discussed. The use of laminar flow control to reduce skin-friction drag 25-40 percent is explained. The two test sections developed to evaluate laminar flows, the suction technique used to provide laminar flow control, and the procedure utilized for protection against insects are described. The test aircraft, JetStar, is provided with a Kollenberg probe, a charge patch, and a cockpit display; the instruments functions are explained. The testing of the aircraft in simulated airline operations is described. The use of the F-14 to collect data on pressure distributions over laminar flow aerofoils at different sweep angles, and a DC-9-sized test bed to display suction over the wing leading-edge using the laminar flow aerofoil section to maintain laminar flow is examined. I.F.

**B-1B - BORN AGAIN BOMBER**
N. LYNN Flight International (ISSN 0015-3710), vol. 128, Sept. 21, 1985, p. 39-42.

The development of the B-1B bomber is discussed. The production and delivery schedule, and the flight testing of the aircraft are described. The crash of the B-1A aircraft and the new warning light system developed after the crash are explained. The stability enhancement function added to the stability control augmentation system, and the stall inhibitor system added to the aircraft are examined. An example of foreign object damage to the flapper doors of the B-1B bomber is provided. The offensive avionics system is explained and its proposed production and delivery schedule are given. I.F.

**AHRENS TO BUILD TURBOPROP-POWERED TRANSPORT PROTOTYPES IN SWEDEN**
D. A. BROWN Aviation Week and Space Technology (ISSN 0005-2175), vol. 123, Oct. 7, 1985, p. 61, 62, 64, 69.

The present article is concerned with the KM-180 four-turboprop transport which is being developed by the former head of an American aerospace company. The 40-seat aircraft has been designed as a low-cost, slow-speed, unpressurized transport which can be used profitably by major air carriers on routes on which now 25 persons are carried by a 737. The KM-180 is limited to 200 kt., and has a relatively short range. It is expected that airlines will be able to use the aircraft to provide feeder service on routes which do not provide sufficient traffic to warrant the cost of a jet operation or even a pressurized turboprop. Thus, it would take about 45 min. To fly the route from Malmo to Hamburg, West Germany, in the KM-180. G.R.

**A TECHNICAL-ECONOMICAL ANALYSIS OF AIRSHIPS OF VARIOUS SIZES, SHAPES, AND GAS PERMEABILITY OF THE SHELL [TEKHNIKO-EKONOMICHESKII ANALIZ DIRIZHABLEI RAZLICHNYKH RAZMEROV, FORM I GAZOPRONITSAEMOSTI OBOLOCHEK]**
E. V. GOLDOBEEV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 18-21. In Russian.

Dimensions and performance characteristics are presented for helium airships, and the effect of the aspect ratio of the airship on its mass and aerodynamic characteristics is discussed. A model is then presented for assessing the specific cost (cost per unit area) of aluminum airship shells with a reinforcing structure. Expressions are also presented for calculating the cost effectiveness of airship operation with allowance for the gas permeability of the shell. V.L.

A. A. DUDCHENKO, V. I. REZNICHENKO, V. A. KOZLOV, and O. N. KOCHETKOVA Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 77-79. In Russian.

A procedure for the design of thin-walled reinforced composite structures of the wing and tail unit type is presented. The approach used here involves separating the stress-strain state into the main, slowly varying stress-strain state and the edge effect. The main stress-strain state is analyzed using an updated version of the beam theory; the edge effect is treated on the basis of the Vlasov method. The design procedure is illustrated by a specific example. V.L.

**OPTIMUM DESIGN OF AN AIRCRAFT WING STRUCTURE WITH MULTIPLE CONSTRAINTS BY THE DIRECT-VISION CRITERIA METHOD**
L. LINANG (Shenyang Aircraft Corp.) *In its* Acta Aeron. et Astronautica Sinica (FTD-ID(RS)T-1120-84) p 34-52 4 Oct. 1984 refs Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 4, 1983 p 39-47
Avail: NTIS HC A04/MF A01 CSCL 01A

An optimized computer program (SAFDOP) is introduced which uses the direct vision criteria method for a wing surface structure with multiple constraints. This program can separately carry out analysis, optimization and synthetic optimization calculations of stress, displacement, flutter and static aeroelasticity. The alternate constraint method was used for synthetic optimization calculations. Aside from the stress constraints using the full stress method, each of the other constraints used the uniform derivative criteria. For practical purposes, the element linking weight was used as an independent design variable, in the optimum design the automatic sieve selection design variable and other methods were used and the automatic generation of initial numerical data was considered. This program was used to calculate a typical fighter wing and it proved to be feasible. Author

Avail: US Patent and Trademark Office CSCL 13H

A radome assembly for an airframe and a method for attaching the assembly to an airframe are provided. The radome assembly comprises a ceramic shell with a polymeric transition section bonded thereto, which shell is adapted for mounting to a metal airframe. The transition section has a coefficient of thermal expansion intermediate between that of the ceramic shell and that of the metal airframe. The method of this invention comprises preloading the transition section in circumferential compression when the radome assembly is attached to the airframe. Author (GRA)

(NASA-CR-176231; NAS 1.26:176231) Avail: NTIS HC A09/MF A01 CSCL 01C

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated. Author

**THE DIRIGIBLE: A CATALYST FOR RESOURCE EXPLOITATION IN REMOTE AREAS?**
J. C. MURPHY Apr. 1985 80 p
(AD-A156518; ACSC-85-1950) Avail: NTIS HC A05/MF A01 CSCL 01C

Many developing nations have considerable wealth in natural resources, but are unable to exploit it. Located in remote areas, the countries simply cannot afford to invest the enormous amounts required to build roads, railroads, or airfields to access the regions. The dirigible--modern day blimp--offers a potentially inexpensive, flexible, and capable method of of transporting minerals, timber, or crops in areas without traditional transportation support. Even more important, they can stimulate agricultural or industrial development a significant distance from principal roads thereby unlocking the wealth of the land for a nation. The airship can be the catalyst for colonization at the same time it strengthens the economy. This study provides a cost/benefit model to evaluate the relative benefits of different transportation systems in the exploitation of resources. Author (GRA)

**RETROFIT OF SAC EC-135C AND RC-135 AIRCRAFT WITH CFM-56 ENGINES**
W. N. STOOKE, JR. Apr. 1985 42 p
(AD-A156688; ACSC-85-2630) Avail: NTIS HC A03/MF A01 CSCL 15E

This report is an analysis of the advantages and disadvantages of retrofitting SAC's EC-135C and RC-135 fleet with the CFM-56 engine package being used to convert the KC-135As to KC-135Rs. It reviews selected components of the modification package and compares the performance capabilities of current and modified aircraft during takeoff, cruise, receiver aerial refueling, and landing. The projected fuel savings on the investment dollar are calculated in Af Regulation 173-13, USAF Cost and Planning Factors, and could pay for the retrofit of the 31 aircraft in 18 years. Finally, the advantage of logistics commonality among all three aircraft is assessed. GRA

**PROPOSED MODIFICATIONS FOR THE RAAF AIRTRAINER CT-4A COCKPIT**
K. W. ANDERSON and K. C. HENDY Dec. 1984 23 p
(AD-A156808; ARL/SYS-TM-75) Avail: NTIS HC A02/MF A01 CSCL 01C

The design of the CT-4A Airtrainer cockpit is known to breach numerous ergonomics principles and several ASCC Air Standards. As a result, pilots report problems such as inadequate reach envelopes and obstruction of the control column by the left pilot's left knee. Consequently, the RAAF asked ARL to study the cockpit design and recommend simple changes. An anthropometric model was developed and used to evaluate several patterns of seat adjustment. The best of these (a ramp at 40 degrees to the fuselage reference line) was evaluated in practical trials with an experimental seat in a CT-4A fuselage. For each of the thirty pilot subjects, a sitting position with acceptable view, reach and clearance was found with the experimental arrangement. The ARL recommendations for cockpit modifications include: a smaller left side throttle quadrant with external pushrods, a seat adjustable along a 40 degree ramp, improved instrument lighting, pedals moved forwards, control column modifications, lowered lap belt anchor points, dual fuel gauges and a center transponder location. Incorporation of these recommendations is expected to enhance training effectiveness and improve flying safety. GRA

Laboratory experiments were done to determine the natural frequencies of the electromagnetic resonances of conducting bodies with attached wires. The bodies include two cylinders and an approximate scale model of the NASA F-106B aircraft. All are three feet in length. Time-domain waveforms of B-dot and D-dot were obtained from a sampling oscilloscope, and Prony analysis was used to extract the natural frequencies. This work is an extension of previous work, but smaller, more resistive wires have been used. The first four natural frequencies of the cylinders (and wires) were determined, and a comparison with calculated results of other investigators show reasonable agreement. Seven natural frequencies were determined for the F-106B model (wire wires), and these have been compared with results obtained by NASA in 1982 during direct lightning strikes to the aircraft. The agreement between the corresponding natural frequencies of the model and the aircraft is fairly good and is better than that obtained in the previous work using wires with less resistance. The frequencies lie between 6.5 MHz and 41 MHz, and all of the normalized damping rates are between 0.14 and 0.27. GRA

The identification of the aerodynamic and equivalent derivatives in the longitudinal and lateral motions of modern fighter aircraft is described. Determination of handling qualities parameters through reduced evaluation methods in order to fulfill the requirements of the MIL-F-8785 C calculation is discussed. To accomplish that goal, the highly complex method of observing aircraft motion was reduced by goal-oriented simplifications to a lower order system. The mathematical modeling for various control inputs with and without compensating time-delay, their influence on the results, and their accuracy are outlined. Author (ESA)

This paper describes an experimental version of an expert system flight status monitor being developed at the Dryden Flight Research Facility of the NASA Ames Research Center. This experimental expert system flight status monitor (ESSFSM) is supported by a specialized knowledge acquisition tool that provides the user with a powerful and easy-to-use documentation and rule construction tool. The EESFSM is designed to be a testbed for concepts in rules, inference mechanisms, and knowledge structures to be used in a real-time expert system flight status monitor that will monitor the health and status of the flight control system of state-of-the-art, high-performance, research aircraft. **COMPARISON OF CALCULATED AND MEASURED VELOCITIES NEAR THE TIP OF A MODEL ROTOR BLADE AT TRANSONIC SPEEDS**
M. E. TAUBER, F. K. OWEN (Complere, Inc.), R. G. LANGHI (Informatics General Corp., Palo Alto, Calif.), and G. E. PALMER Aug. 1985 81 p refs
(NASA-TM-86697; REPT-85158; NAS 1.15:86697) Avail: NTIS HC A05/MF A01 CSCL 01C

The ability of the ROT22 code to predict accurately the transonic flow field in the crucial region around and beyond the tip of a high speed rotor blade was assessed. The computations were compared with extensive laser velocimetry measurements made at zero advance ratio and tip Mach numbers of 0.85, 0.88, 0.90, and 0.95. The comparison between theory and experiment was made using 300 scans for the three orthogonal velocity components covering a volume having a height of over one blade chord, a width of nearly two chords, and a length ranging from about 1 to 1.6 chords, depending on the tip speeds. The good agreement between the calculated and measured velocities established the ability of the code to predict the off blade flow field at high tip speeds. This supplements previous comparisons where surface pressures were shown to be well predicted on two different tips at advance ratios to 0.45, especially at the critical 90 deg azimuth blade position. These results demonstrate that the ROT22 code can be used with confidence to predict the important tip region flow field including the occurrence, strength, and location of shock waves causing high drag and noise. **EVALUATION OF FAULT REPORTING/FAULT ISOLATION FOR F-15 AIRCRAFT**
C. A. MUSSARI Apr. 1985 26 p
(AD-A156516; ACSC-85-1955) Avail: NTIS HC A03/MF A01 CSCL 01C

The author set out to see if the accuracy of the FR/FI manuals is a factor in their non-use. Accuracy of the manuals was determined by analyzing actual reported inflight discrepancies. Fault code accuracy was obtained by comparing each discrepancy as written on the TAC Form 122 (Debriefing Record) with the discrepancy depicted in the FR manual. Accuracy of repair actions was obtained by tracking the repair action recommended by the fault isolation manual and comparing it with that shown on the TAC Form 122. Analysis revealed the F-15 fault reporting manual can accurately represent a random inflight malfunction 83.8% of the time, and these malfunctions can be accurately isolated in the fault isolation manual 77.7% of the time. These accuracy levels are acceptable and not a major factor in the non-use of the manuals. Observation of the debriefing and maintenance process, and interviews with aircrews and maintenance technicians, revealed a general lack of understanding and confidence in the FR/FI system. This lack of understanding and confidence, exhibited by both aircrews and maintenance personnel is the primary reason for the system's non-use. Recommended actions to show the effectiveness of using the system as designed are provided. GRA

**A COMPARISON OF THE NAVTOLAND (NAVY VERTICAL TAKEOFF AND LANDING) SH-2F HELICOPTER MODEL WITH THE REQUIREMENTS OF MIL-H-8501A AND WITH FLIGHT DATA Final Report**
R. L. NAVE 31 Jan. 1984 78 p
(Contract F41-400)
(AD-A157297; NADC-84166-60) Avail: NTIS HC A05/MF A01 CSCL 01D

This report compares the dynamic response characteristics of an SH-2F simulator model with available flight test data and with the requirements of MIL-H-8501A, Helicopter Flying and Ground Handling Qualities; General Requirements for. The Navy Vertical Takeoff and Landing (NAVTOLAND) simulator model was developed to facilitate the design of an automatic approach and landing guidance control systems for helicopters and V/STOL aircraft. The simulation was validated by comparing the model response with all available flight test data. In addition, the model was used to examine some of the requirements of MIL-H-8501A. Considerable insight was gained in the application of the specification and in understanding techniques needed to determine compliance with the requirements. The original model was developed and installed on the NASA Ames Vertical Motion Simulator. Numerous modifications were made to the software based on test pilot evaluations. A version of this simulation model including all empirical adjustments was installed on the NAVAIRDEVCEN computer system. Further evaluation of the model was carried out using this batch version of the helicopter model. This study found that it is difficult if not impossible to satisfactorily tune a helicopter simulation based on pilot opinions without a complete flight test data base. The requirements of MIL-H-8501A need to be defined in more detail and in some cases be revised. An altitude excursion limit should be added to the current quick stop maneuver. Analysis indicates that the current 2-second pilot response delay following engine failure may be excessive. GRA

This volume reports a study to select a flight worthy hydraulic system in which to test the chlorotrifluoroethylene (CTFE) hydraulic fluid. Aircraft selection, hardware and concept definition, system and weight analysis, and reliability, maintainability and life cycles costs (LCC) studies are reported in volume 1. The F-15 and KC-10A were selected for comparison between the present fluid and system configuraation and CTFE fluid at 8,000 psi plus various energy conservation and water hammer control concepts. The results show the weight penalty of the nonflammable fluid (CTFE) can be overcome by use of 8,000 psi operating pressures. Performance, water hammer transients, fluid pumpability, sealing, null leakage control, and demonstration system effects were investigated during Phases 2 and 3 of this contract. GRA

**A HELICOPTER TERRAIN FOLLOWING SYSTEM FOR TERMINAL AREA OPERATIONS**
F. G. KILMER, R. L. KILMER (IBM Corp., Federal Systems Div., Owego, NY), H. N. SWENSON (NASA, Ames Research Center, Moffett Field, CA), and A. C. WOODWARD (Texas Instruments, Inc., Dallas) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 8 p.
(AIAA PAPER 85-3092)

This paper discusses the terminal area guidance and terrain following system developed for the USAF HH-60A Night Hawk Search and Rescue Helicopter. A Multi-Mode Radar and three-cue Flight Path Vector Director provide a terrain following capability at all airspeeds, allowing a decelerating approach to a hover over varying terrain to a designated point. Properties of the terrain following design are discussed. Simulation results using the NASA Ames piloted Vertical Motion Simulator are presented. Author

**SIMULATION EVALUATION OF DISPLAY/FLIR CONCEPTS FOR LOW-ALTITUDE, TERRAIN-FOLLOWING HELICOPTER OPERATIONS**
H. N. SWENSON, C. H. PAULK, JR. (NASA, Ames Research Center, Moffett Field, CA), R. L. KILMER, and F. G. KILMER (IBM Corp., Federal Systems Div., Owego, NY) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 11 p. refs
(AIAA PAPER 85-3093)

Trials were run on a six degree of freedom combat helicopter simulator to evaluate head-down displays with integrated FLIR imagery for terrain-following, course-steering, and transition to approach and hover helicopter pilot tasks. Three display formats were tested, providing varying levels of symbology for, e.g., the flight path angle, pitch-attitude data, vertical speed, altitude, etc. The pilots were also furnished flight director guidance, i.e., terrain-following, course steering, airspeed hold, and approach to hover. All the displays permitted the pilots to fly satisfactory mission in the CGI scenarios. The results revealed that the pilots preferred a nonconformal FLIR display superposition. M.S.K.

**TRANSPARENT CONTENTION BUSES CAN IMPROVE ARCHITECTURES**
L. C. KLOS and J. S. HEWELL (General Dynamics Corp., Fort Worth, TX) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 64-74.
(AIAA PAPER 85-5051)

This paper discusses some of the unique architectural aspects of the integration of new systems on aircraft. The paper also describes a data channel approach that meets the diverse and unique requirements of modern avionics. The approach is called 'token passing with transparent contention' and combines a token passing approach for normal operation with a transparent contention approach to handle power-up and bus reconfiguration. The protocol can be used equally well with coaxial cable, fiber optics, or mixed media systems. It provides true distributed control and easily and rapidly overcomes problems due to lost tokens or newly added terminals. Further, it allows a single bus to be dynamically divided into independently operating subnets and supports their smooth reintegration into a single network. Author

**MULTIPROCESSOR APPLICATION IN FLIGHT MANAGEMENT SYSTEMS**
M. K. DEJONGE and T. WILLIAMS (Lear Siegler, Inc., Instrument Div., Grand Rapids, MI) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 172-177. refs
(AIAA PAPER 85-5079)

The Flight Management Computer System (FMCS) for the 737-300 has a three-processor architecture with fixed task allocations divided primarily into the navigation, performance, and input/output functions. The computer architecture uses controlled communication protocol through a global memory accessible to all processors. Advantages of this architecture are in functional separation for testing and validation, and in increased throughput by parallel processing of several system functions. The disadvantage is in the inefficiency of fixed task allocation when a high demand for several tasks allocated to the same processor occur simultaneously, thus limiting the system response time to a single processor's throughput. An alternative multiprocessor architecture for future systems may consider variable task allocation to the processing elements, depending on the availability and capability of each element. A system controller is required to assign tasks as a function of the response priority. In this way, a higher effective throughput is achieved since each processing element is more fully utilized. Issues such as internal bus control, memory access, and priority assignment methods are explored for this type of architecture. Author

**A86-11427#**
**IS THERE A RISC IN THE AVIONIC COMPUTER FUTURE?**
H. SCHMID and T. D. GASKA (General Electric Co., Binghamton, NY) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 185-194. refs
(AIAA PAPER 85-5081)

It has been claimed that Reduced Instruction Set Computers (RISC) offer not only much smaller chips than Complex Instruction Set Computers (CISC) but also more throughput, shorter design time, better support for high level languages, and the ability to emulate other instruction sets. This paper examines these claims and evaluates the possibility of using RISC in real-time avionic control systems that are compatible with MIL-STD-01750. Several methods of translating from 1750 to RISC codes are discussed, and throughput predictions for a VHSIC MIPS are compared with those for the VHSIC 1750 CPUs. B.J.

**WIT - TEST SYSTEM FOR THE MD-80S**
D. R. SWANSON (Douglas Aircraft Co., Long Beach, CA) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 195-201.
(AIAA PAPER 85-5082)

The paper examines the system and hardware for the wire integrity test (WIT) system used to verify the integrity of MD-80 aircraft wiring prior to power-up of critical and expensive avionics hardware. Particular consideration is given to the test plan, the aircraft and WIT data bases, the required hardware, the WIT system, types of tests that may be programmed and test results. The success achieved with WIT is noted. B.J.

**PRECISE VERTICAL SPEED RECONSTRUCTION BASED ON VERTICAL ACCELERATION AND BAROMETRIC ALTITUDE**
A. REDEKER and P. VOERSMANN (Braunschweig, Technische Universitaet, Brunswick, West Germany) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 9, July-Aug. 1985, p. 243-251. refs

The use of two filter algorithms to determine optimum vertical speed estimation is discussed. The equations and diagram explaining the complementary filter and the Luenberger observer are described. The relationship between an estimation of gravitational acceleration and altitude using Newton's gravitational model is provided; vertical acceleration is measured on the Schuler stabilized platform of the inertial navigation system. The hydrostatic equilibrium equation used to measure static pressure is examined. Error models for a vertical accelerometer and a barometric altimeter are presented. The required optimization of the filter parameters is achieved by system simulation; the flight conditions and optimization process are described. The test reveals that the observer is less sensitive than the complementary filter to parametric changes. I.F.

### AIRCRAFT STRUCTURE SURVEILLANCE IN-FLIGHT USING ACOUSTIC EMISSION

P. H. HUTTON (Battelle Pacific Northwest Laboratories, Richland, WA) Journal of Acoustic Emission, Supplement (ISSN 0730-0050), vol. 4, Apr.-Sept. 1985, p. S138-S141. refs

For a long time, an application of acoustic emission (AE) techniques to the surveillance of critical components in aircraft structures has been considered, taking into account possibilities to detect cracking. The amount of research devoted to such an application, however, has been comparatively small, although there have been some significant development results. The present paper provides a description of a number of cases of such research with the objective to give a perspective of the level of accomplishment. The reported results show the basic feasibility of an in-flight AE monitoring approach. The application of in-flight AE monitoring is being considered in a context of cost effectiveness which results on the basis of the reduction of conventional inspection requirements. G.R.

**A86-12574**

### IN-FLIGHT MONITORING FOR INCIPIENT CRACKS IN AN AERO ENGINE MOUNT - AN APPROACH THROUGH PATTERN RECOGNITION

C. R. L. MURTHY, M. A. MAJEED, S. C. PATHAK, and A. K. RAO (Indian Institute of Science, Bangalore, India) Journal of Acoustic Emission, Supplement (ISSN 0730-0050), vol. 4, Apr.-Sept. 1985, p. S147-S150. Research supported by the Aeronautical Research and Development Board.

In-flight monitoring for incipient cracks in critical structural members of an aircraft is a vital need for ensuring safety and operational reliability. A nondestructive, dynamic technique with the capability for in-service monitoring is required. Such a technique can be based on a utilization of acoustic emission (AE). However, the development of a suitable, reliable procedure requires a number of investigations to overcome certain difficulties. Thus, in addition to growing cracks, there are several other pseudosources which give rise to signals which are identical in appearance to acoustic emissions. The present study is concerned with the applicability of principles for source characterization in-flight, taking into account an example involving the testing of a simulated aircraft engine mount in the laboratory as a first step. Attention is given to the design of the mount, the experimental program, a cluster analysis of AE data, software development, and data analysis. G.R.

### PROPFANS GEAR UP

R. DEMEIS Aerospace America (ISSN 0740-722X), vol. 24, Oct. 1985, p. 22, 24.

The use of a gearbox or a direct-drive engine to power the propfan is examined. The advantages of a gearbox which allows for maximum efficiency are discussed. The smaller direct-drive engine requires 9 percent more hp, weighs 3 percent more, and is 3-5 percent less fuel efficient. The one major advantage of the direct-drive engine is that the elimination of the complex gearbox will permit easier maintenance. The mean time between unscheduled removal of the gearbox for military and commercial aircraft and the types of problems encountered are explained. The material improvements and advanced design techniques, which will reduce all nonmaintenance removal of gearboxes, are described. The use of counter-rotating blades, tapered roller bearing, multispool engine cores, and a hub-mounted electronic pitch change controller to simplify the gearbox is examined. The specific aircraft configuration and its use strongly influence the choice between a geared or gearless propfan. I.F.

**A86-10360**

### VERSATILE, LOW COST TURBOJET PROPULSION FOR UNMANNED VEHICLES

D. E. BARBEAU (Teledyne CAE, Toledo, OH) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 12.1-12.11.

The advantages of a 'family' approach to the design of turbojet engines for unmanned vehicles are discussed. Attention is given to the family of engine designs based on the J402-CA-400 engine of the Harpoon anti-ship missile which serves as the basis for today's low cost propulsion systems in ALCMs, SLCMs, targets, and decoys. The salient features of the J402-CA-400 engine are described, and examples of tailoring to the design requirements of other unmanned vehicles are presented. Among the specific systems considered are: the J402-CA-700 engine for the MQM-107 target drone; the J402-CA-401 engine of the Medium Range Air-to-Surface Missile (MRASM); and the 374-8 engine of the BQM-PI target drone of the U.S. Navy. Some cost factors associated with tailored engine designs are also discussed, including acquisition costs; development costs; and production costs. I.H.

**A86-10361**

### PRESENT AND FUTURE TRENDS IN TURBOJETS AND TURBOFANS FOR R.P.V'S

R. W. CROSS and C. GREGORY (Ames Industrial, Ltd., Fareham, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 13.1-13.12.

Future market trends and design concepts for low-cost turbojet and turbofan engines for RPV applications are discussed. Emphasis is given to the development of gas turbines for missiles, decoys, and target drones. Some of the performance requirements of next generation turbo engines are discussed, including turbofan engines for LRSOMs, small engines for low-profile surveillance RPVs; and supersonic engines for target drones. The product line of a British turboengine manufacturer is described and line drawings of the different engine designs are provided. I.H.

**A86-10362**

### THE STATUS OF A LOW COST GAS TURBINE PROGRAMME

A. J. PURCHASE (Normalair-Garrett, Ltd., Yeovil, England), D. W. ARTT, and N. F. ADAMS (Belfast, Queen's University, Northern Ireland) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 14.1-14.8.

British efforts to develop a low-cost turbine engines unmanned vehicles are described. Attention is given to the engineering program associated with the design of a turbocharger-based engine having 600 N of static thrust. The turbocharger core of the engine was based on existing turbocharger designs. The vaneless diffuser was replaced by an island diffuser and a plenum which also housed the airstart jets and the combustor. The combustor was a conventional reverse flow single can unit made of stainless steel. An electronically controlled fuel system was used to supply oil to the spill burner, with fuel flow controlled by a motor actuated valve in the spill control line. Results of 20 hours of continuous testing of the engine at speeds up to 75000 rpm are preserved. A photograph of the engine on its test-bed is provided. I.H.

**THE EFFECT OF ACOUSTICALLY LINED WALLS ON CASCADE FLUTTER**

S. KAJI (Tokyo, University, Japan) and T. WATANABE JSME, Bulletin (ISSN 0021-3764), vol. 28, July 1985, p. 1359-1366. refs

A linear three-dimensional cascade is modelled using a semiactuator disk. The model takes the effects of both the steady flow turning and the total pressure loss across the cascade into account. The flow field disturbed by the bending oscillation of blades is divided into three regions, the upstream, inside, and downstream of the cascade. In each flow region, the governing equations are solved separately to satisfy the boundary conditions at both tip and hub walls. The regions are then connected to each other to meet the boundary conditions on the leading edge plane and the trailing edge plane of the cascade. The aerodynamic forces acting on the blades can be calculated by applying the momentum principle. It is shown that an acoustically lined wall can stabilize as well as destabilize blade oscillation, depending on its acoustic admittance. C.D.

**AIRCRAFT TURBOFANS - NEW ECONOMIC AND ENVIRONMENTAL BENEFITS**

F. R. SAMPL and M. E. SHANK (United Technologies Corp., Pratt and Whitney Engineering Div., East Hartford, CT) Mechanical Engineering (ISSN 0025-6501), vol. 107, Sept. 1985, p. 47-53.

The reduction of fuel consumption has a great economical significance for the operation of aircraft, because fuel costs account for approximately 50 percent of the direct operating expenses in commercial aircraft engines. Much progress with respect to such a reduction has already been made, and modern jets burn 40 percent less fuel than early turbojets. However, the introduction of advanced turbofan and turboprop engines is expected to reduce fuel consumption by another 40 percent. NASA's Engine Component Improvement (ECI) and Energy Efficient Engine (EEE) programs represent two of the most notable programs dedicated to the reduction of fuel consumption. A number of developments leading to decreased fuel consumption are discussed, taking into account controlled diffusion airfoils, advances in aircraft engine technology, mechanics and electronics, and new materials. G.R.

**INTEGRATED FLIGHT/PROPULSION CONTROL - METHODOLOGY, DESIGN, AND EVALUATION**

K. L. SMITH (General Dynamics Corp., Fort Worth, TX), W. B. KERR (United Technologies Corp., Pratt and Whitney Aircraft Div., West Palm Beach, FL), G. L. HARTMANN (Honeywell, Inc., Minneapolis, MN), and C. SKIRA (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 24 p. refs

(AIAA PAPER 85-3048)

Details of the activities performed during each of four phases of the U.S.A.F. Design Methods for Integrated Control Systems program which produced a set of integrated flight/propulsion control laws are summarized. Phase I produced the integrated control system design requirements for STOL, terrain following/threat avoidance/obstacle avoidance, air-to-air combat maneuvering, air-to-surface combat maneuvering, and supersonic cruise. Phase II work yielded a nonlinear simulation model for steady-state and dynamic characteristics of the aircraft, inlet, engine and nozzle, using a modified F-16XL as the testbed. The design and development of the control logic for each mission segment were accomplished in Phase IV, with the logic being evaluated with the Phase III simulation model. M.S.K.

**STUDY OF TURBINE BYPASS REMOTE AUGMENTOR LIFT SYSTEM FOR V/STOL AIRCRAFT**

A. E. SHERIDAN (General Dynamics Corp., Fort Worth, TX) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 14 p. NASA-sponsored research. refs

(AIAA PAPER 85-3086)

The airframe design and engine/aircraft integration were emphasized in a NASA comparative study of turbofan and turbine bypass engine (TBE) with remote augmentor lift systems (RALS) for supersonic V/STOL aircraft. Functional features of the TBE are reviewed, noting the enhanced cycle efficiency and reduced afterbody drag compared to the turbojets. The present studies examied performance levels for aircraft with fleet defense and secondary anti-surface warfare roles, carrying AMRAAM and AIM missiles. TBE engine cycles were configured for hover and up-and-away flight from deck launch, and all tests were done from a conceptual design viewpoint. The results indicate that the TBE-RALS is superior to turbofan-RALS aircraft in both gross take-off weight and life cycle cost. M.S.K.

**A86-10969*#** National Aeronautics and Space Administration. Flight Research Center, Edwards, Calif.

**NET THRUST CALCULATION SENSITIVITY OF AN AFTERBURNING TURBOFAN ENGINE TO VARIATIONS IN INPUT PARAMETERS**

D. L. HUGHES, R. J. RAY (NASA, Flight Research Center, Edwards, CA), and J. T. WALTON AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 9 p.

(AIAA PAPER 85-4041)

The calculated value of net thrust of an aircraft powered by a General Electric F404-GE-400 afterburning turbofan engine was evaluated for its sensitivity to various input parameters. The effects of a 1.0-percent change in each input parameter on the calculated value of net thrust with two calculation methods are compared. This paper presents the results of these comparisons and also gives the estimated accuracy of the overall net thrust calculation as determined from the influence coefficients and estimated parameter measurement accuracies. Author

**A86-10971#**

**DESIGN AND DEVELOPMENT OF A POWER TAKEOFF (PTO) SHAFT FOR THE X-29 FORWARD SWEPT WING (FSW) DEMONSTRATOR AIRCRAFT**

D. J. GARGIULO (Grumman Aerospace Corp., Bethpage, NY) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 9 p.

(AIAA PAPER 85-4045A)

The X-29 Forward Swept Wing (FSW) aircraft required a power takeoff (PTO) shaft to transmit power from the starter to the engine during engine starting and to transmit power from the engine to the remote gearbox during ground and flight operations for aircraft accessories. Shaft design requirements of high speed and great length could not be met with off-the-shelf designs. Meeting adequate critical speed margin posed a significant design problem. Various shaft concepts were studied. The final selection was a graphite epoxy center shaft utilizing metal flexible end assemblies. Extensive testing at unit, subsystem, and system levels proved the adequacy of the design. Author

**A86-11601**

**INTERNATIONAL SYMPOSIUM ON AIR BREATHING ENGINES, 7TH, BEIJING, PEOPLE'S REPUBLIC OF CHINA, SEPTEMBER 2-6, 1985, PROCEEDINGS**

Symposium sponsored by the Chinese Society of Engineering Thermophysics and International Society for Air Breathing Engines. New York, AIAA, 1985, 826 p. For individual items see A86-11602 to A86-11698.

The symposium presents general topics on nozzle and external flows; gas turbine combustor developments; inlets; mechanical aspects; ramjets; controls, diagnostics, and instrumentation;

turbomachinery; combustion stability and modeling; and propulsin systems and test facilities. Other topics include inviscid flow in turbomachinery, operations and monitoring, fuel injection, viscous effects in turbomachinery, unsteady effects in turbomachinery, and combustor performance correlations. Papers are presented on aero gas turbine engines for commercial application, combustion research for gas turbine engines, numerical simulation of self-excited oscillations in a ramjet inlet-diffuser flow, some recent advances in the instrumentation of airbreathing engines, and numerical modeling of afterburner combustion. In addition, consideration is given to procedures for trending aircraft gas turbine engine performance, simultaneous measurement of velocities and particle sizes for injection systems and ramjet combustors, and energy losses of equilibrium three-dimensional boundary layer. I.S.

**A86-11603#**

**THE ROLE OF COMPUTATIONAL TECHNIC IN THE DEVELOPMENT OF HIGH PERFORMANCE AIRBREATHING ENGINES**

J. ROSSIGNOL (SNECMA, Paris, France) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 25-32.

The effect of advanced computational techniques on the development and design of aircraft engines is reviewed with reference to specific examples. In particular, attention is given to the computation of airfoils and of subsonic and transonic flow around airfoils and coupling with the boundary layer; analysis of secondary aerodynamic phenomena; computation of off-design performance and analytical assessment of the compressor map; and compressor stability analysis. The discussion also covers the application of finite element methods and three-dimensional models to mechanical design; combustion modeling; manufacturing process improvement and computerization of the links between design engineering and manufacturing engineering. V.L.

**A86-11604#**

**AERO GAS TURBINE ENGINES FOR COMMERCIAL APPLICATION**

A. G. NEWTON (Rolls-Royce, Ltd., Derby, England) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 33-41.

The progress made in improving the standard of gas turbine engines for commercial applications is briefly reviewed. It is then shown that further gains are possible with the tools that are currently available. Some of these gains could come from the direct applications of available technology to the components of the current configuration of engines or they may be associated with different configurations. Either new versions of the turbo fan engine or even the propeller may come back into use if some significant problems are resolved. These problems include the development of a high-power gearbox, suppression of noise and vibration in the cabin, the development of an advanced propeller, and the development of a suitable gas generator. The economic aspects of such developments are also examined. V.L.

**A86-11608#**

**COMBUSTION ENGINEERING AND RESEARCH FOR GAS TURBINES**

W. W. WAGNER (U.S. Navy, Naval Air Propulsion Test Center, Trenton, NJ) and S. N. B. MURTHY (Purdue University, West Lafayette, IN) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 87-91. refs

The continuing and emerging engineering concerns in gas turbine combustors and several research needs arising from them are reviewed. In particular, improvements are required in compactness, loading, injector performance, linear temperature distribution, uniformity of product composition and temperature both along the chamber and at the exit plane, and manufacture and life. The research that can be expected to bring about such improvements is discussed under the following headings: air supply, design and scales, fuel effects, heat transfer and durability, and control of combustor and engine performance. V.L.

**COMBUSTION RESEARCH FOR GAS TURBINE ENGINES**

E. J. MULARZ (U.S. Army, Propulsion Laboratory, Cleveland, OH) and R. W. CLAUS (NASA, Lewis Research Center, Cleveland, OH) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 92-100. Army-supported research. Previously announced in STAR as N85-21164. refs

Research on combustion is being conducted at Lewis Research Center to provide improved analytical models of the complex flow and chemical reaction processes which occur in the combustor of gas turbine engines and other aeropropulsion systems. The objective of the research is to obtain a better understanding of the various physical processes that occur in the gas turbine combustor in order to develop models and numerical codes which can accurately describe these processes. Activities include in-house research projects, university grants, and industry contracts and are classified under the subject areas of advanced numerics, fuel sprays, fluid mixing, and radiation-chemistry. Results are high-lighted from several projects. Author

**A86-11610#**

**DEVELOPMENT OF NEW COMBUSTOR TECHNOLOGIES AT SNECMA**

G. B. LABOURE (SNECMA, Villaroche, France) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 101-108. refs

Major steps of the evolution in the design of the aircraft engine combustors are presented, with discussion of the available design techniques and their advantages, drawbacks and limitations. In particular, the evolution of technology and possible future design trends concerning the combustor injection system, efficiency/pollution performance, reduction in size, cooling technology, and the control and optimizing of the mechanical systems are discussed. The design principles of various combustor features are illustrated graphically. I.S.

**DETERMINATION OF HIGH CYCLE FATIGUE LIFE OF AXIAL COMPRESSOR BLADES OF TURBOJET ENGINES FITTED IN MILITARY AIRCRAFT**

M. L. SIDANA, R. V. NARAYANA MURTHY, and K. SRINIVASA (Defence Research and Development Organization, Directorate of Aeronautics, Bangalore, India) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 173-177.

Results are presented of a study on fatigue life usage rates at various intervals of service hours of the rotor blades in a seven-stage axial compressor that was used in three types of aircraft (fighter, interceptor, and trainer). The rotor blades, made of aluminum alloy RR 58, were tested by means of an electromagnetic exciter linked to a blade-holding block. It was found in the initial studies that from the point of view of the high cycle fatigue (HCF) the second and the third stage rotor blades are the critical ones. The HCF life was highly dependent upon the initial fatigue strength and was a function of vibration environment in terms of the 'af' level in the particular engine installation. The 'af' level in turn depends on the pressure/velocity distortion factors at the engine intake face. I.S

**DIAGNOSIS AND CURE FOR A FATIGUE PROBLEM IN THE TURBINE ROTOR OF A SMALL TURBO-ENGINE**

A. J. VAN WYK and G. V. HOBSON (Council for Scientific and Industrial Research, National Institute for Aeronautics and Systems Technology, Pretoria, Republic of South Africa) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 207-211.

Computed and measured blade vibration characteristics of a turbine wheel are discussed in conjunction with engine speed starting characteristics of an integrally cast impulse turbine that failed during its first test. All the turbine blades of the gas generator broke off at their roots causing extensive damage to the exhaust/diffusor housing. The blade vibration and the impulse starter system characteristics were analysed and related to the failure, and the corrective actions recommended. These include static measurement of all modes and their frequencies, with a stress on the usefulness of nonintrusive techniques like laser holography, keeping the historical records of all parameters in a suitable format for a quick backtracking, and a full aeroelastic investigation of turbine blades in simulated rig tests or, ultimately, under real operating conditions. I.S.

**A86-11624#**

**RAMJET RESEARCH IN FRANCE - REALITIES AND PERSPECTIVES**

R. MARGUET and PH. CAZIN (ONERA, Chatillon-sous-Bagneux, France) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 215-224. refs
(ONERA, TP NO. 1985-108)

Thirty years of ramjet research in France are presented, which can be divided into three historical periods: tests on conventional configurations, with the front air intakes and jettisoned boosters (1955-1965), theoretical and experimental research on the hypersonic ramjet for flights at over Mach 6 (1965-1972), and, since 1972, return to moderate supersonic speed ramjets with new designs, more competitive and compatible with operational requirements. Various architectural ramjet configurations, ramjet combustors with the integral booster, compact engine using liquid fuels with high volumetric energy and with solid fuel, and ramrockets with solid fuel containing oxidizer are discussed together with test methods and facilities. Future trends in the ramjet research and development are outlined, stressing the orientation towards military applications. I.S.

**A86-11641#**

**NUMERICAL MODELING OF AFTERBURNER COMBUSTION**

X. ZHANG (Shenyang Aeroengine Research Institute, People's Republic of China) and H.-H. CHIU (Illinois, University, Chicago) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 359-369. refs

A numerical method and a computer code for modeling the afterburner and gas phase combustion processes in turbofan or turbojet afterburners were developed on the basis of the Navier-Stokes equation and a finite difference method. The computer code was shown to be effective and versatile. The numerical analysis revealed that the recirculation zone in the combusting flow is much shorter than in the noncombusting afterburner flow. The multiphase combustion efficiency depends on the principal spray combustion processes. All phenomena reflected by the numerical results coincided with some known experimental data. I.S.

**REAL-TIME ENGINE TESTING IN THE AEROPROPULSION SYSTEMS TEST FACILITY**

N. W. HAARS and J. G. MITCHELL (USAF, Arnold Engineering Development Center, Arnold Air Force Station, TN) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 401-407.

The design and development of the Aeropropulsion Systems Test Facility (ASTF) is discussed. The real-time-test (RTT) capability provided by the facility is explained. The advantages and disadvantages of steady-state testing procedures are described and compared with RTT capabilities. The improved testing provided by the control and data systems of the ASTF are discussed. Inlet/engine testing, maneuver transient simulation, and the testing of engine power transients, which are new procedures provided by the ASTF, are explained. The trends in aviation that were studied during the planning of ASTF and the development schedule for the facility are examined. The low cost, time saving testing possible with the RTT at ASTF is explained. I.F.

**A STUDY ON PERFORMANCES OF VARIABLE GEOMETRY TURBOFAN ENGINES UTILIZING AN APPROXIMATED ANALYTICAL METHOD**

C. SANCHEZ TARIFA (Madrid, Universidad Politecnica, Spain) and M. A. LOPEZ AGUILAR (Iberia Lineas Aereas de Espana, Madrid, Spain) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 413-417.

The influence of varying exhaust nozzle areas and specific work of the fan on the fuel consumption of turbofan engines is examined. The analytical expressions used in the approximation method to calculate the performance of both compressors and fan are provided. The actual and calculated data on engine performance are compared and show good correlation. The test parameters are described. The results obtained for specific fuel consumption at take-off and cruise conditions are graphically explained; the data reveals that an increase of exhaust areas will reduce fuel consumption. The data obtained from varying fan flows are discussed. I.F.

**A86-11649#**

**DESIGN CHARACTERISTICS OF A NEW GENERATION TURBOSHAFT ENGINE**

K. TRAPPMANN (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 418-425. refs

Design considerations for a helicopter turboshaft engine are discussed. The functional and economic requirements for engine designs are explained. A diagram of a 900 kW turboshaft engine for a twin engine helicopter and the advantages of its axial/radial compressor and combustion chamber are described. The evaluation of the engine design and the improvements required are examined. A new engine design, which was developed because of major advances in compressor and turbine aerodynamics, is described. A comparison of the combustion chamber, and compressor turbine and cooling system of the two engine designs is provided; the improvements required in the new design are explained. I.F.

**THE AERODYNAMIC AND THERMODYNAMIC DESIGN OF A SMALL TURBOJET**

C. MASSARO, S. COLANTUONI, P. DI MARTINO, G. LIOTTI (Alfa Romeo Avio S.p.A., Naples, Italy), and G. TORELLA (Italian Air Force Academy, Italy) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 426-432. refs

This paper deals with the activities carried out during the AR/TJ140 small turbojet design and development. The theoretical, experimental and numerical methods that have been set up are based on the experiences made during the design of ESM 600 turboshaft and AR318 turboprop engines. The problems connected with the different phases of the project are considered here. The paper deals with design choice, compressor and turbine aerodynamic problems and with performance predictions. For each argument the problems that have been met and the selected solutions are shown. Author

**ENGINE PERFORMANCE MONITORING IN HELICOPTERS**

D. E. GLENNY (Aeronautical Research Laboratories, Melbourne, Australia) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 513-519.

Methods to monitor the performance of helicopter engines are described. The first method, manual In-Flight Monitoring (IFM) relies solely on data manually recorded by the pilot and interpretations by maintenance personnel. The second method, a computerized engine performance monitoring system, consists of a set of automatically recorded data and a gas flow analysis routine to diagnose performance trends in flight. The data screening requirements of the automatic system are described, and some preliminary results of 300 hours of tests on a T53-Li3 helicopter engine are presented. It is shown that, except for obvious instrument malfunctions, torque drop-outs, and speed fluctuations, consistent trends in engine performance parameters can be accurately predicted using the automatic system. Trend plots of the torque of the T53-L13 engine are given in a table. I.H.

**PROCEDURES FOR TRENDING AIRCRAFT GAS TURBINE ENGINE PERFORMANCE**

D. A. FRITH and P. C. FRITH (Aeronautical Research Laboratories, Melbourne, Australia) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 520-527. refs

A procedure is proposed to extract information from aircraft engine performance measurements. The condition parameters used in the procedure include: blade erosion, seal wear, and deterioration in the gas path regions of the engine. Some sources of noise error in performance measurements are discussed, and the use of an uncertainty interval to identify hidden biases in predicted trends is described. A flowchart for the procedure is provided. I.H.

**A86-11663#**

**JT9D ENGINE/MODULE PERFORMANCE DETERIORATION RESULTS FROM BACK TO BACK TESTING**

O. SASAHARA (Japan Air Lines, Co., Ltd., Tokyo, Japan) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 528-535.

The results of back-to-back performance testing of JT9D-7A gas turbine commercial aircraft engines are presented. Specific performance losses were computed for individual engine modules using a Module Analysis Program (MAP). The performance deterioration data for individual gas-path modules are derived and some damage mechanisms are examined. A list of the dependent and independent variables in the performance data is obtained on the basis of the computer analysis. A detailed line drawing of the JT9D engine is provided. I.H.

**A86-11664#**

**CERTAIN ALGORITHMS RELATED TO 'ENGINE CONDITION MONITORING' SYSTEMS**

TH. TH. PANIDIS and D. D. PAPAILIOU (Patras, University, Greece) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 536-539.

The algorithms used to predict gas turbine engine performance in conjunction with the Gas Path Analysis (GPA) technique are described. The function of the algorithms is to relate engine parameter derivations from their normal values to corresponding cases of engine failure. Deviating parameters are compared to sets of parameter matrices which describe the possible sources of engine defect using a Set of Deviating Parameters Algorithm (SPDA). Existing faults are identified using Condition Vector Algorithms (CVAs) to provide quantitative information regarding the parameter deviations. An Engine Monitoring (ECM) system integrating the two algorithms is described and its application to defect analysis in a three-spool turbofan engine is discussed. I.H.

**A86-11665#**

**HOSTILE ATMOSPHERIC ENVIRONMENT EFFECTS ON JET ENGINES**

W. TABAKOFF and A. HAMED (Cincinnati, University, OH) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 540-549. refs
(Contract DAAG29-82-K-0029)

The dynamics of solid particles ingested through a helicopter turbine engine having an inlet particle separator have been investigated, theoretically. The distribution of the unseparated particles and the locations of particle-blade impacts were determined by computing the particle trajectories through the five stage axial compressor. It is shown that the distribution of particle impacts is not uniform between the blade pressure surfaces and the blade section surfaces in the compressors and stators. The patterns of blade erosion due to particle impacts are illustrated in a series of line drawings. I.H.

**A86-11666#**

**INITIAL DISPERSION OF JET ENGINE EXHAUST PLUME**

T. SAWADA (Osaka Prefecture, University, Sakai, Japan) and A. NISHI (Miyazaki University, Kirishima, Japan) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 550-557. refs

Experiments were carried out using a laboratory model in order to study the physical characteristics of a co-axial jet engine exhaust plume near the ground. Estimates are obtained of the velocity, temperature, and chemical composition of the model jet, and the results are compared with field measurements collected at Chitose Airport in Hokkaido, Japan. The combined data are used to predict the deflection of the jet axis due to cross winds and the different buoyancies of the jet flow in the idle mode and during takeoff. I.H.

**A86-11693#**

**A STUDY OF THE FREQUENCY RESPONSE OF A TURBOJET ENGINE TO TURBULENCE-TYPE DYNAMIC DISTORTION**

F. CHEN, W. LI, Z. WANG, M. CONG (Northwestern Polytechnical University, Xian, People's Republic of China), and S. LIU IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 765-771. refs

A study of frequency response of a turbojet engine to turbulence-type dynamic inlet distortion (TTDD) was studied, analyzing the input/output compressor signals by means of a statistical analysis technique for stochastic processes. The TTDD was generated by a plate with 180 deg extent and 50 percent blockage ratio at the engine face. The results indicate that the engine compressor system is most sensitive to the intermediate frequency fluctuations just before the onset of surge. I.S.

**TRANSPORTATION AND IMPINGEMENT/EFFUSION COOLING OF GAS TURBINE COMBUSTION CHAMBERS**
G. E. ANDREWS, A. A. ASERE, C. I. HUSSAIN, and M. L. MKPADI (Leeds, University, England) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 794-803. refs
(Contract SERC-GR/B/67827; SERC-B/00336; SERC-GR/C/59192)

The overall cooling effectiveness of a combined impingement plate (IP)-full coverage discrete hole effusion (E) cooling system for cooling gas turbine chambers was compared to the transpiration (T), or porous wall cooling. The phenomenon of heating the IP by the impingement air was also investigated. At low coolant flow rates, the E cooling could match the film cooling effectiveness of a fully porous wall. The lower overall cooling effectivenesss performance consequently results from inferior internal wall cooling. Although the combination of IP with E led to a major improvement in the overall cooling effectiveness, it remained inferior to the T cooling system. Heating of IP by the reflected impingement jets is maximized at low coolant flow rates and small impingement hole diameter, but is not influenced by the distance between the IP and the air source in the distance range of 3-12 mm. I.S.

**DEPOSITS IN AIRCRAFT ENGINES. I - TYPE OF DEPOSITS AND TEST METHODS [ABLAGERUNGEN IN FLUGTRIEBWERKEN. I - ERSCHEINUNGSFORMEN UND TESTMETHODEN]**
K. MAIER (Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) and E. JANTZEN (DFVLR, Institut fuer technische Physik, Stuttgart, West Germany) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 9, July-Aug. 1985, p. 211-217. In German. refs

Oil-reaction-product deposit formations in the oil systems of aircraft engines are examined. The location and the types of deposits detected and the factors which influence their formation are explained and diagrams of deposit formations are provided. The characteristics of the deposits, which are used to classify them, are described. The laboratory techniques used to study deposit formations, which include static and dynamic electric stress tests in the liquid phase, droplet phase tests, and oil steam phase tests, are analyzed and examples of specific equipment utilized are presented. The specifications which must be followed when using these techniques are presented and the effect of temperature on deposit formation is discussed. I.F.

**AEROJET TECHSYSTEMS DEVELOPS HYPERSONIC AIRCRAFT ENGINE**
J. T. MERRIFIELD Aviation Week and Space Technology (ISSN 0005-2175), vol. 123, Oct. 14, 1985, p. 57, 59, 60, 65.

An American aerospace company is developing the Airturboramjet engine for hypersonic transatmospheric vehicles. It is believed that the engine could be ready for a flight demonstration within four years. The Airturboramjet, designed to operate like a turbojet at subsonic speeds and like a fan-boosted ramjet at supersonic and hypersonic speeds, could provide the necessary propulsion for hypersonic transport which has been proposed. A three-year project is to prove the concept of a hydrogen-fueled Airturboramjet. The project includes design, fabrication, and testing of a subscale engine at simulated Mach 5 and 100,000-ft altitude conditions. G.R.

**TAY FOR TWO**
J. MOXON Flight International (ISSN 0015-3710), vol. 128, Sept. 28, 1985, p. 21-26.

The development of a turbofan, Tay, is described. The Spey Mk 555 was used as the basis for the Tay engine. The use of the engine in two aircraft and the need for the engine to be produced at reasonable cost are explained. The reduction of the high jet velocity by raising the bypass ratio is discussed. The development of a low-pressure spool, and an intermediate-pressure compressor are described; the functions of the intermediate-pressure compressor are discussed. A new combustor, a 12-lobe exhaust mixer, an acoustic liner to reduce noise, and an all-composite bypass duct used in the design of the turbofan are explained. A diagram of the Tay engine is provided. I.F.

**A86-12365**
**PROPELLER POWER**
M. HIRST Air International (ISSN 0306-5634), vol. 29, Oct. 1985, p. 190-194.

The evolution of the propeller due to advances in turboprop technology is discussed. The development of variable-pitch propellers and examples of aircraft utilizing them are described. The need to reduce the rotation speed between the gas turbine and the propeller drive shaft, in the variable pitch propeller, led to a turboprop engine; the characteristics of this engine type are explained. The problems encountered with gearboxes and the use of turboshaft engines are examined. A comparison of turboprop and turbofan engines is presented. The development and testing of a propfan engine, which is a turbofan engine that can achieve a higher turbine operating temperature, are described. I.F.

**A STUDY OF THE SWIRLING OF A LIQUID BY POROUS ROTORS [ISSLEDOVANIE ZAKRUTKI ZHIDKOSTI PORISTYMI KOLESAMI]**
IU. V. DRONOV, A. A. PANCHENKO, and V. F. PRISNIAKOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 25-28. In Russian.

The swirling of a liquid by the porous rotors of centrifugal pumps is investigated experimentally as a function of the inlet diameter and of the porosity factor. An empirical expression for estimating the swirling of a liquid at the outlet side of the rotor is obtained. Experimental results are presented for water. V.L.

**A86-12541**
**A METHOD FOR DESIGNING A SURGE PROTECTION DEVICE FOR GAS TURBINE ENGINES [OB ODNOM SPOSOBE POSTROENIIA USTROISTVA ZASHCHITY GTD OT POMPAZHA]**
M. M. SHAKIRIANOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 64-68. In Russian. refs

The possibility of recognizing the unstable operation of an aircraft engine using the Van der Pol equation is investigated. The conditions defining the gasdynamic stability region of a gas-turbine engine are then obtained and implemented in an automatic surge protection system. The general design and the principle of operation of the system are described. V.L.

**A86-12544**

**A STUDY OF THE EFFECT OF ROTOR BLADING PARAMETERS ON THE REGION OF ACCEPTABLE DESIGN SOLUTIONS FOR THE ATTACHMENT OF AIRCRAFT COMPRESSOR BLADES [ISSLEDOVANIE VLIIANIIA PARAMETROV PROTOCHNOI CHASTI KOLESA NA OBLAST' DOPUSTIMYKH PROEKTNYKH RESHENII PO UZLAM KREPLENIIA LOPATOK AVIATSIONNYKH KOMPRESSOROV]**

B. M. ARONOV and V. A. KAMYNIN Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 75-77. In Russian.

In order to assess the possibility of using particular types of blade-root fastenings at an early stage of design, the knowledge of the effect of rotor blading parameters on the region of acceptable design solutions for the fastenings is required. Here, the relationship between the parameters of the rotor blading and the region of acceptable design solutions is analyzed using a full factorial experimental design. Results are presented for blades and a rotor made of VT-9 alloy. V.L.

**A86-12546**

**DETERMINATION OF THE THRUST OF A BYPASS ENGINE UNDER OPERATING CONDITIONS [OPREDELENIE TIAGI TRDD V USLOVIIAKH EKSPLUATATSII]**

A. D. KOZITSKII and V. T. SHEPEL Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 79-81. In Russian.

A method for determining the thrust of a bypass engine is proposed which uses as the initial data the rotor rpm and fuel consumption, i.e., parameters that can be easily measured during the operation of the engine, rather than the full gas pressure behind the turbine. The method is simple to implement and sufficiently accurate. For a plus or minus 2-sigma variance, the maximum relative error of thrust determinations is plus or minus 1.7 percent; with a correction for the individual compressor output, the maximum relative error is reduced to plus or minus 1.2 percent. V.L.

**A86-12548**

**A STUDY OF A TURBINE STAGE WITH A TWISTED VANED DIFFUSER [ISSLEDOVANIE TURBINNOI STUPENI S ZAKRUCHENNYM LOPATOCHNYM DIFFUZOROM]**

S. M. LANGOVOI and IU. I. MITIUSHKIN Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 83-85. In Russian. refs

Tests have been carried out on a turbine stage with cylindrical blading to determine the effect of a twisted vaned diffuser on the turbine performance. It is shown that a diffuser with twisted vanes reduces the maximum efficiency of the turbine stage by about 0.6 percent, while significantly decreasing the optimum value of the velocity characteristic (from 0.625 to 0.54). It is also shown that the use of a twisted vaned diffuser has little effect on the thrust characteristics and improves the economy of the turbine stage by approximately 1 percent in the velocity characteristic range 0.43-0.53. V.L.

**A86-12549**

**UNSTEADY OPERATION OF THE FUEL NOZZLES OF THE MAIN COMBUSTION CHAMBER OF A GAS-TURBINE ENGINE [O NESTATSIONARNOI RABOTE TOPLIVNYKH FORSUNOK OSNOVNOI KAMERY SGORANIIA GTD]**

E. IU. MARCHUKOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 86-88. In Russian. refs

The mechanisms of acoustic wave generation in the centrifugal fuel nozzles of the combustion chamber of a gas-turbine engine are investigated experimentally and found to be of hydrodynamic nature. In particular, the phenomenon of self-oscillatory flow in centrifugal fuel nozzles with nonsubmerged outflow is identified. The unsteady operation of fuel nozzles significantly intensifies mixing processes but, at the same time, can lead to combustion instability in the combustion chamber. The need for further studies of the phenomenon described here is emphasized. V.L.

**A86-12555**

**HIGH-SPEED LASER PHOTORECORDING OF A FUEL NOZZLE JET [LAZERNAIA SKOROSTNAIA FOTOREGISTRATSIIA FAKELA FORSUNKI]**

V. P. SHORIN, O. A. ZHURAVLEV, L. N. MEDINSKAIA, A. G. OSADCHUK, and V. V. TOKAREV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 100-102. In Russian. refs

The existing methods of monitoring the structure of a fuel jet injected into the combustion chamber of a gas-turbine engine are briefly reviewed, and the advantages of high-speed laser photorecording (the laser knife method) are examined. This method makes it possible to visualize the structure of the jet and to determine the velocity distributions of gas flow by injecting monodisperse particles with specified optical properties. Experimental results for a fuel jet injected by a pneumatic nozzle are presented which show that reliable recording of the jet structure is achieved with an energy density in the laser knife of 250 J/sq m, which can be provided by an unamplified ruby laser. V.L.

**A86-12599**

**ASSURING THE RELIABILITY OF AIRCRAFT ENGINES [OBESPECHENIE NADEZHNOSTI AVIATSIONNYKH DVIGATELEI]**

N. D. KUZNETSOV Akademiia Nauk SSSR, Vestnik (ISSN 0002-3442), no. 8, 1985, p. 85-92. In Russian.

The problem of the reliability of aircraft engines is examined with emphasis on the methodology of optimum design. In particular, attention is given to the optimization of the initial factors and principal gasdynamic parameters, mathematical description of physical processes occurring in gas turbines, and the role of computers in optimum design. The discussion also covers special tests for gas-turbine engines, the effect of process variables on the fatigue behavior of turbine blades, surface treatment techniques for hardening gas-turbine components, and new engine diagnostic methods and equipment. V.L.

**A REVIEW OF ADVANCED TURBOPROP TRANSPORT ACTIVITIES**

R. H. LANGE *In* AGARD Aerodyn. and Acoustics of Propellers 16 p Feb. 1985 refs

Avail: NTIS HC A20/MF A01

The application of advanced technologies shows the potential for significant improvement in the fuel efficiency and operating costs of future transport aircraft envisioned for operation in the 1990s time period. One advanced turboprop concept originated by Hamilton Standard and NASA is known as the propfan. The concept features a highly loaded, multibladed, variable pitch propeller geared to a high pressure ratio gas turbine engine. The blades have high sweepback and advanced airfoil sections to achieve 80 percent propulsive efficiency at M = 0.80 cruise speed. Aircraft system studies have shown improvements in fuel efficiency of 15 to 20 percent for propfan advanced transport aircraft as compared to equivalent turbofan transports. Beginning with the Lockheed C-130 and Electra turboprop aircraft, an overview of the evolution of propfan aircraft design concepts and system studies is presented. These system studies include possible civil and military transport applications and data on the performance, community and far field noise characteristics and operating costs of propfan aircraft design concepts. NASA Aircraft Energy Efficiency (ACEE) program propfan projects with industry are reviewed with respect to system studies of propfan aircraft and recommended flight development programs. Author

**AERODYNAMIC METHOD USED IN FRANCE FOR ADVANCED FAST PROPELLER STUDY**

J. M. BOUSQUET *In* AGARD Aerodyn. and Acoustics of Propellers 15 p Feb. 1985 refs In FRENCH; ENGLISH summary Original language document previously announced in IAA as A85-15840

Avail: NTIS HC A20/MF A01

Computational techniques and programs currently in use in the design analysis of aircraft propellers are surveyed and illustrated with diagrams and graphs of typical results. Methods examined include lifting line, incompressible lifting surface, three dimensional compressible, and three dimensional Euler; both classical and advanced propeller designs are considered. The Euler analysis of the experimental propeller HT1 being developed for ONERA is explored in detail, evaluating the effects of tip speed ratio, Mach number, number of blades, hub diameter, and a tapered diameter hub shroud. T.K.

**DESIGN CONCEPT AND PERFORMANCE PREDICTION TECHNIQUE FOR POTENTIAL FLOWS AROUND ADVANCED PROPELLERS**

T. S. LUU and R. COLLERCANDY *In* AGARD Aerodyn. and Acoustics of Propellers 12 p Feb. 1985 refs

Avail: NTIS HC A20/MF A01

The design concept and performance prediction technique for potential flows around advanced propellers is presented. The design of propellers is based on the panel method, applied to the lifting surface theory in which the flow is supposed to be incompressible. A transonic performance prediction technique is developed where the resulting potential equation is solved by a finite difference approximate factorization method in a body fitted grid system. Both two and three dimensional results are presented. Author

**N86-11151#** Aircraft Research Association Ltd., Bedford (England).

**A REVIEW OF ARA RESEARCH INTO PROPELLER AERODYNAMIC PREDICTION METHODS**

A. J. BOCCI and J. I. MORRISON *In* AGARD Aerodyn. and Acoustics of Propellers 19 p Feb. 1985 refs

Avail: NTIS HC A20/MF A01

An improved wake method involving a numerical solution to Goldstein's wake flow model was developed and the effects of removing Goldstein's limiting assumptions are illustrated. The representation of ARA-D airfoil data for use with the wake methods is considered, covering the wide range of geometry and flow conditions likely to be encountered on operating blades. The importance of finite blade effects is discussed and a tip relief correction is shown to improve predictions of experimental blade pressures and loadings. A method was developed to calculate the flow induced by a prescribed wake vortex sheet and some of the issues arising in calculating the flow development from the propeller disc downstream are illustrated. A three dimensional method involving solution of the compressible potential flow equation was developed, capable of predicting the blade flow in some detail for general multiblade configurations. Comparisons with experiment are shown for two blade cases. Author

**MODERN PROPELLER PROFILES**

A. M. RODDE, J. J. CUNY (Societe Ratier Figeac, France), and J. J. THIBERT *In* AGARD Aerodyn. and Acoustics of Propellers 12 p Feb. 1985 refs In FRENCH Original language document previously announced in IAA as A85-15841

Avail: NTIS HC A20/MF A01

The design of a family of advanced profile composite aircraft propellers is presented, and the results of wind tunnel tests performed at the ONERA Modane S3 and CEATY S10 facilities are reported. The design specifications are outlined; the definition of profiles with relative thicknesses 4, 7, 12, and 20 percent is explained; and the test results are presented in graphs and diagrams. Significant performance improvements (relative to a NACA 16707 reference profile) are observed, including 43 and 8 percent better lift/drag ratios for cruising and ascent, respectively, 15 percent better Cz max, and equivalent critical Mach number at lower drag. The first planned application is to the Transall C160 two engine turboprop transport aircraft. T.K.

**AERODYNAMICS OF WIDE-CHORD PROPELLERS IN NON-AXISYMMETRIC FLOW**

J. B. H. M. SCHULTEN *In* AGARD Aerodyn. and Acoustics of Propellers 10 p Feb. 1985 refs

Avail: NTIS HC A20/MF A01

A lifting surface analysis is presented for propellers in nonaxisymmetric flow. In the analysis the Euler equations linearized about a uniform subsonic main flow are solved after separation of variables in cylindrical coordinates. This solution is obtained via an integral equation for the force distribution over the upper and lower surfaces of the blades which replaces the action of the propeller on the surrounding fluid. The boundary condition of vanishing normal velocity is applied at the actual blade surfaces, thus leading to a nonhelicoidal, unsteady lifting surface theory for propellers. Since the integral equation is solved most efficiently per circumferential Fourier component of the inflow distortion field, symmetric inflow is included naturally as the zeroth term of the Fourier series. General blade shapes can be handled as the blades may be swept both axially and azimuthally. There is no inherent limitation to the propeller tip Mach number. Apart from the calculation of the unsteady blade loading, expressions for the velocity and pressure fields are derived, in which the propeller slipstream appears explicitly as part of the complete velocity field in a form perfectly suited for wing interference calculations. Author

**N86-11154#** Cranfield Inst. of Tech., Bedford (England). Coll. of Aeronautics.

**ON THE AERODYNAMICS OF INSTALLED PROPELLERS**

M. E. ESHELBY *In* AGARD Aerodyn. and Acoustics of Propellers 15 p Feb. 1985 refs

Avail: NTIS HC A20/MF A01

When the propeller is installed on the aircraft there will be mutual influence between the airframe and the propeller and its slipstream, two sources of that interference are examined. First, as the aircraft angle of attack changes with forward speed the angle of attack of the propeller also changes giving rise to forces and moments other than thrust and torque. Second, the high energy slipstream may pass over the tailplane and so affect the tail lift force, and in consequence a pitching moment due to power may be produced. These two effects are considered separately and means are suggested to estimate their magnitude and their effect on the handling qualities of the aircraft. Author

**A UNIFIED APPROACH FOR THE AERODYNAMICS AND ACOUSTICS OF PROPELLERS IN FORWARD MOTION**

A. DAS *In* AGARD Aerodyn. and Acoustics of Propellers 28 p Feb. 1985 refs

Avail: NTIS HC A20/MF A01

The aerodynamics and the acoustics of moving bodies or surfaces follow the same basic laws of disturbance propagation and hence can be treated in a unified way. Further advancements of the propeller theories have two objectives: attaining better propulsive efficiency and producing less noise at high forward speeds. A unified aerodynamic and acoustic theory of propeller in forward motion is formulated and analyzed in detail describing the aspect of disturbance propagation from singularities in arbitrary motion, derivation of the spatial and temporal dilatations concerned with the propagation process, generalized exposition of the solution method for aerodynamics and acoustics and an extended sweep technique to determine the inducing effect of moving surfaces. In view of the flow field of a propeller being not completely irrotational the use of pressure potential proves to be more suitable in the numerical methods. The results of the analysis are illustrated by diagrams. Author

**THEORETICAL ANALYSIS OF LINEARIZED ACOUSTICS AND AERODYNAMICS OF ADVANCED SUPERSONIC PROPELLERS**
F. FARASSAT *In* AGARD Aerodyn. and Acoustics of Propellers 15 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01 CSCL 01A

The derivation of a formula for prediction of the noise of supersonic propellers using time domain analysis is presented. This formula is a solution of the Ffowcs Williams-Hawkings equation and does not have the Doppler singularity of some other formulations. The result presented involves some surface integrals over the blade and line integrals over the leading and trailing edges. The blade geometry, motion and surface pressure are needed for noise calculation. To obtain the blade surface pressure, the observer is moved onto the blade surface and a linear singular integral equation is derived which can be solved numerically. Two examples of acoustic calculations using a computer program are currently under development. Author

**A GENERAL THEORY OF ARBITRARY MOTION AERODYNAMICS USING AN AEROACOUSTIC APPROACH**
L. N. LONG and G. A. WATTS *In* AGARD Aerodyn. and Acoustics of Propellers 12 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01

The theoretical aspects of a new unsteady aerodynamics method that uses time domain aeroacoustic integral equations is described. Recent advances in theoretical aeroacoustics permit the development of general unsteady aerodynamics methods. The effects of thickness, compressibility, and arbitrary motions may be calculated for subsonic and supersonic flows. Most linearized unsteady aerodynamics methods today are limited to zero thickness effects and sinusoidal motion. The equations presented will make it possible to develop computer codes for complex three dimensional bodies, including not only complete aircraft configurations, but rotating propellers and helicopter blades as well. Panel methods for steady aerodynamics are widely used in the aircraft industry for such configurations, the present method should permit equally general configurations to be solved in unsteady motion, using a time stepping procedure. Advanced high speed propellers offer large performance improvements for aircraft that cruise in the Mach 0.7 to 0.8 speed regime. At these speeds, studies indicate that there is a 15 to near 40 percent block fuel savings and associated operating cost benefits for advanced turboprops compared to equivalent technology turbofan powered aircraft. Recent wind tunnel results for five eight to ten blade advanced models are compared with analytical predictions. Test results show that blade sweep was important in achieving net efficiencies near 80 percent at Mach 0.8 and reducing nearfield cruise noise about 6 dB. Lifting line and lifting surface aerodynamic analysis codes are under development and some results are compared with propeller force and probe data. Also, analytical predictions are compared with some initial laser velocimeter measurements of the flow field velocities of an eight bladed 45 swept propeller. Experimental aeroelastic results indicate that cascade effects and blade sweep strongly affect propeller aeroelastic characteristics. Comparisons of propeller nearfield noise data with linear acoustic theory indicate that the theory adequately predicts nearfield noise for subsonic tip speeds, but overpredicts the noise for supersonic tip speeds. **DYNAMIC BEHAVIOR OF A PROPFAN**
J. M. BESSON and D. PETOT (ONERA, Paris) *In* AGARD Aerodyn. and Acoustics of Propellers 15 p Feb. 1985 refs In FRENCH Original language document previously announced in IAA as A85-15842
Avail: NTIS HC A20/MF A01

The dynamic behavior of a 1 m diameter 12 blade propfan model is investigated analytically and experimentally. Both the propfan and its individual blades are analyzed using two versions of a simplified beam model and the finite element codes ASTRONEFF and SAMCEF, considering blades of Dural alloy, CFRF, and foam filled CFRP. The modeling techniques are illustrated, and results are presented in graphs and tables. The single blade findings are compared with the results of wind tunnel tests performed at the ONERA Mondane S1 facility, and the errors of the models are found to be of the order 10 percent. The ASTRONEFF procedure is shown to be best adapted to the foam filled ribbed CFRP blade to be used in the actual propfan model. Preliminary computations of the aerodynamics and static deformation of the propfan are also presented. T.K.

**PERFORMANCE EVALUATION OF FULL SCALE PROPELLERS BY WIND TUNNEL TEST**
D. J. BARBER *In* AGARD Aerodyn. and Acoustics of Propellers 12 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01

A large propeller test facility was developed for the nine meter wind tunnel. The facility is described along with the propeller test rig features and associated drive system. Propeller performance measurement philosophy, test procedures and calibrations are discussed. In cooperation with Dowty Rotol Ltd. and Hartzell Inc., two currently available propeller designs were tested. The two 8.5 foot diameter propeller suitable for a DHC Twin Otter size of aircraft provided an evaluation of alternative airfoil applications: the ARA-D series and NACA 16 series. Results have demonstrated propeller efficiencies close to manufacturers estimates for clean well finished blades. Forward and reverse thrust testing results are discussed with respect to aircraft application. Prediction methods tend to over estimate efficiencies due to hardware features encompassing blade finish, blade root/spinner juncture, spinner openings, erosion protection and deicer equipment. Typical results illustrating the influence on propeller performance of such features is given. Author

D. FAVIER and C. MARESCA *In* AGARD Aerodyn. and Acoustics of Propellers 22 p Feb. 1985 refs In FRENCH
Avail: NTIS HC A20/MF A01

An analysis of the near and far wake of a four blade aerial propeller, operated under various working parameters and following various adjustments, was carried out with hot wire anemometry. Empirical laws were synthesized which provide the axial translation velocity of the tip vortices, the rate of wake radial contraction, in such a way that the stability limit of the vortex system is established as a function of azimuth rotation and as an extended range of the working parameters active in the range from null to maximum thrust. For a given functional regime, the determination of the three dimensional induced velocity field is effective in different sections downstream of the wake and conducted in a detailed characterization of the geometry and associated vortex intensity, in the azimuth function and the axial distance to the downstream of the plane of rotation. Avail: NTIS HC A20/MF A01

After a period of stagnation in the years following WW2 an accelerated movement towards propeller propulsion has taken place in recent years. Because of its inherent propulsive advantages the propeller propulsion has a considerable development potential. Initial analyses of the state of the art of propeller technology in the General Aviation field by means of flight and wind tunnel tests as well as by aerodynamic and acoustic calculations have shown possibilities for improvement, mainly in the lower and medium speed range. Improved propellers were designed and analyzed theoretically and experimentally. Newly designed supercritical airfoils with high lift to drag ratios at high lift were used. To find the optimum blade shapes associated with minimum supervelocities, also several tip shapes were analyzed. After wind tunnel tests the best of the propeller designs was selected for full scale flight test. A set of experimental propellers for the Do 228 Experimental aircraft was developed, constructed and tested. Improvements were achieved in the whole flight regime. The experience of this propeller development program was used to design a high performance high speed General Aviation propeller for M = 0.6 flight. Author

**AERODYNAMIC AND STRUCTURAL ASPECTS OF PROPELLER AND DRIVE FOR A 1/5 SCALE WIND TUNNEL PROGRAMME**
R. M. BASS, B. MUNNIKSMA (National Aerospace Lab., Amsterdam), and J. VANHENGST (Royal Netherlands Aircraft Factories Fokker, Schiphol-Oost) *In* AGARD Aerodyn. and Acoustics of Propellers 18 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01

The paper describes the development of a model propeller and its calibration in association with an axisymmetric nacelle in the National Aerospace Laboratory low speed tunnel in Amsterdam before testing on a complete 1/5 scale model of the Fokker in the DNW (German-Dutch wind tunnel). The calibration so obtained, allowed the required operating propeller conditions to be set up on the complete F50 model. The influence of Reynolds number on correction for scale effects, between experimental model results and full scale prediction. A previously unsuspected and unavoidable vibration originating in the reduction gear train of the drive unit gave rise to high propeller blade stresses, ultimately leading to a blade failure. In order to continue running with minimum delay, new propeller blades with high internal damping were manufactured from composite materials, and the program was successfully concluded. Author

Avail: NTIS HC A20/MF A01

This report presents studies conducted on the integration of aircraft propellers with the airframe for general aircraft, as well as for high performance twin engine propeller aircraft. The effect of engine dimensions on the aerodynamic characteristics of the aircraft in all flight situations, including low speed flight, is presented. It is shown that detailed model tests will have to be conducted before accurate results can be obtained. The objective of these studies is to examine possible configurations for future maritime reconnaissance twin engine propeller aircraft. T.M.

**WIND TUNNEL INVESTIGATION OF THE INTERACTION OF PROPELLER SLIPSTREAM WITH NACELLE/WING/FLAP COMBINATIONS**
A. S. ALJABRI and A. C. HUGHES *In* AGARD Aerodyn. and Acoustics of Propellers 10 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01

Until recently it was sufficient to define the propeller slipstream by the average velocity induced across the propeller disk. With the advent of the highly loaded program and the accompanying concern for the effect of the slipstream and its interaction with aircraft components be known. This paper describes a series of wind tunnel tests performed to improve the understanding of this complex aerodynamic interaction. The tests were conducted using a conventional propeller operating at low subsonic speeds. Complementary theoretical and experimental studies were used to investigate the interaction effects. Results from wind tunnel tests on propeller/nacelle/wing, and propeller/nacelle/wing/flap combinations are presented here. Force, pressure, and wake survey data from the test allow the slipstream characteristics, including its distortion by the wing and flap, to be obtained. The important parameters which govern the slipstream shape and induced velocities are identified and techniques are developed for estimating slipstream drag and the torque absorbed by a wing immersed in the slipstream. An improved understanding of the effects of wind tunnel walls on propeller powered testing is also presented. Author

**AN ASYMPTOTIC THEORY FOR THE INTERFERENCE OF LARGE ASPECT RATIO SWEPT WINGS AND MULTIPLE PROPELLER SLIPSTREAMS**
R. K. PRABHU (Old Dominion Univ.), C. H. LIU, and S. N. TIWARI (Old Dominion Univ.) *In* AGARD Aerodyn. and Acoustics of Propellers 17 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01 CSCL 01A

This paper presents an asymptotic method for the analysis of the interference of multiple tractor propeller slipstream with large aspect ratio swept wings. It is assumed that the height of the slipstream is of the order of the wing chord and its spanwise extent is of the order of the wing span. Three different flow regions are identified by employing different stretching transformations. Asymptotic expansions are made in each of the three regions, using the chord to span ratio as the small expansion parameter. The details of the nonuniform flow in the slipstream enter into the wing sectional analysis. In the outer limit, the wing shrinks to a swept lifting line, and the slipstream reduces to a thin sheet of jet carrying the momentum gain from the propeller. The curvature of this jet sheet results in a pressure difference which is represented by a vortex sheet. The governing equations are solved by discretization. Several examples are considered for which experimental data are available. Comparison of the present results with the experimental data as well as other numerical solutions showed generally good agreement. Author

**DEVELOPMENT OF MODERN TURBOPROP ENGINES**
H. I. H. SARAVANAMUTTOO *In* AGARD Aerodyn. and Acoustics of Propellers 9 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01

Proposals for propfan commercial aircraft operating at high cruise speeds pose requirements for advanced turboprops of high power. The history of turboprops for long range operation is briefly reviewed and the requirements for future engines are discussed. Considerable gains in the thermodynamic cycle can be realized, and the development of high performance gas generators should be a straightforward process. Transmission designs for high power engines may be extremely difficult and may result in novel engine configurations. It appears likely that a more modest goal of M = 0.7 cruise for shorter haul aircraft could be attained with much less risk while still achieving major gains. Author

Aeroacoustic experiments using the full scale propeller nacelle rig in the 24 ft anechoic tunnel were first made in 1979/80 on three alternative propellers also tested in flight on the Short's 330 aircraft. The Hartzell five bladed propeller of the production aircraft has conventional NACA 64 series sections and standard tips, the Hartzell Q-tip version of this has its tips bent as lower surface end plates in the direction of rotation, and the Dowty four bladed propeller has modern ARA-D sections and standard tips (D sub p = 2.8 m). Later complementary tunnel/flight experiments also included the Dowty four bladed R.212 propeller with classical NACA 16 series sections as fitted to the B.Ae. HS 748 aircraft (D sub p = 3.7 m). **COMBUSTION HOT SECTION TECHNOLOGY**
D. B. ERCEGOVIC *In its* Turbine Eng. Hot Sect. Technol. (HOST) p 129-133 Oct. 1983 refs
Avail: NTIS HC A11/MF A01 CSCL 21E

The overall objective of the Turbine Engine Hot Section Technology Combustion Project is to develop and verify improved and more accurate analysis methods for increasing the ability to design with confidence the combustion system for advanced aircraft turbine engines. The analysis methods developed will be generically applicable to combustion systems and not restricted to one specific engine or manufacturer. This project's approach was to first assess and evaluate existing combustor aerothermal analysis models by means of a contracted effort initiated during FY 1982. This evaluation effort has assessed and quantified known models' strengths and deficiencies. During FY 1984 the Aerothermal Modeling Program, Phase 2 will be initiated, which is expected to have contracted model development efforts in the areas of improved numerical methods for turbulent viscous flows, flow interactions, and fuel spray flow foekd interactions. A Phase 3 effort is planned to address remaining model deficiencies. The primary inhouse effort in this area will be the determination of high pressure flame radiation characteristics in a full annular combustor. This experiment will be conducted in the NASA LeRC High Pressure Facility with the results compiled into a comprehensive flame radiation and liner heat flux model. Author

R. H. JOHNS *In its* Turbine Eng. Hot Sect. Technol. (HOST) p 153-158 Oct. 1983
Avail: NTIS HC A11/MF A01 CSCL 21E

Hot section components of aircraft gas turbine engines are subjected to severe thermal structural loading conditions, especially during the start up and take off portions of the engine cycle. The most severe and damaging stresses and strains are those induced by the steep thermal gradients induced during the start up transient. These transient stresses and strains are also the most difficult to predict, in part because of the temperature gradients and distributions are not well known or readily predictable, and also because the cyclic elastic viscoplastic behavior of the materials at these extremes of temperature and strain are not well known or readily predictable. A broad spectrum of structures related technology programs is underway to address these deficiencies. One element of the structures program is developing improved time varying thermal mechanical load models for the entire engine mission cycle from start up to shutdown. Another major part of the program is the development of new and improved nonlinear 3-D finite elements and associated structural analysis programs, including the development of temporal elements with time dependent properties to account for creep effects in the materials and components. Avail: NTIS HC A11/MF A01 CSCL 21E

The overall objective of this program is to develop and verify a series of interdisciplinary modeling and analysis techniques which have been specialized to address three specific hot section components. These techniques will incorporate data as well as theoretical methods from many diverse areas, including cycle and performance analysis, heat transfer analysis, linear and nonlinear stress analysis, and mission analysis. Building on the proven techniques already available in these fields, the new methods developed through this contract will be integrated to provide an accurate, efficient, and unified approach to analyzing combustor burner liners, hollow air cooled turbine blades, and air cooled turbine vanes. For these components, the methods developed will predict temperature, deformation, stress, and strain histories throughout a complete flight mission. Author

**AN ANALYSIS OF TWO METHODS FOR ANALYSIS OF DYNAMIC FLIGHT TEST MANOEUVRES**
M. H. VERHAEGEN and J. VANDEWALLE (Leuven, Katholieke Universiteit, Heverlee, Belgium) International Journal of Modelling and Simulation (ISSN 0228-6203), vol. 5, no. 3, 1985, p. 94-99. Research supported by the Instituut tot Aanmoediging van het Wetenschappelijk Onderzoek in Nijverheid en Landbouw. refs

New, reliable flight test instrumentation systems and accurate data analysis methods are needed for the conduction of dynamic flight tests. The present study is concerned with the required data analysis methods, taking into account problems related to the

reconstruction of the aircraft motion (state), and to aircraft system model identification. Attention is given to two different methods for solving these problems in the case of linear aircraft model structures. The first method, referred to as the 'one-step method', is based on postflight data analysis. The second method relies on accurate measurements of specific aerodynamic forces and moments. Using the measurements of these aerodynamic quantities, the state of the aircraft is obtained on the basis of the solution of linear equations. The reconstructed state is used in a second step, involving the aerodynamic model identification.

### DIGITAL FLIGHT CONTROL SYSTEMS FOR UMA

D. J. DYER (Cranfield Institute of Technology, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 25.1-25.9. Research supported by the Ministry of Defence (Procurement Executive).

The evolution of two microprocessor-based flight control systems for unmanned aircraft (UMA), the MACHAN, and the CRANFIELD Digital Flight Control System (DFCS) is described. The design goals for both systems are discussed in connection with the operating environment of next generation UMAs. Consideration is given to durability in the presence of EMI; versatility; and low-weight for maximum endurance. The CRANFIELD DFCS is currently under development for a next generation UMA system having applications in the fields of battlefield surveillance; weapons delivery; and target drones. The estimated volume, weight, and power consumption of the DFCS were 1/3 lower in comparison with the MACHAN system. A schematic diagram of the DFCS control loop is provided. I.H.

### MODELING VEHICLE DYNAMICS FOR FLYING QUALITIES STUDIES

H. T. BREUL, T. L. KELLER, and R. C. WESTON (Grumman Corp., Bethpage, NY) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 11 p.
(AIAA PAPER 85-3062)

A convolution and superposition approach is described for defining numerical models for examining modern aircraft flying quality problems. The simulations are limited to small variations in speed and attitude about fixed, trimmed flight conditions. A main research goal is to evaluate pilot acceptance of control system performance in reference flight conditions. Linear models are used for the vehicle/system dynamics, yielding geometric outputs for the time responses to a unit step input of pilot control. The resulting motion signatures provide graphic data on the motion a pilot experiences in response to control actions. Convolution and superposition mathematical techniques form the bases for the CONVO code for the control qualities simulation-based research, which is illustrated by assessing the adverse lateral control responses of a hovering VTOL aircraft. M.S.K.

### DIGITAL FLIGHT CONTROL OF LONGITUDINALLY UNSTABLE AIRCRAFT

A. BRADSHAW, A. T. DAVIS, and M. A. WOODHEAD (Salford, University, England) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 8 p. refs
(AIAA PAPER 85-3088)

A numerical examination is made of the effects of a gradual relaxation of stability of a YF-16 aircraft from an s-plane pole value of +1.18 at Mach 0.6 at sea level to a value of +5.0. The study is carried out in terms of the frequency response and root locus characteristics to which flight control systems must be retuned to maintain adequate response characteristics in unstable flight. Comparisons are made with the AFTI/F-16 response at Mach 0.6 at 3000 ft altitude, wherein the unstable pole has a value of +5.45. The results indicate that a single-input, pitch-rate controller will not be able to maintain longitudinal stability using current technologies. A faster iteration rate and a concomitant increase in the on-board processing power will ameliorate some of the control problems.

### ADAM - AN AEROSERVOELASTIC ANALYSIS METHOD FOR ANALOG OR DIGITAL SYSTEMS

T. NOLL, M. BLAIR, and J. CERRA (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. refs
(AIAA PAPER 85-3090)

Coupling of the elastic modes and the high-gain automatic flight control systems of the aircraft can result in unstable interactions within the flight envelope. These instabilities are any undamped structural oscillations sensed by the flight controller and driven by the control surface motions. This paper highlights the activities pursued by the Flight Dynamics Laboratory (FDL) in developing analysis tools for performing independent audits of proposed flight systems and for conducting research in the area of aeroservoelasticity (ASE). ADAM (Analog and Digital Aeroservoelasticity Method) combines the technologies of unsteady aerodynamics, multiinput/multioutput (MIMO) controls and structural dynamics into an interactive analysis package. The governing equations and the results of several examples that were used to verify the credibility of ADAM are discussed in the paper. Lessons learned are included to help engineers avoid the unexpected.

**FAULT EFFECT PROTECTION AND PARTITIONING FOR FLY-BY-WIRE/FLY-BY-LIGHT AVIONICS SYSTEMS**

L. J. YOUNT, K. A. LIEBEL, and B. H. HILL (Sperry Corp., Commercial Flight Systems Div., Phoenix, AZ) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 275-284. refs
(AIAA PAPER 85-6002)

This paper discusses the special problems involved in developing full-time critical, (i.e., fly-by-wire/fly-by-light) fully digital, control systems for commercial transport aircraft. The starting point will be a discussion of critical (Category III) automatic landing systems, beginning with early, fully analog implementations and continuing through to current digital implementations, some of which are capable of tolerating generic software errors. Fault effects partitioning for both hardware and software will be discussed relative to perceived need, and several available techniques will be described. The emphasis of this paper will be an architectural solution to safety validation problems. The specific limitations of analysis-dependent validation techniques, such as RTCA/DO-178, will be discussed. Special emphasis will be given to extensive generic fault protection for fly-by-wire/fly-by-light systems through the use of fault-tolerance mechanisms including 'multi-version software'. Author

**QUASI-OPTIMAL ON-LINE GUIDANCE LAWS FOR MILITARY AIRCRAFT**

H. T. HUYNH and O. MOREIGNE (ONERA, Chatillon-sous-Bagneux, France) ONERA, TP, no. 1985-91, 1985, 13 p. refs
(AIAA PAPER 85-1977; ONERA, TP NO. 1985-91)

Quasi-optimal guidance laws for on-board computation application have been developed for minimum-time to climb and intercept manoeuvers in the vertical plane. The technique used is derived from singular perturbation theory with a realistic times scale decomposition of the aircraft dynamics. The control laws obtained are of closed-loop type, and can fulfill terminal constraints on altitude and or flight path angle. The validity is extended to a large flight envelope by taking into account an intermediate boundary layer in order to eliminate the altitude-jump in energy-climb profile. These control laws are further corrected by a pseudo-first order asymptotic expansion and are compared in numerical simulations with the exact open loop solutions given by a projected gradient numerical algorithm. A better than 1 percent accuracy is obtained for the performance index. The computation time of these quasi-optimal laws is very small, and is compatible with real-time on-board computer applications. Author

**DETERMINATION OF THE ORDER AND STRUCTURE OF THE LINEAR DIFFERENTIAL EQUATIONS OF AIRCRAFT MOTION FROM EXPERIMENTAL RESULTS [OPREDELENIE PORIADKA I STRUKTURY LINEINYKH DIFFERENTSIAL'NYKH URAVNENII DVIZHENIIA SAMOLETA PO REZUL'TATAM EKSPERIMENTA]**

V. A. LEONOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 38-42. In Russian.

Decision rules for estimating the order and structure of a linear differential equation describing experimental results are obtained by using the Bayes approach. The decision rules for estimating the order of the 'inputs' and 'outputs' of a system are related to the Akaike criterion. It is also noted that the decision rules obtained can be extended to the case of the r-dimensional vector 'input'. V.L.

**THE PROBLEM OF DETERMINING THE OPTIMUM PARAMETERS OF AN AUTOPILOT [K ZADACHE OPREDELENIIA OPTIMAL'NYKH PARAMETROV AVTOPILOTA]**

L. G. ROMANENKO Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 56-60. In Russian. refs

The optimum parameters of an autopilot can be effectively determined by using the standard forms of characteristic polynomials. Here, algorithms are developed for determining the coefficients of characteristic polynomials corresponding to minimum integral quadratic estimates. The use of the results obtained for calculating the parameters of an autopilot is illustrated by an example. V.L.

**THE PROBLEM OF SELECTING THE PARAMETERS OF A FLIGHT VEHICLE ON THE BASIS OF THE MOTION STABILITY REQUIREMENT [K VOPROSU VYBORA PARAMETROV LETATEL'NOGO APPARATA IZ USLOVIIA OBESPECHENIIA USTOICHIVOSTI EGO DVIZHENIIA]**

T. K. SIRAZETDINOV and N. R. SURKIN Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 61-64. In Russian. refs

The problem of selecting the parameters of a flight vehicle on the basis of the motion stability requirement is analyzed for the case where the flight vehicle motion is described by a system of linear differential equations with variable coefficients. The problem is treated as the main control problem, and a solution is obtained using the method of Liapunov functions. V.L.

**MODELING OF THE VARIABLE FRONTAL STIFFNESS OF THE RUDDER OF A DYNAMICALLY SIMILAR EMPENNAGE MODEL [MODELIROVANIE PEREMENNOI LOBOVOI ZHESTKOSTI RULIA DINAMICHESKI PODOBNOI MODELI OPERENIIA]**

A. V. STARIKOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 2, 1985, p. 94, 95. In Russian.

The use of a three-dimensional deformation model in solving the problem of the flexure-rudder flutter of the empennage has shown that the critical velocity depends to a large extent on the stiffness of the rudder in the chord (frontal) plane. Here, a method is described for modeling the variable frontal stiffness of a rudder in order to determine its effect on the dynamic stability of an empennage model. The method consists in fabricating a series of rudder spars for a dynamically similar empennage model and investigating the effect of the frontal stiffness of the rudder on the critical flutter parameters. V.L.

**CONTROL CONCEPTS FOR IN-FLIGHT SIMULATION INCLUDING ACTUATOR NONLINEARITIES AND TIME DELAYS**

F. HENSCHEL Mar. 1985 69 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-948)
(DFVLR-FB-85-24; ISSN-0171-1342) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 23.50

A model-following system was developed to study the dynamic behavior of transport aircraft with reduced longitudinal stability. The system is divided into two parts. The first consists of feedforward branches. If a linear description of the model and the basic aircraft is assumed an exact model-following is achieved by this part. For the control matrices algebraic expressions are derived. In the equations the influence of actuator dynamics is considered. A set of formulas in which all variables are assumed to be discretized for processing on a digital computer is developed. By the second subsystem an error suppression is achieved. The application of a cost vector method is demonstrated for one example. It is shown that nonlinearities and time lags can be included in the calculation of the feedback gains. Author (ESA)

**PRELIMINARY DESIGN STUDY OF A LATERAL-DIRECTIONAL CONTROL SYSTEM USING THRUST VECTORING**

F. J. LALLMAN Nov. 1985 51 p refs
(NASA-TM-86425; L-15990; NAS 1.15:86425) Avail: NTIS HC A04/MF A01 CSCL 01C

A preliminary design of a lateral-directional control system for a fighter airplane capable of controlled operation at extreme angles of attack is developed. The subject airplane is representative of a modern twin-engine high-performance jet fighter, is equipped with ailerons, rudder, and independent horizontal-tail surfaces. Idealized bidirectional thrust-vectoring engine nozzles are appended to the mathematic model of the airplane to provide additional control moments. Optimal schedules for lateral and directional pseudo control variables are calculated. Use of pseudo controls results in coordinated operation of the aerodynamic and thrust-vectoring controls with minimum coupling between the lateral and directional airplane dynamics. Linear quadratic regulator designs are used to specify a preliminary flight control system to improve the stability and response characteristics of the airplane. Simulated responses to step pilot control inputs are stable and well behaved. For lateral stick deflections, peak stability axis roll rates are between 1.25 and 1.60 rad/sec over an angle-of-attack range of 10 deg to 70 deg. For rudder pedal deflections, the roll rates accompanying the sideslip responses can be arrested by small lateral stick motions. E.A.K.

**MISSION-ORIENTED REQUIREMENTS FOR UPDATING MIL-H-8501: CALSPAN PROPOSED STRUCTURE AND RATIONALE Final Report**

C. R. CHALK and R. C. RADFORD Sep. 1985 294 p refs
(Contract NAS2-11303; DA PROJ. 1L1-62209-AH-76-A)
(NASA-CR-177371; USAAVSCOM-TR-85-A-7; NAS 1.26:177371; CALSPAN-REPT-7097-F-1) Avail: NTIS HC A13/MF A01 CSCL 01C

This report documents the effort by Arvin/Calspan Corporation to formulate a revision of MIL-H-8501A in terms of Mission-Oriented Flying Qualities Requirements for Military Rotorcraft. Emphasis is placed on development of a specification structure which will permit addressing Operational Missions and Flight Phases, Flight Regions, Classification of Required Operational Capability, Categorization of Flight Phases, and Levels of Flying Qualities. A number of definitions is established to permit addressing the rotorcraft state, flight envelopes, environments, and the conditions under which degraded flying qualities are permitted. Tentative requirements are drafted for Required Operational Capability Class 1. Also included is a Background Information and Users Guide for the draft specification structure proposed for the MIL-H-8501A revision. The report also contains a discussion of critical data gaps and attempts to prioritize these data gaps and to suggest experiments that should be performed to generate data needed to support formulation of quantitative design criteria for the additional Operational Capability Classes 2, 3, and 4. **A NOVEL LAUNCHER FOR R.P.V.S**

D. GRIFFIN (Frazer-Nash, Ltd., Kingston-upon-Thames, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 20.1-20.11. Research supported by the Ministry of Defence (Procurement Executive).

A flywheel-powered catapult launch system for RPVs has been developed. The system is mounted on the back of a truck and can be prepared for use in a minimum of five minutes. The salient features of the launch system design are illustrated including the flywheel drum arrangement, the motor driving the flywheel, and the electromagnetic brake system. The torque of the flywheel is equal to 80 percent of the acceleration tolerance limit of the RPV. The predicted performance envelopes for a ramp-clutch-flywheel launcher configuration are presented. I.H.

**LAUNCH AND RECOVERY OF AIRBORNE REMOTELY PILOTED VEHICLES**

G. R. VEAZEY, SR. (All American Engineering Co., Newark, DE) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 21.1-21.8.

The principle technologies associated with airborne and ground based RPV recovery and launch systems are briefly reviewed. Consideration is given to hydraulic/pneumatic (HP) launchers; and rocket-based launch systems. Among the recovery systems described are: the STARS net recovery system and a net recovery system incorporating rotary hydraulic kinetic energy absorbers. Black and white photographs of the different launch and recovery systems are provided. I.H.

**A86-10376**

**PORTABLE TACTICAL DISPLAY SYSTEMS FOR RPV'S**

I. GUY (Israel Aircraft Industries, Ltd., Tel Aviv) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Supplementary Papers . Bristol, University of Bristol, 1984, p. 19.1-19.5.

The design of a tactical display system, the Mobile Receiving Unit (MRU)-1000, for the Scout Mini-RPV (MRPV) is discussed. The uses, launch and recovery capabilities, and the ground control station of the Scout MRPV are described. The MRU-1000 is to receive and display, in real time, data transmitted by the Scout MRPV. The functioning of the MRU-1000, which receives television picture and telemetric data, is explained. The MRU-1000 consists of four assemblies: (1) antenna assembly, (2) receiver, (3) decoder and display assembly, and (4) plotter assembly; the components and functions of the assemblies are discussed. The use of the artillery adjustment mode is examined. I.F.

**DESIGN OF STATIC REACTION GANTRY FOR AN ULTRALIGHT AIRPLANE DESTRUCTION TEST**
H. W. SMITH (Kansas, University, Lawrence) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 7 p.
(Contract NAG1-345)
(AIAA PAPER 85-4022)

The steel gantry superstructure needed to perform an airplane static test is described. Standard civil engineering design practices are used to react the loads generated by an airplane in flight. Reaction columns are mounted on a structural floor to carry the wing airloads and the downward acting fuselage loads are carried directly into the floor. The gantry can accommodate a general aviation airplane or rotorcraft. An immediate use for an ultralight airplane is shown as an example configuration of the four main steel frames. Author

**DEVELOPMENT AND USAGE OF A SMALL-SCALE V/STOL GROUND EFFECTS SIMULATOR**
P. A. LORD (California State Polytechnic University, Pomona) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 12 p. refs
(Contract NAG2-49)
(AIAA PAPER 85-4037)

A small scale ground effects simulator for V/STOL aircraft design testing has been built by an American university in association with NASA-AMES. The simulator is used to measure pressures and forces on a wide variety of V/STOL model configurations including generic models which do not represent any particular aircraft. The modes of operation and instrumentation of the simulator are described, and a survey of some recent test results are presented. The basic simulator consists of two parts, an aluminum disk ground plane and a model support. Instrumentation consists of pressure transducers, scanivalves, thermocouples and hot wire anemometers. Test results are presented for single and twin nozzle configurations; a generic V/STOL design, and the Harrier and Grumman 698 combat aircraft models. A black and white photograph of the simulator is provided. I.H.

**EVALUATION OF A LOAD CELL MODEL FOR DYNAMIC CALIBRATION OF THE ROTOR SYSTEMS RESEARCH AIRCRAFT**
R. W. DU VAL, M. BAHRAMI (Advanced Rotorcraft Technology, Inc., Los Altos, CA), and B. WELLMAN (U.S. Army, Research and Technology Laboratories, Moffett Field, CA) IN: Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings . Alexandria, VA, AHS, 1984, 14 p. refs

The Rotor Systems Research Aircraft uses load cells to isolate the rotor/transmission system from the fuselage. An analytical model of the relationship between applied rotor loads and the resulting load cell measurements is derived by applying a force-and-moment balance to the isolated rotor/transmission system. The model is then used to estimate the applied loads from measured load cell data, as obtained from a ground-based shake test. Using nominal design values for the parameters, the estimation errors, for the case of lateral forcing, were shown to be on the order of the sensor measurement noise in all but the roll axis. An unmodeled external load appears to be the source of the error in this axis. Author

**VISUAL AND MOTION CUEING IN HELICOPTER SIMULATION**

R. S. BRAY Sep. 1985 19 p refs

(NASA-TM-86818; REPT-85371; NAS 1.15:86818) Avail: NTIS HC A02/MF A01 CSCL 14B

Early experience in fixed-cockpit simulators, with limited field of view, demonstrated the basic difficulties of simulating helicopter flight at the level of subjective fidelity required for confident evaluation of vehicle characteristics. More recent programs, utilizing large-amplitude cockpit motion and a multiwindow visual-simulation system have received a much higher degree of pilot acceptance. However, none of these simulations has presented critical visual-flight tasks that have been accepted by the pilots as the full equivalent of flight. In this paper, the visual cues presented in the simulator are compared with those of flight in an attempt to identify deficiencies that contribute significantly to these assessments. For the low-amplitude maneuvering tasks normally associated with the hover mode, the unique motion capabilities of the Vertical Motion Simulator (VMS) at Ames Research Center permit nearly a full representation of vehicle motion. Especially appreciated in these tasks are the vertical-acceleration responses to collective control. For larger-amplitude maneuvering, motion fidelity must suffer diminution through direct attenuation through high-pass filtering washout of the computer cockpit accelerations or both. Experiments were conducted in an attempt to determine the effects of these distortions on pilot performance of height-control tasks. Author

(AD-A157641) Avail: NTIS HC A04/MF A01 CSCL 17G

The National Airspace Review (NAR) Enhancement Program is a cooperative government/industry effort to review airspace allocations and the procedural and regulatory aspects of scheduled improvements envisioned under the National Airspace System (NAS) Plan as well as other plans. Its purpose is to identify long-term operational considerations of enhanced systems as they evolve. Improved capabilities resulting from equipment already developed or in the process of development will be examined, with attention being focused on operational considerations rather than specific generation of system requirements. Task Group 4-6.1 of the NAR Enhancement Program convened in Washington, D.C., from January 8 to 10, 1985, and January 29, 1985. This task group was responsible for reviewing and analyzing operational considerations based on the development of enhanced airport surface detection equipment. The recommendations contained herein will be submitted to the Administrator, Federal Aviation Administration, through the NAR Enhancement Executive Steering Committee (EXCOM), for consideration and disposition. **AERODYNAMICALLY LANDING REENTRY VEHICLES [AERODYNAMISCH LANDENDE WIEDEREINTRITTSFAHRZEUGE]**

I. WIDJAJA (ERNO Raumfahrttechnik GmbH, Bremen, West Germany) (Hermann-Oberth-Gesellschaft, Symposium ueber Gefluegelte Raumfahrzeuge, Hanover, West Germany, May 25, 1984) Astronautik (ISSN 0004-6221), vol. 22, no. 1, 1985, p. 16-19. In German.

The considered type of reentry vehicle has the capability to utilize aerodynamic forces and moments for achieving control over its flight path. It is, therefore, possible to reduce or limit the thermal and mechanical stresses to which the vehicle is subjected during its reentry in the atmosphere. The vehicle can be guided to a given landing location, and the reentry window can be enlarged. The considered capabilities are characterized by the lift drag ratio, and a certain price has to be paid for obtaining them. This price is related to a higher structural weight and more complex navigation and guidance systems. For this reason, the lift drag ratio represents a parameter which plays an important part in system optimization considerations. The effect of the lift drag ratio on parameters related to the flight path of the vehicle is considered along with the effect of this ratio on thermal flow phenomena. Attention is given to various reentry vehicle configurations, the results of experimental measurements, and aspects of longitudinal stability and controllability. G.R.

**A86-11769**

**AERODYNAMICALLY LANDING REENTRY VEHICLES [AERODYNAMISCH LANDENDE WIEDEREINTRITTSFAHRZEUGE]**

I. WIDJAJA (ERNO Raumfahrttechnik GmbH, Bremen, West Germany) (Hermann-Oberth-Gesellschaft, Symposium ueber Gefluegelte Raumfahrzeuge, Hanover, West Germany, May 25, 1984) Astronautik (ISSN 0004-6221), vol. 22, no. 2, 1985, p. 39-41. In German.

This article represents a continuation of a paper in the preceding edition of this journal. The longitudinal stability of the reentry vehicle configuration 24B is discussed, taking into account an evaluation of the possibilities for lateral control, aileron effectiveness, and rudder effectiveness. It is pointed out that regarding the selection of the characteristics of the descent trajectory, there are apparently no constraints related to stability or controllability limits. In the hypersonic range, large reciprocal lift drag ratios can also be obtained without positive flap displacement. Attention is given to angle of sideslip relations, a cylindrical body with flat nose and trim tabs, the flow characteristics in the case of a cylinder with a flat nose, graphical relations describing longitudinal stability and controllability in the hypersonic range, and relations involving lift, drag, and the lift drag ratio. G.R.

**THEORETICAL SPECIFIC IMPULSE FOR TWO-PHASE FLOW IN NOZZLE OF ROCKET-RAMJET ENGINE: A SIMPLE ESTIMATION METHOD**

B. SHIGUAN (China Precision Machinery Co.) *In its* Acta Aeron. et Astronautica Sinica (FTD-ID(RS)T-1120-84) p 53-60 4 Oct. 1984 refs Transl. into ENGLISH from Hangkong Xuebao (China), v. 4, no. 4, 1984 p 101-104
Avail: NTIS HC A04/MF A01 CSCL 21H

A theoretical specific impulse formula is derived for two phase flow in nozzle rocket ramjet engine on the basis of similarity to that used for rocket engines. Theoretically, it is proved that the properties of two phase flow in nozzle for these two types of engines can be analyzed with a common combined parameter which is equivalent to the exhaust velocity. A simple estimation method is introduced for specific impulse losses of two phase flow with variable lag. An approximate solution is proposed to deal with the problem of singularity. Author

**HEAVY LIFT LAUNCH VEHICLES FOR 1995 AND BEYOND**

R. TOELLE, comp. Sep. 1985 149 p refs
(NASA-TM-86520; NAS 1.15:86520) Avail: NTIS HC A07/MF A01 CSCL 22B

A Heavy Lift Launch Vehicle (HLLV) designed to deliver 300,000 lb to a 540 n mi circular polar orbit may be required to meet national needs for 1995 and beyond. The vehicle described herein can accommodate payload envelopes up to 50 ft diameter by 200 ft in length. Design requirements include reusability for the more expensive components such as avionics and propulsion systems, rapid launch turnaround time, minimum hardware inventory, stage and component flexibility and commonality, and low operational costs. All ascent propulsion systems utilize liquid propellants, and overall launch vehicle stack height is minimized while maintaining a reasonable vehicle diameter. The ascent propulsion systems are based on the development of a new liquid oxygen/hydrocarbon booster engine and liquid oxygen/liquid hydrogen upper stage engine derived from today's SSME technology. Wherever possible, propulsion and avionics systems are contained in reusable propulsion/avionics modules that are recovered after each launch. Author

**NEW WORLD FOR AEROSPACE COMPOSITES**

W. F. DEMARIO (Northrop Corp., Materials and Process Engineering Section, Ventura, CA) Aerospace America (ISSN 0740-722X), vol. 24, Oct. 1985, p. 36-40, 42.

The applications of composites in aerospace designs are discussed. A description and an explanation of the organic and metal-matrix composites and the reinforcements used in the spacecraft industry are presented. The structural applications for organic and metal-matrix composites for spacecraft are described. Examples of their use in a primary truss assembly, upper and lower cradle assemblies, tubular struts, forward adapter and the engine support of the structure of the Shuttle are provided. The composition and function of the forward adapters of the Shuttle/Centaur and the booms of the Shutttle's remote manipulator system are described. The advantages, applications, and design improvements of thin-ply carbon-carbon are examined. The characteristics of thermoplastic polymers are explained. The development of a new composite which combines aramid and aluminum in a laminate is discussed. I.F.

**EVALUATION OF EXPERIMENTAL EPOXY MONOMERS**

W. T. HODGES, T. L. ST. CLAIR (NASA, Langley Research Center, Hampton, VA), J. R. PRATT, and R. FICKLIN (Mississippi University for Women, Columbus) SAMPE Quarterly (ISSN 0036-0821), vol. 17, Oct. 1985, p. 21-25. Previously announced in STAR as N85-26996. refs

Future generation aircraft need higher performance polymer matrices to fully achieve the weight savings possible with composite materials. New resins are being formulated in an effort to understand basic polymer behavior and to develop improved resins. Some polymer/curing agent combinations that could be useful are difficult to process. In the area of epoxies, a major problem is that some components have physical properties which make them difficult to utilize as matrix resins. A previous study showed that the use of ultrasonic energy can be advantageous in the mixing of curing agents into a standard epoxy resin, such as MY 720 (Ciba-Geigy designation). This work is expanded to include three novel epoxides. R.J.F.

**ON THE RELATIONSHIP BETWEEN FLAME STABILITY AND DRAG OF BLUFF-BODY FLAMEHOLDERS**

N. K. RIZK and A. H. LEFEBVRE (Purdue University, West Lafayette, IN) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 393-398. refs

The main purpose of the investigation is to establish a relationship between the blowoff velocity of a bluff-body flameholder and its drag coefficient. To this end numerous measurements of blowoff velocity and drag coefficient are carried out on various forms of two-dimensional flameholder. They include conventional V-gutters of the type widely employed in turbojet afterburners, and also 'single-sided' flameholders which are characterized by a single-vortex flow pattern in their wake region. The test program covers wide ranges of effective pressure ratio, obtained using the water injection technique, and also includes variations in velocity, flameholder size and flameholder blockage. The results confirm previous findings in regard to the strong influence of drag coefficient on blowoff velocity. They also provide a satisfactory explanation for the previously-reported superior flameholding properties of single-vortex systems over double-vortex systems. Author

### PROBLEMS OF IGNITION CORRELATIONS - AN ASSESSMENT OF APPLICATIONS TO REAL COMBUSTORS

J. ODGERS and D. KRETSCHMER (Universite Laval, Quebec, Canada) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 775-782. refs

The complexity of the ignition process as applied to gas turbine combustors is discussed with reference to the published experimental results and theoretical descriptions. All existing models can be subdivided into two processes: (1) the determination of the liberated spark energy, and (2) the progress of the spark kernel towards successful ignition, but no theoretical model can fully predict these processes quantitatively. The existing empirical and semiempirical ignition correlation formulas can be used for qualitative predictions only, unless a baseline can be established from experimental data. In this case quantitative predictions are sometimes possible within a standard deviation of about 20 percent. I.S.

### COMBUSTION AND EMISSIONS PERFORMANCE OF A RAPID FUEL AND AIR MIXING COMBUSTOR

N. A. AL-DABBAGH, G. E. ANDREWS, and A. R. SHAHABADI (Leeds, University, England) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 804-812. refs

(Contract SERC-GR/A/76894; SERC-GR/B/92812)

A rapid jet mixing combustion system for gas turbine primary zones, with characteristics of low NO(x) and high combustion efficiency, has been developed. This 'jet mix' combustor consists of an array of radial air jets which impinge into an equal number of axial air jets. Fuel is injected in the center of the radial jets. The influence of the proportion of radial air is investigated and shown to have a strong influence on the overall fuel and air mixing rates with a consequent influence on flame stability and NO(x) emissions. It is shown that for 30 percent of the total air in the radial jet, the NO(x) emissions with direct propane injection are at a minimum and close to the premixed situation. Author

### A TYPE OF WIRE FOR COMPOSITES [VID PROVOLOKI DLIA KOMPOZITNYKH MATERIALOV]

A. A. KLEKOVKIN, A. G. CHUSOV, N. A. KLEKOVKINA, and S. A. OGOLIKHIN (Beloretskii Metallurgicheskii Kombinat, Beloretsk; Vsesoiuznyi Nauchno-Issledovatel'skii Institut Aviatsionnykh Materialov; AN SSSR, Institut Metallurgii, Moscow, USSR) Mekhanika Kompozitnykh Materialov (ISSN 0203-1272), July-Aug. 1985, p. 729, 730. In Russian.

Technical requirements are formulated for steel wire used as reinforcement in aluminum-matrix composites. A process for manufacturing stainless steel wire with a tensile strength in excess of 3500 MPa is then presented. The wire, which is made of 18Kh15N5AM3 steel, is used in composites with cold-curing adhesives for the fabrication of the torsion bar of the main rotor of helicopters. V.L.

### STATE-OF-ART AND PROSPECTS OF CASTING TURBINE BLADES

K. YUNG (Chinese Aeronautical Establishment, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, June 1985, p. 201-207. In Chinese, with abstract in English. refs

This paper reviews the state-of-art and history of superalloys and casting turbine blades of aircraft engines in China since 1956. During this time the materials technologists and foundrymen have met the demands of aircraft engines with ever-developing cast-alloys and casting processes for turbine blades. Remarkable successes have been made in fields such as cast rotor blades, ceramic core for hollow channel blades, dispersion-strengthening of Ni-base alloys, computer-based quality control, etc. In view of the prospective advanced gas turbines, ceramic and refractory materials should be developed to meet the requirements of increased operating temperatures (1400 to 1600 C for metallic structure, enhanced surface stability, and superior mechanical properties. Super-alloys will serve in engine components at 550 to 1150 C in the foreseeable future; therefore, it is worth improving refractory metal molds and vacuum die casting to produce the advanced superalloy blades instead of conventional casting processes. ### APPROACHES TO DEVELOPMENT OF COMPOSITE MATERIALS FOR AVIATION INDUSTRY IN CHINA

T. FAN (Beijing Institute of Aeronautical Materials, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, June 1985, p. 223-229. In Chinese, with abstract in English. refs

The state-of-art of composite materials in China is reviewed. Emphasis is put on the technical problems to be studied preferentially for exploitation of composite materials in aviation industry, for example, the seriation of intermediate materials production, the familiarization of fabrication techniques, the rationalization and optimization of composite design, and the establishment of quality assurance system. Principal tasks to be done in these fields and guidelines and directions to be followed are discussed in detail. Theoretical topics related closely to the solution of practical problems are suggested, and attention is called to research works on metal matrix composites. It is expected that the development of composite materials in China will be accelerated by way of proper use of successful foreign experience. Author

### DIRECTIONALLY SOLIDIFIED BLADE SUPERALLOY DZ-22

L. WANG, R. CHEN, and Y. WANG (Beijing Institute of Aeronautical Materials, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, June 1985, p. 236-242. In Chinese, with abstract in English. refs

The directionally solidified (DS) superalloy DZ-22 possesses rather high mechanical properties at both intermediate and high temperatures, for instance, its stress-rupture strength for 100 h at 760 C and 1040 C are 804 MPa and 139 MPa, respectively. Its properties are comparable with the wel known DS superalloy PWA1422; therefore, it is applicable to advanced aircraft engine blades. The chemical composition of DZ-22 is based on the composition of PWA1422, but the content ranges of hafnium and carbon have been readjusted according to experimental results, so its hafnium content is limited in 1.2-2.0 wt pct instead of 1.5-2.5 wt pct and its carbon content is 0.12-0.16 wt pct rather than 0.08-0.14 wt pct. In addition, no zirconium is added intentionally in the alloy. The test results show that the shell-mold with drawn rate during the DS process affects the orientation of columnar crystals. The suitable drawn rate has been established about 7 mm/min. Enhancement of solution temperature during heat treatment can improve stress-rupture life at both 980 C and 1040 C, while the elongation decreases slightly. A pretreatment at 1150 C prior to the solution treatment can raise the incipient melting temperature. Author

### TEMPERATURE DEPENDENCE OF INCLUSION-FRACTURE-RELATED ACOUSTIC EMISSIONS IN 7075-T651 ALUMINUM

S. L. MCBRIDE and J. HARVEY (Royal Military College of Canada, Kingston) Journal of Acoustic Emission, Supplement (ISSN 0730-0050), vol. 4, Apr.-Sept. 1985, p. S220-S223. Research supported by the Defence Research Establishment Pacific. refs

Variations in the acoustic emissions (AE) emitted by crack growth in aerospace Al alloys were studied over a temperature range of -40 C to 120 C, i.e., within the operational range of aircraft. The data recorded included peak AE amplitudes and crack lengths measured by the potential drop technique. The Al specimens were subjected to cyclic fatigue loading over the entire temperature range. The crack growth rate followed a quadratic equation with increasing temperature. Subsequent metallographic examinations indicated that the increase in the number of AE events with crack lengthening was associated with misfit stress effects at the inclusion-matrix interface. The industry is hereby challenged to integrate adhesive technology with the total structure requirements in light of today's drive into automation/mechanization. The state of the art of adhesive technology is fairly well meeting the needs of the structural designers, the processing engineer, and the inspector, each on an individual basis. The total integration of these needs into the factory of the future is the next collective hurdle to be achieved. Improved processing parameters to fit the needs of automation/mechanization will necessitate some changes in the adhesive forms, formulations, and chemistries. Adhesives have, for the most part, kept up with the needs of the aerospace industry, normally leading the rest of the industry in developments. The wants of the aerospace industry still present a challenge to encompass all elements, achieving a totally integrated joined and sealed structural system. Better toughness with hot-wet strength improvements is desired. Lower cure temperatures, longer out times, and improved corrosion inhibition are desired. Author

Avail: NTIS HC A18/MF A01 CSCL 11B

Research on high temperature resin systems has intensified. In the Aerospace Industry, the motivation for this increased activity has been to replace heat resistant alloys of aluminum, stainless steel and titanium by lighter weight glass and carbon fiber reinforced composites. Applications for these structures include: (1) engine nacelles involving long time exposure (thousands of hours) to temperatures in the 150 to 300 C range, (2) supersonic military aircraft involving moderately long exposure (hundreds of hours) to temperatures of 150 to 200 C, and (3) missile applications involving only brief exposure (seconds or minutes) to temperatures up to 500 C and above. Because of fatigue considerations, whenever possible, it is preferable to bond rather than mechanically fasten composite structures. For this reason, the increased usage of high temperature resin matrix systems for composites has necessitated the deviopment of compatible and equally heat stable adhesive systems. The performance of high temperature epoxy, epoxy phenolic and condensation polyimide adhesives is reviewed. This is followed by a discussion of three recently developed types of adhesives: (1) condensation reaction polyimides having improved processing characteristics; (2) addition reaction polyimides; and (3) bismaleimides. Graphite fabric/PMR-15 laminates develop matrix cracks during long-term exposure in air at temperatures in the range of 500 to 600 F. This study was performed to demonstrate the effectiveness of incorporating graphite mat surface plies as a means of reducing the developing of matrix cracks. Celion 3000 graphite fabric/PMR-15 laminates were fabricated with graphite or graphite mat/325-mesh boron powder surface plies. Laminates without mat surface plies were also fabricated for control purposes. Composite flexural strength, flexural modulus, and interlaminar shear strength were determined at 288 C before and after long-term exposure (up to 1500 hr) in air at 316 C. The results of this study showed that the incorporation of graphite mat surface plies reduces matrix cracking and improves the elevated temperature mechanical property retention characteristics of the composites. As part of a program to evaluate high-temperature advanced composites for use on supersonic cruise transport aircraft, two graphite/polyimide composites have been aged at elevated temperatures for times up to 5.7 years. Work on the first, HT-S/710 graphite/polyimide, was started in 1974. Evaluation of the second polyimide, Celion 6000/LARC-160, began in 1980. Baseline properties are presented, including unnotched and notched tensile data as a function of temperature, compression, flexure, shear, and constant-amplitude fatigue data at R = 0.1 and R = -1. Tensile specimens were aged in ovens where pressure and aging temperatures were controlled for various times up to and including 50,000 hours. Changes in tensile strength were determined and plotted as a function of aging time. The HT-S/710 composite aged at 450 F and 550 F if compared to the Celion 6000/LARC-160 composite aged at 350 F and 450 F. After tensile testing, many of the thermal aging specimens were examined using a scanning electron microscope. Results of these studies are presented, and changes in properties and degradation mechanisms during high-temperature aging are discussed and illustrated using metallographic techniques. Author

During the past few years the Boeing Company was screening graphite composites for use in hot areas of engine nacelle structure. Structural and thermal analyses have shown that there is the potential for a 25 to 30 percent weight savings by using a graphite polyimide (Gr/PI) composite material in this type of structure. Work conducted on the NASA CASTS program (Composites for Advanced Space Transportation Systems) amply demonstrated the capability of Graphite/PMR-15 for short term service (125 hours) at temperatures up to 589 K (600 F). In addition, the CASTS program demonstrated that large structures could be fabricated using Gr/PMR-15. In commercial applications, however, the requirement exists for long term service capability (tens of thousands of hours) at temperatures ranging upwards from 449 K (350 F). The results of Graphite/PMR-15 materials characterization efforts conducted at Boeing are presented with emphasis on materials properties after isothermal aging at temperatures of 449 K (350 F) and above. The continuing develoment of PMR-15 composite materials and their associated design properties is pacing the implementation of this technology on commercial aircraft. The guidelines that the FAA has issued regarding the certification of advanced composite structures are very significant with respect to future PMR-15 research and development activities. The FAA has issued an advisory circular dated 1-5-83 concerning guidelines for composite aircraft structures. Of particular significance to PMR-15 technology development is the reliance on combined environmental exposure and component testing, coupled with the stipulation that reliance on previous experience be limited to where common structures and materials have been used for a similar function. Critical environmental exposures for commercial propulsion structures include 50,000 cycle service life, exposure to skydrol, moisture and other fluids, and nacelle fire conditions. G.L.C.

Following from early experience with polyimides on the SST program and Shuttle aft flap studies the Boeing Company is now working on collaborative programs with its principal nacelle suppliers to pursue the development of Gr/PMR-15 nacelle components. Two programs are currently in effect. The first program is directed specifically towards the flight test and service evaluation at the earliest possible date of a 747 nacelle core cowl structure. The second program seeks to firmly establish the producibility and cost of a 757 thrust reverser C duct in a production environment. The near term objectives of these programs include: (1) the comparison of estimated cost and weight of Gr/PMR-15 versus metal structure, (2) the engine test of representative composite structure, (3) the preliminary design and analysis of the C duct structure, and (4) the preparation of cost data and time schedules for the development and producibility program. In addition to powerplant structure, the propulsion ducting system has shown to be a strong candidate for Gr/PMR-15 application. Currently, the Boeing 747 Organization is evaluating the use of PMR-15 matrix composites to replace nearly 800 lbs of titanium ducting per airplane. Author

The application of organic matrix composites to gas turbine engine components has been the subject of numerous government and company funded programs since the 1960's. The possibility of significant weight reductions, performance improvements and lower component costs have made the organic matrix composites extremely attractive to aircraft engine designers. Very little of this potential was incorporated into production engines over the years even though a significant number of components were designed, fabricated and tested. Some of the reasons behind the slow rate of incorporation include the following: (1) criticality; (2) engine operating temperature; (3) small component size; (4) small production volume; (5) high production cost; and (6) interfacing with metal parts. G.L.C.

Intermodulation interference (IMI) occurrs when high frequency (HF) transmitters and receivers are placed in close proximity, particularly on ships and aircraft, due to non-linear conduction through metal-oxide-metal (MOM) junctions in the supporting structure. Welding or clamping straps cannot be used where there is a multiplicity of MOM junctions, such as in chains or twisted cable, or where dissimilar metals are involved. Additionally, the use of non-conductive materials or conductive straps is very expensive. To overcome these limitations while effectively reducing IMI, an inexpensive method that maintains the structural integrity of supporting hardware while providing a highly conductive current path is required. The chemical composition of the present invention used to overcome IMI contains compounds similar to rust removal compositions which have incorporated the general principles of chelating the ferric ion, incorporating the ion into a polymer material, and removing the rust with one polymer material. **FILAMENT WINDING - WAKING THE SLEEPING GIANT**
W. T. FREEMAN, JR. and B. A. STEIN (NASA, Langley Research Center, Hampton, VA) Aerospace America (ISSN 0740-722X), vol. 24, Oct. 1985, p. 44-46, 48, 49.

The use of filament winding (FW) in the production of aerospace composite structures is examined. The FW process applies spools of fiber and prepreg tow or prepreg tape to a male mandrel; the process is more efficient and cost effective than metallic construction. The fibers used in FW and the curing process are explained. The reduced storage and fabrication costs that result from FW are discussed. The use of FW to produce a filament-wound case for a solid rocket motor and the substructure and skin of an aircraft fuselage are described. Areas which require further development in order to expand the use of FW are listed and discussed. I.F.

### COMPUTATIONAL FLUID DYNAMICS - ITS PRESENT STATUS AND FUTURE DIRECTION

E. KRAUSE (Aachen, Rheinisch-Westfaelische Technische Hochschule, West Germany) Computers and Fluids (ISSN 0045-7930), vol. 13, no. 3, 1985, p. 239-269. DFG-supported research. refs

Developments and advances in numerical fluid dynamics are being reviewed with emphasis on physical aspects in preference to methodical questions. The governing equations of fluid dynamics, describing the conservation of mass, momentum, and energy are discussed first. Recent work on predictions of inviscid, and of boundary-layer flows is then described in the following two sections. Thereafter, computations of fully viscous flows by numerical solutions of the Navier-Stokes equations are elucidated with several examples of the recent literature. Author

### THE DEVELOPMENT OF A VERTICAL GYROSCOPE FOR REMOTELY PILOTED VEHICLE (RPV) APPLICATIONS

D. W. ALFORD (Ferranti Instrumentation, Ltd., Bracknell, England) IN: Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings . Bristol, University of Bristol, 1984, p. 26.1-26.18. Research supported by the Ministry of Defence (Procurement Executive).

The development of gyroscope technology over the last forty years is reviewed with emphasis given to air-powered gyroscopes; hermetically sealed gyroscopes; and electrically powered attitude indicators. Some design improvements incorporated into the Type FS60A Vertical Gyroscope for RPV applications are considered. The gyroscope design consists of a motor stator, two gyro wheel halves, and the top and bottom gyro wheel housings. The stator is wound to accept the output of a 400-Hz three-phase static inverter. The outer gimbal axis is mounted vertical to the azimuthal axis, and azimuthal position are measured using a sine/cosine potentiometer. The angular momentum of the gyro is 11,000,000 g per sq cm, and the rotor speed is 22,500 r/min nominal. The gyro pendulum error loci for turning flight are shown in a line drawing. I.H.

### CORRECTION OF LIFT COEFFICIENT FOR TANDEM CIRCULAR-CASCADE DIFFUSERS

H. HAYAMI, Y. SENOO (Kyushu University, Fukuoka, Japan), and F. KITAYAMA JSME, Bulletin (ISSN 0021-3764), vol. 28, July 1985, p. 1354-1358. refs

The interaction between two rows of cascades is discussed quantitatively. The lift characteristics of each cascade of a tandem cascade are calculated numerically based on a two-dimensional potential theory, and the result is compared with the lift characteristics of the individual cascades without mutual interaction; then, the correction factors due to mutual interaction are obtained. The performance of a low-solidity circular tandem-cascade diffuser is predicted using those correction factors and compared with experimental results. The blade circulation of each cascade is also evaluated from the measured pressure distribution along the blade surface and compared with the prediction. C.D.

### PREDICTION OF OUTLET FLOW CHARACTERISTICS OF CENTRIFUGAL IMPELLERS. I - CONSIDERATION OF VELOCITY DISTORTION

J. KUROKAWA (Yokohama National University, Japan) and S. HODE (Mitsubishi Heavy Industries Co., Ltd., Kobe, Japan) JSME, Bulletin (ISSN 0021-3764), vol. 28, July 1985, p. 1423-1429. refs

An analytical method for predicting the outlet flow characteristics from a centrifugal impeller is proposed. The method takes hub-to-shroud and blade-to-blade velocity distortion into consideration, and its usefulness is confirmed by measurements with pump impellers. It is concluded that, in calculating the theoretical head coefficient and the slip factor from the measured velocity of the absolute flow at the impeller outlet, the mass-averaged velocity of the section should be used. To get satisfactory prediction of the outlet flow characteristics, the increment of the wall shearing stress near the inlet of the parallel-walled diffuser channel due to the nonuniform flow must be considered. The influence of velocity distortion in the hub-to-shroud direction should be considered when the parallel-walled diffuser width is larger than the impeller exit width. C.D.

### THE LAMINAR-TURBULENT TRANSITION ZONE IN THE BOUNDARY LAYER

R. NARASIMHA (Indian Institute of Science; National Aeronautical Laboratory, Bangalore, India) Progress in Aerospace Sciences (ISSN 0376-0421), vol. 22, no. 1, 1985, p. 29-80. Research sponsored by the Aeronautics Research and Development Board. refs

The flow during transition from the laminar to a turbulent state in a boundary layer is best described through the distribution of the intermittency. In constant-pressure, two-dimensional flow, turbulent spots appear to propagate linearly; the hypothesis of concentrated breakdown, together with Emmons's theory, leads to an adequate model for the intermittency distribution over flow regimes ranging all the way from low subsonic to hypersonic speeds. However, when the pressure gradient is not zero, or when the flow is not two-dimensional, spot propagation characteristics are more complicated. The resulting intermittency distributions often show peculiarities that may be best viewed as 'subtransitions'. Previous experimental results in such situations are reviewed and recent results and models are discussed. The problem of predicting the onset of transition remains difficult, but is outside the scope of the present article. Although this paper is intended to be chiefly a survey, several new results in various stages of publication are also included. Author

### EXTENSION OF THE BLASIUS FORCE THEOREM TO SUBSONIC SPEEDS

A. BARSONY-NAGY (Technion - Israel Institute of Technology, Haifa, Israel) AIAA Journal (ISSN 0001-1452), vol. 23, Nov. 1985, p. 1811, 1812. Research supported by the Technion V.P.R. Fund-L. Rogow Aeronautical Research Fund. refs

The theorem considered by Blasius (1910) represents a well-known method for calculating the force on a body situated in an incompressible, inviscid two-dimensional flow. The efficiency of the Blasius theorem is due to its quality of expressing the forces with the aid of contour integrals of analytic functions of complex variables. The present note has the objective to deduce an analog of Blasius theorem for the aerodynamic forces in subsonic flow. It is assumed that an approximate velocity potential of the subsonic flow has been calculated by using the Imai-Lamla method. It is pointed out that this method is a variant specially suited for the two-dimensionally flows of the Janzen-Rayleigh expansion method. The derived formula expresses the aerodynamic forces with the aid of contour integrals of analytic complex functions. It can be regarded as the Blasius theorem with first-order compressibility correction for the subsonic speed regime. G.R.

### MODE INTERACTION HOPF BIFURCATION IN AXISYMMETRIC SHELLS

A. MAEWAL (Yale University, New Haven, CT) IN: 1984 advances in aerospace sciences and engineering: Structures, materials, dynamics, and space station propulsion; Proceedings of the Winter Annual Meeting, New Orleans, LA, December 9-14, 1984 . New York, ASME, 1984, p. 135-138. refs

(Contract AF-AFOSR-82-076)

The Hopf bifurcation in axisymmetric shells is analyzed, taking into account the structural nonlinearities as well as the mode interaction between circumferentially traveling waves. Aerodynamic flutter is the most notable physical realization of Hopf bifurcation. The results obtained can form a basis for a computational algorithm for analysis of flutter of shells of revolution along the lines of the numerical schemes for nonlinear oscillations. F.J.

### SERVO-ELASTIC OSCILLATIONS - CONTROL OF TRANSIENT DYNAMIC MOTION OF A PLATE

S. N. ATLURI (Georgia Institute of Technology, Atlanta) and P. E. ODONOGHUE IN: 1984 advances in aerospace sciences and engineering: Structures, materials, dynamics, and space station propulsion; Proceedings of the Winter Annual Meeting, New Orleans, LA, December 9-14, 1984 . New York, ASME, 1984, p. 139-147. refs

(Contract AF-AFOSR-84-0020)

The control of the transient dynamic response of an initially stressed flat plate representing the continuum model of a large space structure (LSS) is presented using a boundary-element approach. The discretization of the equation of motion of the plate, using a singular solution approach, the control of dynamic response, and the control spillover are discussed. The implementation of algorithms for an efficient solution of Ricatti equations is accomplished. F.J.

### OPERATIONAL AND SUPPORT CONSIDERATIONS IN STANDARDIZATION

W. T. OREILLY (Westinghouse Defense and Electronics Center, Baltimore, MD) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 115-119.

(AIAA PAPER 85-5063)

Military applications in the era of the 1990's and beyond, require capabilities beyond those available in most existing systems. These capabilities must be provided in a manner that will achieve a low logistic support cost and that can be maintained with relatively inexperienced personnel. This paper presents the design considerations that must be addressed in each of the standardized subsystems and modules that will provide the operational and support needs for tomorrow and beyond. Advanced maintenance concepts, such as two and one level maintenance, are described together with the operational and life cycle cost benefits that will be achieved. A new operation concept called deferred maintenance, which provides sustained operation without maintenance support, is presented. The fault tolerant architecture which will permit a standardized modular design to efficiently accommodate a variety of system applications is presented. The concerns discussed include combat damage survivability, fail safe and fail operational needs, as well as high availability for long life applications as is required for systems employed in the Space Defense Initiative (SDI). ### NEW DIRECTIONS IN AEROSPACE PACKAGING

J. W. KANZ (Hughes Aircraft Co., El Segundo, CA) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 427-431. refs

(AIAA PAPER 85-6033)

The packaging of electronic devices for aerospace applications is discussed. Consideration is given to the problems encountered in dual-in-line packaging; surface mounting; and pin-grid-arrays. Some limitations of Leadless Chip Carrier (LLC) packages are discussed with respect to reliability; standardization; and handling and testing. I.H.

**A86-11460#**

### RADIATION HARDENED CMOS TECHNOLOGY FOR FLIGHT SYSTEMS

B. PEARSON (Harris Semiconductor, Melbourne, FL) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 449-452.

(AIAA PAPER 85-6040)

The techniques used to harden CMOS devices against the effects of radiation are examined, and the performance tradeoffs of hardened versus nonhardened devices are discussed. In particular, attention is given to the following three technologies used in the manufacture of hardened CMOS: CMOS on EPI silicon, silicon on insulator, and dielectric isolation. Finally, the hardness levels attainable with these three technologies are compared with those of bipolar devices. V.L.

**VISION-BASED ROAD FOLLOWING FOR AN AUTONOMOUS LAND VEHICLE**

A. M. WAXMAN, J. LE MOIGNE, B. SRINIVASAN, L. S. DAVIS, and A. ROSENFELD (Maryland, University, College Park) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 453-458.

(Contract DAAK70-83-0018; DAAK76-84-C-0004; DARPA ORDER 3206; DARPA ORDER 5096)

(AIAA PAPER 85-6047)

An approach to visual navigation developed under the Autonomous Land Vehicle project is presented. The approach includes a bootstrap phase and a feed-forward phase, with visual processing in each phase executed in three modules: an image processing module, a geometry module, and a rule-based reasoning module. Process control for road following is described, with particular attention given to the image processing algorithms for the bootstrap phase. Guidelines for future work are briefly discussed. V.L.

**OPTIMISATION OF RECESS-ACTION CONFORMAL PROFILES FOR AERO GAS-TURBINE ENGINE GEARS - A COMPUTER BASED ANALYTICAL APPROACH**

K. RAMACHANDRA, N. NAGARAJ, and R. PADMANABHAN (Gas Turbine Research Establishment, Bangalore, India) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 165-172. refs

Profile parameters of recess-action gears and the factors influencing contact stress are discussed. A single profile parameter, the tooth thickness, was optimized with respect to the ratio of the allowable contact to bending stress. It is concluded that the tooth-profile parameters can be independently optimized so that the ratio of contact to induced bending stress equals the allowable stress ratio for the type of gear material used. It is shown that, for helix angles lower than 20 deg, the thicknes of the pinion tooth can be reduced without reducing the load-carrying capacity, and the conventional thickness of the wheel tooth must be increased to make optimum use of the material strength. I.S.

**A86-11621#**

**A SIMPLE METHOD FOR EVALUATING THERMAL STABILITY OF LABYRINTH SEALS**

S. PATHAK (Hindustan Aeronautics, Ltd., Engine Design Bureau, Bangalore, India) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 191-198. refs

A relatively simple criterion is defined for a quick check of thermal stability of labyrinth seals in gas turbine engines following rub in service. In spite of its simplicity, the criterion agrees well with the results obtained from the established sophisticated program. The criterion and the defined considerations apply to both stable and unstable designs, successfully predicting either stability or instability. The parameters of influence lay down guidelines for the designer in considering configurations of stable seals. I.S.

**A86-11696#**

**EXPERIMENTAL RESULTS FROM A REVERSE FLOW ANNUAL COMBUSTOR**

F. M. JOUBERT and H. V. HATTINGH (Stellenbosch, University, Republic of South Africa) IN: International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings . New York, AIAA, 1985, p. 787-793. refs

Computer-predicted temperature distributions in the wall liners of a combustion chamber were compared to the experimentally obtained values from combustion tests carried out in a small, full-scale reverse-flow annular combustor at sea level take-off conditionns. The largest discrepancies between the measured and predicted linear temperatures occured in the primary zone, with most of the predictions falling above the measured values, and with neither of the two computer programs satisfying the accuracy of 4 percent (of the experimental values) needed for making estimates on the life of a combustor. On the other hand, the correlation between the measured and predicted liner pressure drop was satisfactory. The validity and usefulnes of simple computer models as aids in the design of gas turbine combustion chambers are discussed. I.S.

**A86-11755**

**ON FLAW SIZE AND DISTRIBUTION IN LAP JOINTS**

C. L. CHOW and C. W. WOO (University of Hong Kong, Hong Kong) Theoretical and Applied Fracture Mechanics (ISSN 0167-8442), vol. 4, Aug. 1985, p. 75-82. refs

The effect of internal flaw size and its distribution along the adhesive layer on the fracture behavior of an adhesive-bonded lap joint is investigated; adhesive lap joints are often used in both aircraft and aerospace applications. The finite element method is used to examine the localized shear stress distribution developed in the lap joint with or without bonding flaws. It is found that the shear stress distribution for adhesive joints without internal defects resembles that of an 'ideal' lap model with high stress concentrations at the lap ends and relatively low stresses over the major central portion of the lap length. It is also found that a central internal lap flaw has little effect on the overall stress distribution. However, an internal flaw close to the lap end increases the maximum shear stress. In addition, adhesively bonded aluminum specimens are analyzed, noting their fracture strength reduction when an internal flaw is present. F.J.

**THE INFLUENCE OF THICKNESS IN PREDICTIONS OF LIFETIME AND CRACK PROPAGATION IN CASES INVOLVING DYNAMICALLY LOADED AERONAUTICAL METAL SHEETS [DICKENEINFLUSS BEI DER LEBENSDAUER- UND RISSFORTSCHRITTSVORHERSAGE DYNAMISCH BEANSPRUCHTER LUFTFAHRTBLECHE]**

P. MAKRIS and K. STEIN (Athens, National Technical University, Greece) Materialpruefung (ISSN 0025-5300), vol. 27, Aug. 1985, p. 228-233. In German. Research supported by the Aluminium Hellas. refs

Makris and Stein (1984) have discussed a procedure for predicting crack propagation and lifetime in the case of metal sheets used in aircraft construction, taking into account dynamic stresses on the basis of engineering model concepts. The present paper is concerned with the effect of the thickness of the specimens on their lifetime. The reported investigation includes an evaluation of experiments which have been conducted with specimens consisting of the material AlCuMg2. The mechanisms involved in the effects produced by differences in specimen thickness are examined, giving attention to statistical size effects, stress-mechanical size effects, technological size effects, and fracture-mechanics thickness effects. Possibilities for taking into account thickness effects in a lifetime prediction based on the model considered by Makris and Stein are also discussed. G.R.

### CONCENTRATION DISTRIBUTIONS IN CYLINDRICAL COMBUSTORS

S. A. AHMED and R. M. C. SO (Arizona State University, Tempe) IN: Experimental measurements and techniques in turbulent reactive and non-reactive flows; Proceedings of the Winter Annual Meeting, New Orleans, LA, December 9-14, 1984 . New York, ASME, 1984, p. 91-106. refs
(Contract NAG3-260)

Experimental studies have been conducted with the aim to obtain a better understanding of the fluid dynamics of mixing in gas turbine combustors, and solid fuel ramjet combustors subject to spin. The present investigation represents a continuation of studies conducted by So et al. (1984). It is also concerned with the verification of some conclusions reported by Ahmed et al. (1984). Attention is given to the experimental facility and instrumentation, centerline concentration measurements, mean concentration profiles, and a comparison of concentration and axial velocity results in the case of swirling flow. G.R.

### SCALAR AND MOMENTUM TURBULENT TRANSPORT EXPERIMENTS WITH SWIRLING AND NONSWIRLING FLOWS

B. V. JOHNSON, R. ROBACK (United Technologies Research Center, East Hartford, CT), and J. C. BENNETT (Connecticut, University, Storrs) IN: Experimental measurements and techniques in turbulent reactive and non-reactive flows; Proceedings of the Winter Annual Meeting, New Orleans, LA, December 9-14, 1984 . New York, ASME, 1984, p. 107-119. refs
(Contract NAS3-22771)

Combustor models for the aircraft gas turbine industry have been obtained because of the need to reduce the costs of developing improved performance and more durable engines. A few years ago, it became apparent that the mass concentration and velocity predictions provided by the computer codes were not representing the data measured in some confined recirculating flows. It is pointed out that errors in the mass concentration distribution are an especially serious problem because of their influence on the heat release, temperature, and reactant distributions. Combined mass and momentum turbulent transport experiments with swirling and nonswirling flow have been conducted with the objective to obtain an experimental data base which can be used to evaluate and improve the turbulent transport submodes employed in the aerothermal models. The present paper is mainly concerned with the overall characteristics of the mass turbulent transport processes in complex flows with recirculation and the deficiencies of the conventional models. G.R.

### AN OVERVIEW OF EMP EFFECTS AND THEIR CONTROL

A. J. CULLIGAN (Plessey Assessment Services, Ltd., England) (Society of Environmental Engineers, International Symposium on Product Design Assurance in Engineering, Wembley, England, June 11-13, 1985) Society of Environmental Engineers, Journal (ISSN 0374-356X), vol. 24-3, Sept. 1985, p. 9-11. refs

The environments associated with a nuclear detonation are probably the most extreme of all the environments to which an electronic equipment system may be exposed. One of these environments is related to the electromagnetic pulse (EMP) which represents an intense pulse of radiated electromagnetic energy. The endo-atmospheric EMP is generally not considered a major threat in comparison with other nuclear weapon effects related to blast, thermal phenomena, neutrons, and gamma rays. The situation is different with respect to the exo-atmospheric EMP which has the potential to simultaneously damage communication and allied networks over many thousands of square miles. The present paper is concerned with these EMP effects and the possibilities for protecting equipment from EMP. For such a protection, an understanding of the system's electronic topology is essential, and component/circuit susceptibility levels must be specified. Attention is given to the wire grid model of a strike aircraft, and the simulation of the EMP environment. G.R.

### AERODYNAMIC RESISTANCE OF PERFORATED PLATES IN NATURAL CONVECTION

M. ISHIZUKA, Y. MIYAZAKI, and T. SASAKI (Toshiba Corp., Research and Development Center, Kawasaki, Japan) JSME, Bulletin (ISSN 0021-3764), vol. 28, Aug. 1985, p. 1697-1702.

This paper describes some experimental results about aerodynamic resistance of perforated plates in natural convection, which are useful for designing casings of electronic equipment. Since velocity through a perforated plate and pressure loss are very small in the case of natural convection, the conventional method can not be used to measure the resistance of the plate with reasonable accuracy. Therefore, a new method was developed to obtain resistance coefficients of plates by temperature measurement, since differential temperature between the upstream flow of a perforated plate and the downstream one is related to its aerodynamic resistance. Using the proposed method, further experiments were performed to study the influence of various parameters, such as Reynolds number, porosity coefficient, and plate thickness/hole diameter on resistance coefficients of perforated plates. Author

### A MEASUREMENT METHOD TO EVALUATE FLUID FORCE ON BLADES

H. ISHII and N. HAGIWARA (Hitachi, Ltd., Mechanical Engineering Research Laboratory, Tsuchiura, Japan) JSME, Bulletin (ISSN 0021-3764), vol. 28, Aug. 1985, p. 1741-1748. refs

The purpose of this study is to establish a measurement method for the fluid force acting on axial turbo machines. The method aims to evaluate the fluid forces as divided into two components, i.e., exciting force and damping force. This method is found to be satisfactory in comparison with other ordinary methods of estimating the fluid force acting on a column test piece in a wind tunnel. According to the results of a test using an axial compressor model with flat blades, the method can quantitatively predict the fluid force acting on rotating blades. Moreover, it is applicable to actual machines. Author

### AE MONITORING OF JET ENGINE BREECH CHAMBERS

N. DHOND and D. M. EGLE (Oklahoma, University, Norman) Journal of Acoustic Emission, Supplement (ISSN 0730-0050), vol. 4, Apr.-Sept. 1985, p. S30, S31. refs

It is pointed out that a breech chamber is an important component of the emergency or quick starting mechanism in jet engines. The hot gases produced from a rapidly burning cartridge drives a turbine which rotates the engine. Premature failures in these chambers, which may occur occasionally, can have serious consequences. It is believed that one of the causes of failure is related to stress corrosion cracking (SCC). For this reason, an investigation was conducted concerning the possibility to use acoustic emission (AE) as a means of detecting the presence of SCC and/or participating critical flaws. A commercially available AE system was used to monitor the chambers. Aspects of AE activity in breech chambers are discussed, and approaches for distinguishing a growing crack from other sources of AE are considered. G.R.

**A86-12562**

### ACOUSTIC EMISSION STUDIES FOR DETECTION AND MONITORING INCIPIENT CRACKS IN A SIMULATED AERO ENGINE MOUNT UNDER FATIGUE

S. C. PATHAK and C. R. L. MURTHY (Indian Institute of Science, Bangalore, India) Journal of Acoustic Emission, Supplement (ISSN 0730-0050), vol. 4, Apr.-Sept. 1985, p. S32-S34. Research supported by the Aeronautical Research and Development Board.

Fatigue crack growth in critical structural members affects safety, operational availability, and maintenance of an aircraft. A long felt need exists, therefore, for a procedure involving the remote detection and monitoring of incipient fatigue cracks in critical aircraft structures. A dynamic nondestructive testing (NDT) technique which continuously monitors critical assemblies is required, taking into account early warning before the cracks reach limits of criticality. Acoustic emission (AE) appears to be most suited for this application. However, the AE technique requires further development for the considered employment. The present investigation represents the first step in such a development. An attempt is made to develop a criterion for establishing correlation between true AE data and crack initiation and growth in the presence of typical noise sources. G.R.

**A86-12573**

### IN-FLIGHT AE MONITORING

G. G. MARTIN and I. G. SCOTT (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) Journal of Acoustic Emission, Supplement (ISSN 0730-0050), vol. 4, Apr.-Sept. 1985, p. S142-S146. refs

In August 1978, acoustic emission (AE) monitoring equipment was installed in a Royal Australian Air Force Macchi jet trainer aircraft to assess the feasibility of using AE for in-flight monitoring of crack growth. Aircraft of the considered type are flown under a safety-by-inspection procedure involving the monitoring of growing fatigue cracks in the center-section assembly tension spar with the aid of a magnetic rubber inspection (MRI) technique. Attention is given to the employed AE monitoring system, the test program, and a discussion of the test results. These results establish the feasibility of monitoring crack growth, during flight of a jet trainer aircraft. However, further work is needed before AE sources can be identified. G.R.

**A86-12575**

### ACOUSTIC EMISSION MONITORING OF AIRCRAFT STRUCTURES

S. L. MCBRIDE (Royal Military College of Canada, Kingston) and J. W. MACLACHLAN (Johns Hopkins University, Baltimore, MD) Journal of Acoustic Emission, Supplement (ISSN 0730-0050), vol. 4, Apr.-Sept. 1985, p. S151-S154. Research supported by the Defence Research Establishment Pacific. refs

Since the mid-1970s, several studies have explored the feasibility of using acoustic emission to monitor the integrity of aircraft structural components. This paper provides a summary of the principal findings of the program of the Canadian Department of National Defence in this area. In phase I of this program, a single-channel recording system was used to record data in-flight from a wing attachment component on the CF100 jet interceptor aircraft during a period of about a year. It was found that the transient burst signals detected varied over at least two orders of magnitude in amplitude and in number of events per flying hour. In phase II, a dual-channel recording system was employed to record simultaneously data from two symmetrically located wing attachments, while in phase III, a precracked laboratory test specimen was mounted in a structure across the inner fuselage of a CC130 aircraft. G.R.

**A86-12600**

### RELIABILITY OF WIDE-BODY AIRCRAFT [NADEZHNOST' SHIROKOFIUZELIAZHNYKH SAMOLETOV]

G. V. NOVOZHILOV Akademiia Nauk SSSR, Vestnik (ISSN 0002-3442), no. 8, 1985, p. 93-101. In Russian.

The use of a systems approach in assuring the reliability and flight safety of commercial wide-body aircraft is discussed with particular reference to the Il-86 and Il-96 aircraft. The role of computer-aided design is emphasized, and specific steps taken at each stage of aircraft design and testing to assure the reliability of the individual components and of the aircraft as a whole are discussed. Particular attention is given to the use of finite elements in displacements for the strength analysis of aircraft structures. V.L.

**A86-12608**

### TURBULENCE CHARACTERISTICS OF A PLANE DIFFUSER FLOW WITH INLET VELOCITY DISTORTION

P. A. ASWATHA NARAYANA, N. V. CHANDRASEKHARA (Indian Institute of Technology, Madras, India), and V. K. CHITHAMBARAN Indian Institute of Science, Journal, Section A - Engineering and Technology (ISSN 0019-4964), vol. 65, April 1984, p. 57-70. refs

An experimental study of turbulent characteristics of incompressible flow in a two-dimensional diffuser with inlet velocity distortion is reported. Turbulence level in the boundary layer increases marginally towards the exit of the diffuser and decreases rapidly in the wake region. The region of maximum velocity fluctuation and the maximum Reynolds shear stress shifts away from the wall in the streamwise direction. The energy spectra of the turbulent kinetic energy in the wake region shows a characteristic behaviour indicating possible vortex shedding from the trailing edge of the airfoil. Author

### TRIALS ON THE ASPERITY COUNTING MONITORING SYSTEM Final Report

R. WORDSWORTH (Imperial Coll. of Science and Technology) and P. B. MACPHERSON May 1984 32 p refs
(Contract A12/1347)
(RES-PAPER-670; BR93962) Avail: Issuing Activity

A monitoring system, based on asperity contacts within a loaded and lubricated pair of metal surfaces, was evaluated in a mini disk machine. Results confirm the sensitivity of the system to changes in surface topography. With additional storage capacity available in microcomputers, a tool for laboratory test running normally undertaken in a mechanical research laboratory is available. The monitor could also be applied in a gearbox test rig for studying the performance of a specific bearing or gear set.

Although interest in grease as a gearbox lubricant waned an effective system for routine monitoring of helicopter tail and intermediate gearboxes is feasible. Author (ESA)

(AD-D011746; US-PATENT-APPL-SN-718399) Avail: NTIS HC A02/MF A01 CSCL 17D

An AIRBOC (Air Rapid Bloom Offboard Chaff) chaff deployment apparatus comprising a canister with a wind flap attached externally to the canister and connected to a drogue chute that is housed inside the canister. The drogue chute is situated atop a main chute that is atop a release mechanism, which is atop a fuze and that is atop a chaff payload, all of which is housed inside the canister. When the AIRBOC is dropped from a plane, the wind flap extends, pulling out the drogue chute. The drogue chute in turn activates the release mechanism which frees the drogue chute to pull out the main chute to which the drogue chute is connected. The deployment of the main chute causes a force greater than 40 lbs to be applied to the release mechanism, resulting in the chaff payload being released from the canister and the fuze being activated, consequently detonating the released chaff payload. The effects of fatigue loading on the behavior of graphite/epoxy panels with either S-Glass or Kevlar-49 buffer strips is studied. Buffer strip panels are fatigued and tested in tension to measure their residual strength with crack-like damage. Panels are made with 45/0/-45/90 sub 2s layup with either S-Glass or Kevlar-49 buffer strip material. The buffer strips are parallel to the loading direction and made by replacing narrow strips of the 0-degree graphite plies with strips of either 0-degree S-Glass/epoxy or Kevlar-49/epoxy on a one-for-one basis. The panels are subjected to a fatigue loading spectrum MINITWIST, the shortened version of the standardized load program for the wing lower surface of a transport aircraft. Two levels of maximum strain are used in the spectrum with three durations of the fatigue spectrum. One group of panels is preloaded prior to the application of the fatigue cycling. The preload consists of statistically loading the spectrum in tension until the crack-tip damage zone reaches the ajacent buffer strips. After fatigue loading, all specimens are statistically loaded in tension to failure to determine their residual strengths. Author

A brief history of aircraft production techniques is given. A flexible machining cell is then described. It is a computer controlled system capable of performing 4-axis machining part cleaning, dimensional inspection and materials handling functions in an unmanned environment. The cell was designed to: allow processing of similar and dissimilar parts in random order without disrupting production; allow serial (one-shipset-at-a-time) manufacturing; reduce work-in-process inventory; maximize machine utilization through remote set-up; maximize throughput and minimize labor. **THE ALTERNATING SURFACE SEGMENTED LAP JOINT: A DESIGN FOR THIN HIGHLY LOADED JOINTS**
V. E. WATKINS, JR. and G. C. FIRTH *In its* Welding, Bonding and Fastening, 1984 p 67-76 Sep. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 13E

The combination of thin airfoil sections and high aerodynamic loads on many wind tunnel models presents a major problem for attachment of flap elements. Conventional methods of attaching fixed control elements such as lap and tongue-in-groove joints are not rigid enough to provide surface continuity required in high Reynolds number research. For the extreme cases, the solution has been to fabricate separate wings for each flap setting with the flap element being and integral part of the wing. Here an attractive solution to this problem, the alternating surface segmented lap joint, is discussed. This joint provides increased rigidity and lower stress levels than conventional joints. Additionally, attachment fastener loading is low and the joint can be designed to accommodate high shear levels due to bending without the use of dowel pins. Author

**ADVANCES IN JOINING TECHNIQUES USED IN DEVELOPMENT OF SPF/DB TITANIUM SANDWICH REINFORCED WITH METAL MATRICES**
J. E. FISCHLER *In* NASA. Langley Research Center Welding, Bonding and Fastening, 1984 p 297-322 Sep. 1985
Avail: NTIS HC A21/MF A01 CSCL 13M

Three and four-sheet expanded titanium sandwich sheets have been developed at Douglas Aircraft Company, a division of McDonnell Douglas Corporation, under contract to NASA Langley Research Center. In these contracts, spot welding and roll seam welding are used to join the core sheets. These core sheets are expanded to the face sheets and diffusion bonded to form various type cells. The advantages of various cell shapes and the design parameters for optimizing the wing and fuselage concepts are discussed versus the complexity of the spot weld pattern. In addition, metal matrix composites of fibers in an aluminum matrix encapsulated in a titanium sheath are aluminum brazed successfully to the titanium sandwich face sheets. The strength and crack growth rate of the superplastic-formed/diffusion bonded (SPF/DB) titanium sandwich with and without the metal matrix composites are described. Author

**VALIDATION OF PROCEDURES FOR PAVEMENT DESIGN ON EXPANSIVE SOILS Final Report, May 1984 - Aug. 1985**
R. G. MCKEEN Washington FAA Jul. 1985 99 p refs
(Contract F29601-84-C-0080)
(FAA-PM-85-15; NMERI-WA5-4(5.02)) Avail: NTIS HC A05/MF A01

This report documents site investigations and design recommendations for airport pavements on expansive soils at three sites. The methods used were developed previously in an FAA-sponsored research project. The design procedure involves soil characterization, determination of surface characteristics and evaluation of soil-pavement interaction. Investigations at three airports are reported; they are Murdo, South Dakota, Mesquite, Texas, and Love Field, Dallas, Texas. Soils data are used along with climatic information to obtain estimates of the equivalent thickness of pavement required for each site. The work at Love Field was somewhat different than the other sites since NMERI was not directly conducting the investigation. Results are reported in the form of pavement thickness required to adequately perform, in terms of surface roughness, on the soil surface characteristics predicted for each site. Recommendations are included for consideration in rehabilitation of each site since all were experiencing surface roughness at the time of the investigations. These results confirm that methods developed for evaluating airport pavements on expansive soils provide useful information for pavement design. B.W.

**APPLICATION OF THE VORTEX-LATTICE CONCEPT TO FLOWS WITH SMOOTH-SURFACE SEPARATION Final Report**
D. F. THRASHER Jul. 1985 69 p
(AD-A157571; DTNSRDC-85/041) Avail: NTIS HC A04/MF A01 CSCL 20D

Numerical schemes based on the vortex-lattice concept have had considerable success in treating the fully three-dimensional separated potential flow over low aspect-ratio thin wings at high incidence and the attached potential flow over bodies of more general shape. In principle, the vortex-lattice method is not limited in application as long as convection dominates vorticity diffusion. A non-linear 3-D vortex-lattice method was developed which treats the steady separated flow over prolate bodies with open separation moving through an inviscid incompressible fluid. The strength and position of the body wake were found as part of the solution. Flows with smooth-surface separation were considered as opposed to flows with sharp-edge separation treated with the vortex-lattice concept in the past. Results for flow over an inclined ogive-cylinder demonstrated the technique. For attached flow, comparisons are presented of the results from the vortex-lattice method using optimal and average control point locations with the results of the source-distribution method and with experimental data. The same panel arrangement was used calculating both methods. The results of the present method are somewhat more sensitive to panel arrangement than are those for the source-distribution method. Also, the effect of control point location varies dramatically as the incidence of the body is changed. For separated flow, results of the vortex-lattice method were compared with experimental data and with the results of a typical 2-D analogy. The present method agrees favorably with the experimental data windward of a separation line. GRA

**TURBINE ENGINE HOT SECTION TECHNOLOGY (HOST)**
Oct. 1983 250 p refs Workshop held in Cleveland, Ohio, 25-26 Oct. 1983
(NASA-CP-2289; E-1816; NAS 1.55:2289) Avail: NTIS HC A11/MF A01 CSCL 21E

A two-day workshop on the research and plans for turbine engine hot section durability problems was held on October 25 and 26, 1983, at the NASA Lewis Research Center. Presentations were made during six sessions, including structural analysis, fatigue and fracture, surface protective coatings, combustion, turbine heat transfer, and instrumentation, that dealt with the thermal and fluid environment around liners, blades, and vanes, and with material coatings, constitutive behavior, stress-strain response, and life prediction methods for the three components. The principal objective of each session was to disseminate the research results to date, along with future plans, in each of the six areas. Contract and government researchers presented results of their work.

Avail: NTIS HC A11/MF A01 CSCL 14B

The HOST Instrumentation R&D program is focused on two categories of instrumentation. One category is that required to characterize the environment imposed on the hot section components of turbine engines. This category includes instruments for measuring gas flow, gas temperature, and heat flux. The second category is that for measuring the effect of the environment on the hot section components. This category includes strain measuring instruments and an optical system for viewing the interior of an operating combustor to detect cracks, buckling, carbon buildup, etc. G.L.C.

**HOT SECTION VIEWING SYSTEM**
W. W. MOREY *In* NASA. Lewis Research Center Turbine Eng. Hot Sect. Technol. (HOST) p 11-16 Oct. 1983
Avail: NTIS HC A11/MF A01 CSCL 14B

The objective of the hot section viewing program is to develop a prototype optical system for viewing the interior of a gas turbine combustor during high temperature, high pressure operation in order to produce a visual record of some causes of premature hot section failures. The program began by identifying and analyzing system designs that would provide clearest images while being able to survive the hostile environment inside the combustion chamber. Different illumination methods and computer techniques for image enhancement and analysis were examined during a preliminary test phase. In the final phase of the program the prototype system was designed and fabricated and is currently being tested on a high pressure combustor rig. G.L.C.

**DYNAMIC GAS TEMPERATURE MEASUREMENT SYSTEM**

D. L. ELMORE, W. W. ROBINSON, and W. B. WATKINS *In* NASA. Lewis Research Center Turbine Eng. Hot Sect. Technol. (HOST) p 17-35 Oct. 1983 refs
(Contract NAS3-23154)
Avail: NTIS HC A11/MF A01 CSCL 14B

A gas temperature measurement system with compensated frequency response of 1 KHz and capability to operate in the exhaust of a gas turbine combustor was developed. Environmental guidelines for this measurement are presented, followed by a preliminary design of the selected measurement method. Transient thermal conduction effects were identified as important; a preliminary finite-element conduction model quantified the errors expected by neglecting conduction. A compensation method was developed to account for effects of conduction and convection. This method was verified in analog electrical simulations, and used to compensate dynamic temperature data from a laboratory combustor and a gas turbine engine. Detailed data compensations are presented. Analysis of error sources in the method were done to derive confidence levels for the compensated data. G.L.C.

**HIGH TEMPERATURE STATIC STRAIN SENSOR DEVELOPMENT PROGRAM**

C. HULSE, R. BAILEY, and H. GRANT (Pratt and Whitney Aircraft Group, East Hartford, Conn.) *In* NASA. Lewis Research Center Turbine Eng. Hot Sect. Technol. (HOST) p 37-40 Oct. 1983
(Contract NAS3-23722)
Avail: NTIS HC A11/MF A01 CSCL 14B

Electrical resistance strain gages useful for static strain measurements on nickel or cobalt superalloy parts inside a gas turbine engine on a test stand are being developed. Measurements of this type are of great importance in meeting the goals of the HOST program because, without reliable knowledge of the stresses and strains which exist in specific components, it will be difficult to fully appreciate where improvements in design and materials can be implemented. The first part of the effort consisted of a strain gage alloy development program which will be followed by an investigation of complete strain gage systems which will use the best of the alloys developed together with other system improvements. G.L.C.

**DEVELOPMENT OF HEAT FLUX SENSORS FOR TURBINE AIRFOILS AND COMBUSTOR LINERS**

W. H. ATKINSON *In* NASA. Lewis Research Center Turbine Eng. Hot Sect. Technol. (HOST) p 45-55 Oct. 1983 refs
Avail: NTIS HC A11/MF A01 CSCL 14B

The design of durable turbine airfoils that use a minimum amount of cooling air requires knowledge of the heat loads on the airfoils during engine operation. Measurement of these heat loads will permit the verification or modification of the analytical models used in the design process and will improve the ability to predict and confirm the thermal performance of turbine airfoil designs. Heat flux sensors for turbine blades and vanes must be compatible with the cast nickel-base and cobalt-base materials used in their fabrication and will need to operate in a hostile environment with regard to temperature, pressure and thermal cycling. There is also a need to miniaturize the sensors to obtain measurements without perturbing the heat flows that are to be measured. G.L.C.

**ASSESSMENT OF A 3-D BOUNDARY LAYER CODE TO PREDICT HEAT TRANSFER AND FLOW LOSSES IN A TURBINE**

V. N. VATSA *In* NASA. Lewis Research Center Turbine Eng. Hot Sect. Technol. (HOST) p 101-106 Oct. 1983 refs
(Contract NAS3-23716)
Avail: NTIS HC A11/MF A01 CSCL 20D

The prediction of the complete flow field in a turbine passage is an extremely difficult task due to the complex three dimensional pattern which contains separation and attachment lines, a saddle point and horseshoe vortex. Whereas, in principle such a problem can be solved using full Navier-Stokes equations, in reality methods based on a Navier-Stokes solution procedure encounter difficulty in accurately predicting surface quantities (e.g., heat transfer) due to grid limitations imposed by the speed and size of the existing computers. On the other hand the overall problem is strongly three dimensional and too complex to be analyzed by the current design methods based on inviscid and/or viscous strip theories. Thus there is a strong need for enhancing the current prediction techniques through inclusion of 3-D viscous effects. A potentially simple and cost effective way to achieve this is to use a prediction method based on three dimensional boundary layer (3-DBL) theory. The major objective of this program is to assess the applicability of such a 3-DBL approach for the prediction of heat loads, boundary layer growth, pressure losses and streamline skewing in critical areas of a turbine passage. A brief discussion of the physical problem addressed here along with the overall approach is presented. Author

**COOLANT PASSAGE HEAT TRANSFER WITH ROTATION. A PROGRESS REPORT ON THE COMPUTATIONAL ASPECTS**

L. D. ACETO and G. J. STURGESS *In* NASA. Lewis Research Center Turbine Eng. Hot Sect. Technol. (HOST) p 111-116 Oct. 1983 refs

Avail: NTIS HC A11/MF A01 CSCL 20D

Turbine airfoils are subjected to increasingly higher heat loads which escalate the cooling requirements in order to satisfy life goals for the component materials. If turbine efficiency is to be maintained, however, cooling requirements should be as low as possible. To keep the quantity of cooling air bounded, a more efficient internal cooling scheme must be developed. One approach is to employ airfoils with multipass cooling passages that contain devices to augment internal heat transfer while limiting pressure drop. Design experience with multipass cooling passage airfoils has shown that a surplus of cooling air must be provided as a margin of safety. This increased cooling air leads to a performance penalty. Reliable methods for predicting the internal thermal and aerodynamic performance of multipass cooling passage airfoils would reduce or eliminate the need for the safety margin of surplus cooling air. The objective of the program is to develop and verify improved analytical methods that will form the basis for design technology which will result in efficient turbine components with improved durability without sacrificing performance. The objective will be met by: (1) establishing a comprehensive experimental data base that can form the basis of an empirical design system; (2) developing computational fluid dynamic techniques; and (3) analyzing the information in the data base with both phenomenological modeling and mathematical modeling to derive a suitable design and analysis procedure. **JET ARRAY IMPINGEMENT HEAT TRANSFER CHARACTERISTICS**

L. W. FLORSCHUETZ and D. E. METZGER *In* NASA. Lewis Research Center Turbine Eng. Hot Sect. Technol. (HOST) p 117-128 Oct. 1983 refs

Avail: NTIS HC A11/MF A01 CSCL 20D

Two dimensional arrays of circular air jets impinging on a heat transfer surface parallel to the jet orifice plate are considered. The jet flow, after impingement, is constrained to exit in a single direction along the channel formed by the jet orifice plate and the heat transfer surface. In addition to the crossflow which originates from the jets following impingement, an initial crossflow is present which approaches the array through an upstream extension of the channel. The configurations considered are intended to model the impingement cooled midchord region of gas turbine airfoils in cases where an initial crossflow is also present. A major objective is determination of the effect of initial crossflow air temperature relative to jet array air temperature on impingement surface heat fluxes. Author

**BURNER LINER THERMAL/STRUCTURAL LOAD MODELLING**

R. J. MAFFEO *In* NASA. Lewis Research Center Turbine Eng. Hot Sect. Technol. (HOST) p 159-163 Oct. 1983

(Contract NAS3-23272)

Avail: NTIS HC A11/MF A01 CSCL 20K

The objective of this program is to develop a thermal data transfer computer program module for the burner liner thermal structural load modeling program. This will be accomplished by (1) reviewing existing methodologies for thermal data transfer and selecting three heat transfer codes for application in this program (2) evaluating the selected codes to establish criteria for developing a computer program module to transfer thermal data from the heat transfer codes to selected stress analysis codes; (3) developing the automated thermal load transfer module; and (4) verifying and documenting the module. In aircraft turbine engine hot section components, cyclic thermal stresses are the most important damage mechanism. Consequently, accurate and reliable prediction of thermal loads is essential to improving durability. To achieve this goal, a considerable effort over the past 20 years has been devoted to the acquisition of engine temperature test data, as well as the development of accurate, reliable, and efficient computer codes for the prediction of steady state and transient temperatures and for the calculation of elastic and inelastic cyclic stresses and strains in hot section components. There is a need for continued development of these codes, because the availability of more accurate analysis techniques for complex configurations has enabled engine designers to use more sophisticated designs to achieve higher cycle efficiency and reduce weight. **HOST LINER CYCLIC FACILITIES**

D. SCHULTZ *In its* Turbine Eng. Hot Sect. Technol. (HOST) p 195-204 Oct. 1983

Avail: NTIS HC A11/MF A01 CSCL 20K

The HOST Liner Cyclic Program is utilizing two types of test apparatus, rectangular box rigs and a full annular rig. To date two quartz lamp cyclic box rigs have been tested and a third is to begin testing in late October 1983. The box rigs are used to evaluate 5x8 inch rectangular linear samples. A 21 inch diameter outer liner simulator is also being built up for testing beginning in April 1984. All rigs are atmospheric rigs. The first box rig, a three 6-kVA lamp installation, was operated under adverse conditions to determine feasibility of using quartz lamps for cyclic testing. This work was done in December 1981 and looked promising. The second box rig, again using three 6-kVA lamps, was operated to obtain instrumentation durability information and initial data input to a Finite Element Model. This limited test program was conducted in August 1983. Five test plates were run. Instrumentation consisted of strain gages, thermocouples and thermal paint. The strain gages were found to fail at 1200 F as expected though plates were

heated to 1700 F. The third box rig, containing four 6-kVA lamps, is in build up for testing to begin in late October 1983. In addition to 33 percent greater power input, this rig has provision for 400 F backside line cooling air and a viewing port suitable for IR camera viewing. The casing is also water cooled for extended durability.

**LIFE PREDICTION AND CONSTITUTIVE BEHAVIOR**
G. R. HALFORD *In its* Turbine Eng. Hot Sect. Technol. (HOST) p 205-207 Oct. 1983
Avail: NTIS HC A11/MF A01 CSCL 20K

One of the primary drivers that prompted the initiation of the hot section technology (HOST) program was the recognized need for improved cyclic durability of costly hot section components. All too frequently, fatigue in one form or another was directly responsible for the less than desired durability, and prospects for the future weren't going to improve unless a significant effort was mounted to increase our knowledge and understanding of the elements governing cyclic crack initiation and propagation lifetime. Certainly one of the important factors is the ability to perform accurate structural stress-strain analyses on a routine basis to determine the magnitudes of the localized stresses and strains since it is these localized conditions that govern the initiation and crack growth processes. Developing the ability to more accurately predict crack initiation lifetimes and cyclic crack growth rates for the complex loading conditions found in turbine engine hot sections is of course the ultimate goal of the life prediction research efforts. It has been found convenient to divide the research efforts into those dealing with nominally isotropic and anisotropic alloys; the latter for application to directionally solidified and single crystal turbine blades.

**CREEP FATIGUE LIFE PREDICTION FOR ENGINE HOT SECTION MATERIALS (ISOTROPIC)**
V. MORENO *In* NASA. Lewis Research Center Turbine Eng. Hot Sect. Technol. (HOST) p 209-210 Oct. 1983
(Contract NAS3-23288)
Avail: NTIS HC A11/MF A01 CSCL 20K

The activities performed during the first year of the NASA HOST Program, Creep Fatigue Life Prediction for Engine Hot Section Materials (Isotropic), being conducted by Pratt & Whitney Aircraft are summarized. The program is a 5 year, two part effort aimed at improving the high temperature crack initiation prediction technology for gas turbine hot section components. Significant results of the program produced thus far are discussed. Cast B1900 + Hf and wrought IN 718 were selected as the base and alternate materials, respectively. A single heat of B1900 + Hf was obtained and test specimens fabricated. The material was characterized with respect to grain size, gamma prime size, carbide distribution, and dislocation density. Monotonic tensile and creep testing has shown engineering properties within anticipated scatter for this material. Examination of the tensile tests has shown a transition from inhomogeneous planar slip within the grains at lower temperatures to more homogeneous matrix deformation. Examination of the creep tests has shown a transgranular failure mode at 1400 F and an intergranular failure mode at 1600 F and 1800 F.

**A STUDY OF THE CORNERING FORCES GENERATED BY AIRCRAFT TIRES ON A TILTED, FREE-SWIVELING NOSE GEAR**
R. H. DAUGHERTY and S. M. STUBBS Oct. 1985 30 p refs
(NASA-TP-2481; L-15954; NAS 1.60:2481) Avail: NTIS HC A03/MF A01 CSCL 20K

An experimental investigation was conducted to study the effect of various parameters on the cornering forces produced by a rolling aircraft tire installed on a tilted, free-swiveling nose gear. The parameters studied included tilt angle, trial, tire inflation pressure, rake angle, vertical load, and whether or not a twin tire configuration corotates. These parameters were evaluated by measuring the cornering force produced by an aircraft tire installed on the nose gear of a modified vehicle as it was towed slowly. Cornering force coefficient increased with increasing tilt angle. Increasing trial or rake angle decreased the magnitude of the cornering force coefficient. Tire inflation pressure had no effect on the cornering force coefficient. Increasing vertical load decreased the cornering force coefficient. When the tires of a twin tire system rotated independently, the cornering force coefficients were the same as those for the single-tire configuration. When the twin tire system was made to corotate, however, the cornering force coefficients increased significantly.

(Contract DA PROJ. 1L1-62209-AH-76)
(NASA-TM-86440; NAS 1.15:86440; USAAVSCOM-TM-85-B-5)
Avail: NTIS HC A02/MF A01 CSCL 20K

Wind-tunnel testing of a properly scaled aeroelastic model helicopter rotor is considered a necessary phase in the design development of new or existing rotor systems. For this reason, extensive testing of aeroelastically scaled model rotors is done in the Transonic Dynamics Tunnel (TDT) located at the NASA Langley Research Center. A unique capability of this facility, which enables proper dynamic scaling, is the use of Freon as a test medium. A description of the TDT and a discussion of the benefits of using Freon as a test medium are presented. A description of the model test bed used, the Aeroelastic Rotor Experimental System (ARES), is also provided and examples of recent rotor tests are cited to illustrate the advantages and capabilities of aeroelastic model rotor testing in the TDT. The importance of proper dynamic scaling in identifying and solving rotorcraft aeroelastic problems, and the importance of aeroelastic testing of model rotor systems in the design of advanced rotor systems are demonstrated.

A hybrid spar of titanium with an integrally brazed composite, consisting of an aluminum matrix reinforced with boron-carbide-coated fibers, was heated in an oven and the resulting thermal stresses were measured. Uniform heating of the spar in an oven resulted in thermal stresses arising from the effects of dissimilar materials and anisotropy of the metal matrix composite. Thermal stresses were calculated from a finite element structural model using anisotropic material properties deduced from constituent properties and rules of mixtures. Comparisons of calculated thermal stresses with measured thermal stresses on the spar are presented. It was shown that failure to account for anistropy in the metal matrix composite elements would result in large errors in correlating measured and calculated thermal stresses. It was concluded that very strong material characterization efforts are required to predict accurate thermal stresses in anisotropic composite structures. Author

**COMPUTATIONAL STRUCTURAL MECHANICS: A NEW ACTIVITY AT THE NASA LANGLEY RESEARCH CENTER**

N. F. KNIGHT, JR. and W. J. STROUD Sep. 1985 39 p refs
Presented at 22nd Ann. Tech. Meeting of the Soc. of Eng. Sci., University Park, Pa., 7-9 Oct. 1985
(NASA-TM-87612; NAS 1.15:87612) Avail: NTIS HC A03/MF A01 CSCL 20K

Complex structures considered for the late 1980's and early 1990's include composite primary aircraft structure and the space station. These structures will be much more difficult to analyze than today's structures and necessitate a major upgrade in computerized structural analysis technology. A new research activity in structural analysis, the computational structural mechanics (CSM) was initiated. The objective of the CSM activity is to develop advanced structural analysis technology that will exploit modern and emerging computers such as computers with vector and/or parallel processing capabilities. The three main research activities underway in CSM include: (1) structural analysis methods development; (2) a software testbed for evaluating the methods; and (3) numerical techniques for parallel processing computers. The motivation and objectives of the CSM activity are presented and CSM activity is described. The current CSM research thrusts, and near and long term CSM research thrusts are outlined. E.A.K.

**SMALL FORMAT MICROLIGHT SURVEYS**

R. W. GRAHAM (Aerial Imaging Systems, Ltd., Amersham, England), R. E. READ, and J. KURE (International Institute for Aerial Survey and Earth Sciences, Enschede, Netherlands) ITC Journal (ISSN 0303-2434), no. 1, 1985, p. 14-20.

Conventional survey aircraft are designed to meet photogrammetric requirements of mapping. For less exacting coverage, where metric accuracy is not important, there is an urgent need for a more economical and appropriate method of obtaining primary data. This article summarizes the results of research on small format microlight surveys (SFMS)-including the types of aircraft, types of camera, various lenses and films-in an attempt to evaluate SFMS for use in urban and earth resource surveys. **THE EFFECT OF CHANGES IN AIRCRAFT NOISE EXPOSURE**

G. J. RAW and I. D. GRIFFITHS (Surrey, University, Guildford, England) Journal of Sound and Vibration (ISSN 0022-460X), vol. 101, July 22, 1985, p. 273-275. Research supported by the Economic and Social Research Council.

Langdon and Griffiths (1982) have presented evidence that decreases in road traffic noise have a greater beneficial effect on annoyance caused by noise than would be predicted from a function derived from studies of steady state noise conditions. The same type of study has now been applied to aircraft noise using a regression analysis. It was found that an increase or decrease in aircraft noise results in a change in annoyance over 50 percent greater than would be predicted by using the steady state regression line. Hence, the change itself has an important effect in addition to the effect of the final noise level reached. C.D.

**ROTARY-WING OPERATIONS IN A MICROBURST ENVIRONMENT**

E. E. MACE Apr. 1985 43 p
(AD-A156695; ACSC-85-1670) Avail: NTIS HC A03/MF A01 CSCL 04B

Microburst wind shear has been directly or indirectly involved in 28 aircraft incidents or accidents since 1964. Following the last major aircraft accident attributed to microburst wind shear in 1982, a major effort was undertaken to study the hazard. The majority of the work that has been accomplished deals with the publicity of the phenomenon to the aviation community and with acceptable methods of detecting it before it occurs. This study explores the background, detection systems and special considerations of helicopter operations in relation to microburst induced wind shear. Included are subjective hazards, aircraft response and recommended pilot actions to successfully penetrate the wind shear if inadvertently encountered. The study recommends that it be used as an interim measure to supplement existing microburst wind shear information and that additional helicopter microburst testing be conducted. Author (GRA)

**A NEW CHARACTERIZATION OF THE ICING ENVIRONMENT BELOW 10,000 FEET AGL FROM 7,000 MILES OF MEASUREMENTS IN SUPERCOOLED CLOUDS**
R. K. JECK *In* NASA. Marshall Space Flight Center Meteorol. and Environ. Inputs to Aviation Systems p 51-55 Sep. 1985 refs
Avail: NTIS HC A07/MF A01 CSCL 04B

A growing requirement over the past decade for a new assessment of aircraft icing conditions in wintertime clouds at altitudes up to about 10,000 feet is discussed. The requirement was documented in past workshops and comes primarily from the helicopter community which wants ice-protected rotorcraft to meet increasing demands for all-weather operations. Currently, only a few of the larger helicopters are equipped with certification of ice-protection devices. This is because the current FAA criteria for design and certification of ice-protection equipment results in power and payload penalties that smaller rotorcraft cannot tolerate. The FAA criteria were actually designed for large, transport-category aircraft capable of flying to 20,000 feet or more. For this reason, there have been concerns that the current criteria may be too severe for low-performance aircraft, such as helicopters, which generally operate at altitudes below 10,000 feet. **ADVANCE PARTICLE AND DOPPLER MEASUREMENT METHODS**

C. BUSCH *In* NASA. Marshall Space Flight Center Meteorol. and Environ. Inputs to Aviation Systems p 61-62 Sep. 1985
Avail: NTIS HC A07/MF A01 CSCL 04B

Particle environments, i.e., rain, ice, and snow particles are discussed. Two types of particles addressed are: (1) the natural environment in which airplanes fly and conduct test flights; and (2) simulation environments that are encountered in ground-test facilities such as wind tunnels, ranges, etc. There are characteristics of the natural environment that one wishes to measure. The liquid water content (LWC) is the one that seems to be of most importance; size distribution may be of importance in some applications. Like snow, the shape of the particle may be an important parameter to measure. As one goes on to environment in simulated tests, additional parameters may be required such as velocity distribution, the velocity lag of the particle relative to the aerodynamic flow, and the trajectory of the particle as it goes through the aerodynamic flow and impacts on the test object. G.L.C.

**FINITE WORDLENGTH DESIGN OF DIGITAL KALMAN FILTERS FOR STATE ESTIMATION**

D. WILLIAMSON (New South Wales, University, Kensington, Australia) IEEE Transactions on Automatic Control (ISSN 0018-9286), vol. AC-30, Oct. 1985, p. 930-939. refs

The optimal design of a Kalman filter is considered with respect to its finite wordlength (FWL) characteristics taking into account the roundoff noise due to state quantization. The issues are particularly relevant in the design of FWL Kalman filters for continuous-time systems operating under a fast sampling rate. In this respect, the results demonstrate one compromise between the selection of the sampling rate and the selection of the state wordlength. The optimum filter structure includes state residue feedback compensation which can result in the saving of many bits of additional state wordlength. Author

**STOCHASTIC DYNAMIC SYSTEM SUBOPTIMAL CONTROL WITH UNCERTAIN PARAMETERS**

M. H. LEE, W. J. KOLODZIEJ, and R. R. MOHLER (Oregon State University, Corvallis) IEEE Transactions on Aerospace and Electronic Systems (ISSN 0018-9251), vol. AES-21, Sept. 1985, p. 594-600. refs
(Contract N00014-81-K-0814)

The control of a linear system with random coefficients is studied here. The cost function is of a quadratic form and the random coefficients are assumed to be partially observable by the controller. By means of the stochastic Bellman equation, the optimal control of stochastic dynamic models with partially observable coefficients is derived. The optimal control is shown to be a linear function of the observable states and a nonlinear function of random parameters. The theory is applied to an optimal control design of an aircraft landing in wind gust. Author

**LOGISTICS CONSIDERATIONS FOR DESIGN ENGINEERS**

F. J. LAUBER (McDonnell Douglas Astronautics Co., St. Louis, MO) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 6 p.
(AIAA PAPER 85-3056)

Designers of weapon systems are facing new government emphasis on providing readiness and support for new designs at an affordable and balanced life-cycle cost. Readiness and support will now receive comparable emphasis with performance, cost and schedule as a criterion for evaluating programs. To help designers adjust to this new emphasis, this paper defines logistic support, describes associated costs for operating and supporting weapon systems, and identifies the timing required to integrate support considerations into the design process. With this knowledge, designers can call for logistics assistance in the same manner that they now call for other Systems Engineering expertise to optimize the final design configuration. Author

**PAN AIR CONSULTATIONS USING EXPERT SYSTEM TECHNIQUES**

R. S. CONNER (Boeing Military Airplane Co., Seattle, WA), D. J. PURDON (Boeing Computer Services Co., Seattle, WA), and F. K. WAMSLEY (Asymetrix Corp., Bellevue, WA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 7 p. refs
(AIAA PAPER 85-4094)

Expert system techniques are proposed to aid aircraft design engineers who run the PAN AIR program within the constraints of a project environment. Expert systems are programs which mimic human problem solving by performing symbolic computations. Performing all the tasks associated with running PAN AIR would require knowledge of proper geometric modeling, program input options and output analysis methods. A prototype of a program input option expert system was built. It demonstrates a very user friendly interface to the code by querying the user about the problem in general terms and translating the responses into a PAN AIR input deck. Author

**A86-11123**

**MATCHED PROCESSORS FOR QUANTIZED CONTROL - A PRACTICAL PARALLEL-PROCESSING APPROACH**

E. H. FERIA (College of Staten Island, NY) International Journal of Control (ISSN 0020-7179), vol. 42, Sept. 1985, p. 695-713. refs

Deterministic 'quantized control' problems are investigated from a novel and often computationally feasible 'matched processors' (MPs) perspective. It is noted that a bank of independent MPs, each matched to an admissible decision sequence, can evaluate, given the state and remaining duration, the dynamic performance cost-to-go values corresponding to a suitably selected 'small' subset of all admissible decision sequences. By choosing the best admissible decision sequence in this subset and using its first decision at each stage a computationally feasible and generally suboptimum MP control scheme is produced. This scheme is found to be ideally suited for very-large-scale integration. In particular, for processes that are linear in the state and performance criteria that are quadratic in the state, the cost-to-go reduces to a simple quadratic function of the given state which in turn results in an MP control scheme structure similar to offered VLSI-based digital computers. It is demonstrated that the proposed scheme performs quite well in two experimental examples. Author

**MULTITASK SCHEDULING FOR TIME-CRITICAL APPLICATIONS**

J. F. READY (Hunter and Ready, Inc., Palo Alto, CA) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 294-304.
(AIAA PAPER 85-6008)

A hierarchy of control loops is employed as an example to demonstrate the most efficient software methodology for testing synchronous, hybrid, and asynchronous (C3I and EW) time-critical avionics applications. It is noted that, as the cyclic control loops increase in complexity, the software must become aware of multiple functions and the priorities of such functions, which leads to a consideration of a multitasking methodology as a practical solution. Illustrations including code examples in Ada are presented which provide a step-by-step guide through the subject of multitask scheduling for time-critical applications. B.J

### SOFTCOST - A USER-FRIENDLY SOFTWARE COST ESTIMATION TOOL

D. J. REIFER and M. H. HILL (Reifer Consultants, Inc., Torrance, CA) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 305-313. refs
(AIAA PAPER 85-6009)

The SoftCost estimating tool, its features, and initial user experiences with it in operational environments are described. SoftCost is a software system that integrates a powerful screen editor, a hybrid parametric software estimation model, and a flexible report generator with Gantt/PERT charting capabilities into an user-friendly environment where software project costs can be estimated quickly and accurately under a wide variety of situations. The tool builds on both the strengths and weaknesses of other similar packages available in the public domain. These features and SoftCost's approach to interfacing with the management user are explained in depth as the paper relates how the tool's goals of user-friendliness, fidelity, and flexibility were achieved in the tool's design. Initial experiences with the tool on both military and commercial projects are described. Author

### BOEING STRESS ANALYSIS WORKSTATION DEVELOPMENT

D. C. JACK and F. GAMA-LOBO (Boeing Co., Seattle, WA) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 349-354.
(AIAA PAPER 85-6014)

With the increased design productivity resulting from a CAD/CAM environment, it is evident that traditional hand methods of strength checking airframe structures are rapidly becoming inadequate. This paper describes the development of a pilot stress analysis workstation program which, using a MASSCOMP MC500 workstation, takes full advantage of today's microcomputer capability to address this situation. The stress workstation fully synthesizes the digital product definition, the mainframe internal loads analysis, and classical ultimate, fatigue and damage tolerance strength-checks into a user-friendly, integrated system. The system uses modern data base management and graphic display techniques to provide the analyst with a real-time comprehensive analysis with an innovative informative display of results which parallels the current stress analysis. Requirements, program design and structure, and engineering acceptance are discussed in detail. Author

**A86-11450#**

### PREDICATE/TRANSITION NETWORK ANALYSIS OF REDUNDANT CHANNEL SYNCHRONIZATION

L. A. BARTON, D. B. MULCARE, L. E. DOWNING (Lockheed-Georgia Co., Marietta), and R. J. LEBLANC (Georgia Institute of Technology, Atlanta) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 374-379.
(AIAA PAPER 85-6020)

The predicate/transition network analysis technique provides a powerful tool for modeling and analyzing concurrent systems with discrete states. In a recent project, a predicate/transition network was used to model the cross-channel synchronization design for a quadruplex digital flight control system (DFCS). An analysis program was developed and applied in exercising the network to confirm its proper operation, i.e., its correct sequencing of state transitions. This tool was then extended by the use of Ada tasking to a time-based simulation that permits the inclusion of nonideal timing effects that tend to be present in practical systems. Although it possesses more general utility, the predicate/transition network analysis program has provided the capacity to rigorously verify DFCS designs on an analytical basis, rather than by trial and error methods such as breadboarding. Its development has also afforded considerable design and programming experience with the Ada programming language, especially with regard to applications of tasking, which have been found to be particularly well suited to time-based simulations. ### PERFORMANCE ANALYSIS OF A FAULT INFERRING NONLINEAR DETECTION SYSTEM ALGORITHM WITH INTEGRATED AVIONICS FLIGHT DATA

A. K. CAGLAYAN, P. M. GODIWALA (Charles River Analytics, Inc., Cambridge, MA), and F. R. MORREL (NASA, Langley Research Center, Hampton, VA) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 391-398. refs
(AIAA PAPER 85-6022)

This paper presents the performance analysis results of a fault inferring nonlinear detection system (FINDS) using integrated avionics sensor flight data for the NASA ATOPS B-737 aircraft in a Microwave Landing System (MLS) environment. First, an overview of the FINDS algorithm structure is given. Then, aircraft state estimate time histories and statistics for the flight data sensors are discussed. This is followed by an explanation of modifications made to the detection and decision functions in FINDS to improve false alarm and failure detection performance. Next, the failure detection and false alarm performance of the FINDS algorithm are analyzed by injecting bias failures into fourteen sensor outputs over six repetitive runs of the five minutes of flight data. Results indicate that the detection speed, failure level estimation, and false alarm performance show a marked improvement over the previously reported simulation runs. In agreement with earlier results, detection speed is faster for filter measurement sensors such as MLS than for filter input sensors such as flight control accelerometers. Finally, the progress in modifications of the FINDS algorithm design to accommodate flight computer constraints is discussed. Author

### ALGEBRAIC POLYNOMIAL APPROXIMATION IN THE LSQ SENSE OF A FAMILY OF CURVES

C. P. NEHRA (Allied/Bendix Aerospace Sector, Bendix Flight Systems Div., Teterboro, NJ) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 416-421.
(AIAA PAPER 85-6026)

An algorithm to derive an algebraic polynomial approximation in the LSQ sense for a family of curves generated by an n-dimensional function of form G(x,y,z...) is developed with reference to the design of embedded processor real-time systems. The algorithm has been used to approximate a family of curves representing: (1) the maximum range of an aircraft, which is a function of true air speed, altitude, and outside air temperature; and (2) damped sinusoids with the independent variables time, damping factor, and frequency. B.J.

### ARCHITECTURAL CONCEPTS FOR INTEGRATED REALTIME MULTIPROCESSORS

G. W. GRUBE, W. W. SCALES, and D. P. WILLIAMS (AT&T Bell Laboratories, Whippany, NJ) IN: Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers . New York, AIAA, 1985, p. 474-477. refs
(AIAA PAPER 85-5053)

Methodology and architectural concepts at the system level for real-time microprocessor systems are examined with particular reference to multiprocessors for aerospace platforms. Data-flow multiprocessor architectures are illustrated by two examples, the Enhanced Modular Signal Processor and the AT&T Bell Laboratories' Data Flow Architecture. It is pointed out that the system architecture is strongly influenced by such nonfunctional requirements as reliability, fault tolerance, programmability, and modularity. V.L.

This thesis examines the use of an artificial intelligence technique, hierarchical planning, to solve the problem of generating an aircraft route and finding a path through various hostile environments. A route or path is evaluated by the number and type of threats the aircraft encounters on the route and the route length. An algorithm using hierarchical planning is presented and tested against several hostile environments. Specifically, the algorithms will divide the problem space or grid into smaller spaces or boxes. These boxes are then assigned values based upon the input hostile environment. Block paths are then constructed and evaluated based on the values in the boxes. An exhaustive search is performed on the two best block paths to find a flight path for the aircraft. Test results are compared to previous results obtained using heuristic search and indicate an improvement in solution quality. Although specific plans are incorporated into the algorithm to obtain test results, many other plans within the realm of hierarchical planning certainly exist and could be used to solve this problem. The recent advances in computer technology which impact present and future Air Force systems led the Air Force Academy to include computers and information systems engineering courses in the curriculum. This analysis addresses the issue of a major in computer engineering at the Academy. The Air Force computer engineer (AFSCs 2625, 2736 and 2885) specializes in designing, developing, installing, and testing embedded computer systems in aircraft, missiles, flight simulators, and command, control, and communications systems. An embedded computer system is all computer equipment, programs, data, documentation, personnel, and supplies integral to a defense system from the design, acquisition, or operations and support point of view. This report addresses the Air Force need for computer engineers, the need for the computer engineering major at the Academy, the appropriate department to administer the major, the structure of the degree, and the implementation of the discipline at the Academy. **THE GENERATION OF NOISE IN IMPINGING VORTEX MOTION PAST A STEP**
A. T. CONLISK and D. VELEY (Ohio State University, Columbus) Physics of Fluids (ISSN 0031-9171), vol. 28, Oct. 1985, p. 3004-3012. Research supported by the Ohio State University. refs

The noise field generated by the motion of one, two, or several rectilinear vortices in an inviscid, irrotational mean flow past a step is considered for low Mach number. The streakline patterns of an impinging vortex are compared with flow visualization studies, and qualitative agreement between the present analytical results and the experiments is achieved. Both acoustic pressure and intensity are strong functions of the vortex motion near the step which, because of the complexity of the geometry, must be

computed numerically. Results for the acoustic pressure and intensity are presented for a variety of incident vortex arrays.

**HELICOPTER NOISE**
R. LEGENDRE (ONERA, Chatillon-sous-Bagneux, France) La Recherche Aerospatiale (English Edition) (ISSN 0379-380X), no. 6, 1984, p. 59-61.

The state of the art in predicting and modeling helicopter noise, its sources, components, magnitudes and dynamic characteristics, is assessed. Noise is not emitted by steady flow, and can be decomposed into noise and pseudo-noise. Account must be taken of pseudo-noise in considerations of passenger comfort. The evolution of vortices in the turbulent boundary layer, the turbulent wake and at the blade tips produces noise. The difficulty in predicting noise arises from the complex behavior of vortices, atmospheric processes which affect the noise during flight and interactions among noise effects of separate blades and the fuselage noise. Various experiments are suggested for deriving quantitative laws to improve noise prediction efforts. M.S.K.

**AEROACOUSTIC WIND TUNNEL MEASUREMENTS ON PROPELLER NOISE**
F. R. GROSCHE and H. STIEWITT *In* AGARD Aerodyn. and Acoustics of Propellers 9 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01

Model tests were conducted in a low speed wind tunnel to determine the sound radiation of 5 propellers with different blade designs including variations of thickness ratios, blade profiles, blade planforms and blade tip configurations. The diameter of the propellers was 0.9 m, the propeller speed was kept constant. The tip Mach number was M sub I = 0.66 and the helical tip Mach number varied between 0.66 and 0.69. The main objectives were to investigate the effects of blade geometry on near field and far field noise and to locate the dominant sound sources in the propeller plane, radiating to the observer, by means of a highly directional microphone system. The results include: (1) comparisons of noise spectra of different propeller configurations; (2) near field sound pressures as function of axial distance from the propeller plane; and (3) directivity of sound radiation from the moving blades.

Avail: NTIS HC A20/MF A01

In flight near field propeller noise measurements, made on a General Aviation turboprop aircraft, are reported for a range of propeller operating conditions, and are shown to be well defined and reproducible. Measurements have been made at 8 exterior microphones, 2 located on a wing mounted boom, and 6 embedded in, and flush with the aircraft fuselage. Interior noise levels are also presented. Measured propeller harmonic levels are compared to first principle calculations of near field noise, using a modified version of the Farassat computer program, in which the blade surface pressure is described using the known aerodynamic properties of the blade (NACA 16) airfoil sections. The first few; i.e., the dominant harmonic levels of propeller noise are shown to be well predicted, while higher harmonic levels are underpredicted. The transmission loss between exterior and interior noise levels is shown to be relatively constant for varying propeller operating conditions and at two different locations along the length of the fuselage. Interior noise levels are also shown for the aircraft in gliding flight at various forward velocities, with both engines at idle and propellers feathered. A method of interpolating these measurements is discussed, which allows the interior noise due only to the forward velocity of the aircraft, to be determined. The transmission loss for this component is also discussed. Finally, interior noise levels are presented for a series of ground static tests with engine mounts of various different stiffnessses. **FULL-SCALE FLIGHT AND MODEL-SCALE WIND TUNNEL TESTS ON THE NEARFIELD NOISE CHARACTERISTICS OF AIRCRAFT PROPELLERS**
H. HELLER, M. KALLERGIS, and B. GEHLHAR *In* AGARD Aerodyn. and Acoustics of Propellers 17 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01

Flight noise tests employing a single engine Cessna T 207 aircraft with an array of wing mounted microphones were conducted to investigate nearfield acoustic characteristics of a 3 blade variable pitch propeller under different operational conditions, varying helical blade tip Mach number, propeller advance ratio, and blade loading. A special technique to minimize the engine exhaust influence on the propeller signature had been developed for this purpose. Supplementary, yet much more extensive tenth scale tests were performed in the DFVLR One Meter Acoustic Tunnel again in the acoustic nearfield of propellers with 2 to 6 blades over a substantial range or operational, partially interdependent, parameters, such as helical blade tip Mach number, blade pitch angle setting, blade incidence angle, rotational plane attitude, and ambient temperature. These data could also be compared to some third scale results for geometrically identical propellers. Especially the model tests allowed an exact quantification of the effect of the various parameters on the ensuing harmonic and subharmonic propeller noise spectra.

**CABIN NOISE REDUCTION FOR A NEW DEVELOPMENT TURBOPROP COMMUTER AIRCRAFT**
A. CARBONE, A. PAONESSA, L. LECCE (Ist. Progetto Velivoli, Naples), and F. MARULO (Ist. Progetto Velivoli, Naples) *In* AGARD Aerodyn. and Acoustics of Propellers 14 p Feb. 1985 refs
Avail: NTIS HC A20/MF A01

The program followed to attain an interior noise level similar to turbofan aircraft in a new design turboprop commuter is described. The need for an early consideration, in the definition phase of the aircraft, of the acoustic requirement for configuration development is stressed, along with some peculiar characteristics of this program. After a brief presentation of features of the aircraft related to interior noise control, the analytical and experimental models developed in the course of program are discussed. Some of the results of the studies are presented, clarifying the impact that they have had on the configuration of the aircraft. The output of three structural analysis theoretical procedures is compared to experiments. Two of these procedures, the panel stringer periodic model, and a simplified FEM analysis, are found adequate to represent experimental findings. The cylindrical shell - frame model is found not representative of test results. Sidewall treatment performance is discussed, with reference to theoretical and experimental results. The noise reductions measured in a furnished fuselage are compared to data obtained without interior treatment. Future developments and recommendations for additional work are discussed. Author

**PROPELLER AIRCRAFT CABIN VIBRATION AND NOISE-EXCITATION, SOURCES, AND PATHS**

R. E. DONHAM, F. J. BALENA, E. Z. BOCHARY, and O. K. LIEHR *In* AGARD Aerodyn. and Acoustics of Propellers 14 p Feb. 1985 refs

Avail: NTIS HC A20/MF A01

The potential sources and paths by which the propeller produces structural responses resulting in vibration and noise in the cabin of a transport aircraft are discussed. New low cost, convenient experimental and analytical techniques are described for evaluating the excitations; propeller airborne pressures on the fuselage shells, slip stream induced forces on the wing and tail, and oscillatory forces on the propeller. The techniques described make use of ground determined structural signatures to relate forces with vibrations or noise, and of propeller signatures from flight which define the vibroacoustic contributions of individual propellers. **THE STATE OF THE ART IN PROPFAN TURBOPROP NOISE**

F. B. METZGER *In* AGARD Aerodyn. and Acoustics of Propellers 20 p Feb. 1985 refs

Avail: NTIS HC A20/MF A01

The evolution of propeller noise research is summarized from 1919 to the present. The early experimental and analytical work to understand and predict propeller noise is discussed. Emphasis is placed on understanding source noise. However, the major advances in cabin comfort assessment and design of airplane fuselage and cabin trim to improve passenger comfort are briefly described. Emphasis is on the recent noise research work on the propfan, a many bladed relatively small diameter unshrouded motor with swept blades that will allow future transports to cruise efficiently at speeds equal to modern turbofan transports. The most recent propfan concept, a counter rotation version with even greater efficiency potential than the propfan with a single blade row is also discussed. Author

**APPLICATION OF ACTIVE NOISE CONTROL TO MODEL PROPELLER NOISE**

M. SALIKUDDIN, H. K. TANNA, R. H. BURRIN, and W. E. CARTER *In* AGARD Aerodyn. and Acoustics of Propellers 15 p Feb. 1985 refs

Avail: NTIS HC A20/MF A01

The applicability of active noise control to reduce cabin noise of turboprop aircraft is demonstrated by conducting several laboratory experiments. The principle of active noise control is to reduce the noise radiated from a primary source by superimposing a signal from a secondary source, which is made identical in amplitude but opposite in phase to the primary sound signal. A computer controlled algorithm was developed to implement this concept in a free field environment, in which, the noise from the primary source (eventually the propeller) and the noise measured at several locations on a representative surface (eventually the fuselage) were used to create the input for the secondary source. Experiments using a number of sinusoidal signals were conducted. An average noise reduction of 8 to 14 dB was achieved on the surface in the frequency range of 200 to 1000 Hz. Next the concept was applied to the propeller problem where the sound signal contains many discrete tones at harmonics of the blade passage frequency. For this purpose, a prerecorded time history of a 1/10th scale model propeller was used to drive the primary source. An average noise reduction of about 15 dB was observed at the first two blade passage frequencies, and 12 dB and 5 dB reductions were observed at the 3rd and 4th blade passage frequencies, respectively. Finally, the active noise control concept was applied to a 1/10th scale propeller, installed in an anechoic chamber with flight simulation facility. A substantial amount of noise reduction was achieved on the model fuselage surface. Author

K. D. KORKAN *In* NASA. Lewis Research Center Numerical Tech. in Acoustics p 9-10 Oct. 1985 refs

(Contract NAG3-354)

Avail: NTIS HC A03/MF A01 CSCL 20A

Using the transonic flow fields(s) generated by the NASPROP-E computer code for an eight blade SR3-series propeller, a theoretical method is investigated to calculate the total noise values and frequency content in the acoustic near and far field without using the Ffowcs Williams - Hawkings equation. The flow field is numerically generated using an implicit three dimensional Euler equation solver in weak conservation law form. Numerical damping is required by the differencing method for stability in three dimensions, and the influence of the damping on the calculated acoustic values is investigated. The acoustic near field is solved by integrating with respect to time the pressure oscillations induced at a stationary observer location. The acoustic far field is calculated from the near field primitive variables as generated by NASPROP-E computer code using a method involving a perturbation velocity potential as suggested by Hawkings in the calculation of the acoustic pressure time-history at a specified far field observed location. the methodologies described are valid for calculating total noise levels and are applicable to any propeller geometry for which a flow field solution is available. **GENERAL AVIATION COST EFFECTIVENESS**
R. E. ETHERINGTON (Gates Learjet Corp., Wichita, KS) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 6 p.
(AIAA PAPER 85-4029)

The General Aviation Industry has not recovered from the last economic recession in the robust manner of the industry's recovery in the 1970 time frame. Indeed, the recovery in the 1970's was so strong that the middle seventies slow down was hardly noticed. The General Aviation Industry has not recovered from the major recession of the early eighties as have the other major industries. This paper examines cost effectiveness of the General Aviation Aircraft and postulates a loss of cost effectiveness as one possible reason for the lack of recovery. A cursory look at the cost effectiveness of the aircraft in the early 70's versus the early 80's reveals a dramatic reduction in productivity represented by the index of cost per pound-mile of payload range. This reduction is well in excess of the inflation rate. This paper examines in some limited detail the causes of this loss in cost effectiveness. Author

**COST AND SCHEDULE IMPLICATIONS OF MULTINATIONAL COPRODUCTION**
M. D. RICH, W. L. STANLEY, and J. L. BIRKLER (Rand Corp., Santa Monica, CA) SAE, Aerospace Vehicle Requirements Conference, Washington, DC, May 20-23, 1985. 7 p.
(SAE PAPER 851150)

The feasibility of multinational collaboration in connection with the acquisition of tactical weapon systems is being considered by both the United States and its European allies. Reasons for an interest in such a collaboration are related to the ever-rising cost of developing and producing weapon systems, a desire to standardize weapon systems used by North Atlantic Treaty Organization nations, a desire on the part of European members to improve their defense industrial capabilities, requirements for an equitable balance of defense hardware trade, and the growing number of European firms with suitable technical capacities. Taking into account, as an example, the F-16 fighter aircraft program, an analysis is conducted to assess the impact of coproduction on acquisition costs and schedules. It is found that European prices are competitive with U.S. prices for only about one-third of the part sets considered in a sample. Some guidelines are provided for lessening the inherent difficulties of collaboration. G.R.

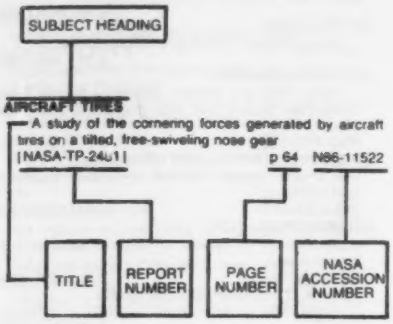
# SUBJECT INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 197)* FEBRUARY 1986

## Typical Subject Index Listing



The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

The effect of the initial temperature nonuniformity and excess air ratio of the afterburner of a gas-turbine engine on the specific pulse of the nozzle p 40 A86-12531

A study of the swirling of a liquid by porous rotors --- in aircraft engine centrifugal pumps p 40 A86-12532

A method for designing a surge protection device for gas turbine engines p 40 A86-12541

A study of the effect of rotor blading parameters on the region of acceptable design solutions for the attachment of aircraft compressor blades p 41 A86-12544

Determination of the thrust of a bypass engine under operating conditions p 41 A86-12546

A study of a turbine stage with a twisted vaned diffuser p 41 A86-12548

Unsteady operation of the fuel nozzles of the main combustion chamber of a gas-turbine engine p 41 A86-12549

AE monitoring of jet engine breech chambers p 59 A86-12561

Acoustic emission studies for detection and monitoring incipient cracks in a simulated aero engine mount under fatigue p 59 A86-12562

In-flight monitoring for incipient cracks in an aero engine mount - An approach through pattern recognition p 35 A86-12574

Assuring the reliability of aircraft engines p 41 A86-12599

Retrofit of SAC EC-135C and RC-135 aircraft with CFM-56 engines [AD-A156688] p 31 N86-10038

Current and future engine applications of Gr/PI composites p 54 N86-11291

Combustion hot section technology p 45 N86-11512

HOST structural analysis program overview p 45 N86-11513

**AIRCRAFT EQUIPMENT**

Post-2000 - The multimode aircraft system [AIAA PAPER 85-4015] p 2 A86-10952

Deputy minister on sector's technical progress p 4 N86-11178

World's largest airplane now being tested p 32 N86-11181

Chemical bonding agent for suppression of rusty bolt intermodulation interference [AD-D011747] p 54 N86-11315

**AIRCRAFT FUEL SYSTEMS**

An adhesively sealed, composite skinned wing fuel tank [AIAA PAPER 85-4023] p 23 A86-10956

**AIRCRAFT FUELS**

Summary of recent NASA propeller research p 43 N86-11158

User's manual for AC-20-53A protection of airplane fuel systems against fuel vapor ignition due to lightning [AD-A157619] p 20 N86-11191

**AIRCRAFT GUIDANCE**

Quasi-optimal on-line guidance laws for military aircraft [AIAA PAPER 85-1977] p 47 A86-12294

**AIRCRAFT HAZARDS**

Accident investigation p 20 A86-12011

Electromagnetic resonances of cylinders and aircraft model with resistive wires [NASA-CR-176250] p 32 N86-10042

Development of a wind shear performance envelope p 67 N86-11746

**AIRCRAFT INDUSTRY**

The Brazilian aircraft industry and the use of law as a tool for development p 72 A86-10274

Deputy minister on sector's technical progress p 4 N86-11178

The factory of the future p 60 N86-11228

**AIRCRAFT INSTRUMENTS**

The development of a vertical gyroscope for remotely piloted vehicle (RPV) applications p 55 A86-10372

Precise vertical speed reconstruction based on vertical acceleration and barometric altitude p 34 A86-11762

**AIRCRAFT LANDING**
Stochastic dynamic system suboptimal control with uncertain parameters p 67 A86-10191
Approach and landing thrust reverser testing in ground effect
[AIAA PAPER 85-3075] p 23 A86-10935
Runway and maneuvering performance enhanced p 29 A86-11958

**AIRCRAFT LAUNCHING DEVICES**
A novel launcher for R.P.V.s p 48 A86-10366
Launch and recovery of airborne remotely piloted vehicles p 48 A86-10367

**AIRCRAFT MAINTENANCE**
Engine performance monitoring in helicopters p 39 A86-11661
Procedures for trending aircraft gas turbine engine performance p 39 A86-11662
JT9D engine/module performance deterioration results from back to back testing p 39 A86-11663
Certain algorithms related to 'engine condition monitoring' systems p 39 A86-11664
Repair of air-cooled turbine vanes of high-performance aircraft engines - Problems and experience p 3 A86-11872
Evaluation of fault reporting/fault isolation for F-15 aircraft
[AD-A156516] p 33 N86-11197

**AIRCRAFT MANEUVERS**
An analysis of two methods for analysis of dynamic flight test manoeuvres p 45 A86-10160
Runway and maneuvering performance enhanced p 29 A86-11958
High angle of attack maneuvering probed p 29 A86-11959
Quasi-optimal on-line guidance laws for military aircraft
[AIAA PAPER 85-1977] p 47 A86-12294
Determination of the order and structure of the linear differential equations of aircraft motion from experimental results p 47 A86-12535
System modeling and identification of equivalent systems with and without compensating time delay for control-augmented aircraft
[ESA-TT-852] p 32 N86-10043
Application of the vortex-lattice concept to flows with smooth-surface separation
[AD-A157571] p 61 N86-11430

**AIRCRAFT MODELS**
An analysis of two methods for analysis of dynamic flight test manoeuvres p 45 A86-10160
Large airplane derivative development methodology
[AIAA PAPER 85-3043] p 22 A86-10926
Modeling vehicle dynamics for flying qualities studies
[AIAA PAPER 85-3062] p 46 A86-10931
Rapid sizing methods for airplanes
[AIAA PAPER 85-4031] p 24 A86-10960
Ground effect and the helicopter - A summary
[AIAA PAPER 85-4034] p 24 A86-10963
Nonlinear dynamics of a helicopter model in ground resonance p 25 A86-11154
Influence of various unsteady aerodynamic models on the aeromechanical stability of a helicopter in ground resonance p 27 A86-11164
Development and application of mathematical models of aircraft --- Russian book p 29 A86-11945
Modeling of the variable frontal stiffness of the rudder of a dynamically similar empennage model p 47 A86-12552
Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration
[NASA-TM-86782] p 17 N86-10015
Electromagnetic resonances of cylinders and aircraft model with resistive wires
[NASA-CR-176250] p 32 N86-10042
System modeling and identification of equivalent systems with and without compensating time delay for control-augmented aircraft
[ESA-TT-852] p 32 N86-10043

**AIRCRAFT NOISE**
Noise from a circulation control wing with upper surface blowing
[AIAA PAPER 85-3083] p 5 A86-10939
Helicopter noise p 71 A86-12025
The effect of changes in aircraft noise exposure p 65 A86-12447
Aerodynamics and Acoustics of Propellers
[AGARD-CP-366] p 3 N86-11147

**AIRCRAFT PARTS**
In-service landing gear actuation system problems - The solution
[AIAA PAPER 85-4019] p 23 A86-10954
WIT - Test system for the MD-80s --- Wire Integrity Test for avionics of commercial aircraft
[AIAA PAPER 85-5082] p 34 A86-11428
Temperature dependence of inclusion-fracture-related acoustic emissions in 7075-T651 aluminum p 52 A86-12584
Full-scale testing of the VNII NP-261 lubricant p 53 A86-12607

**AIRCRAFT PERFORMANCE**
Integrated Flight Data Processing System - Support for the discipline engineer
[AIAA PAPER 85-4042] p 25 A86-10970
High angle of attack maneuvering probed p 29 A86-11959
B-1B - Born again bomber p 30 A86-12009
Laboratory model of flight through wind shear p 67 N86-11747

**AIRCRAFT PRODUCTION**
Some fabrication experiments towards a composite RPV wing p 51 A86-10364
Characteristics of the design and fabrication of large aircraft components in composite materials p 30 A86-12545

**AIRCRAFT PRODUCTION COSTS**
General aviation cost effectiveness
[AIAA PAPER 85-4029] p 73 A86-10959

**AIRCRAFT RELIABILITY**
Specification and review of flight critical digital systems
[AIAA PAPER 85-5097] p 46 A86-11437
Reliability of wide-body aircraft p 59 A86-12600
A review of Australian investigations on aeronautical fatigue during the period April 1983 to March 1985
[AD-A156602] p 31 N86-10036
Flight worthiness of fire resistant hydraulic systems: Volume 1
[AD-A157618] p 33 N86-11199

**AIRCRAFT SAFETY**
Design of static reaction gantry for an ultralight airplane destruction test
[AIAA PAPER 85-4022] p 49 A86-10955
Proposed modifications for the RAAF Airtrainer CT-4A cockpit
[AD-A156808] p 31 N86-10039
Rotary-wing operations in a microburst environment
[AD-A156695] p 65 N86-10713
User's manual for AC-20-53A protection of airplane fuel systems against fuel vapor ignition due to lightning
[AD-A157619] p 20 N86-11191
Meteorological and Environmental Inputs to Aviation Systems
[NASA-CP-2388] p 66 N86-11735
Overview of FAA's aircraft icing program p 66 N86-11740
Advance particle and Doppler measurement methods p 67 N86-11745

**AIRCRAFT SPECIFICATIONS**
Development of design data for propulsion PMR-15 composites p 54 N86-11285

**AIRCRAFT STABILITY**
Digital flight control of longitudinally unstable aircraft
[AIAA PAPER 85-3088] p 46 A86-10942
Ground resonance analysis using a substructure modeling approach p 25 A86-11152
Parametric study of the aeroelastic stability of a bearingless rotor p 25 A86-11153
Nonlinear dynamics of a helicopter model in ground resonance p 25 A86-11154
Development and application of a time-history analysis for rotorcraft dynamics based on a component approach p 26 A86-11161
Influence of various unsteady aerodynamic models on the aeromechanical stability of a helicopter in ground resonance p 27 A86-11164
Flap-lag-torsion stability in forward flight p 27 A86-11166
Structural identification of linear time-invariant dynamic systems under random inputs p 70 A86-11597
A method for the modal synthesis of an aircraft lateral motion control law p 47 A86-12557

**AIRCRAFT STRUCTURES**
Viscous drag reduction with microporous-faced honeycomb sandwich for modern turbofan installations p 29 A86-11607
The influence of thickness in predictions of lifetime and crack propagation in cases involving dynamically loaded aeronautical metal sheets p 57 A86-11774
Optimization of airplane wing structures under gust loads p 29 A86-11883
Aircraft structure surveillance in-flight using acoustic emission p 35 A86-12572
In-flight AE monitoring p 59 A86-12573
Acoustic emission monitoring of aircraft structures p 59 A86-12575
Review of investigations on aeronautical fatigue in the Federal Republic of Germany
[LBF-S-173] p 32 N86-10044
Fatigue, static tensile strength and stress corrosion of aircraft materials and structures
[VTH-LR-360-PT-1] p 32 N86-10045
Nondestructive control of thick structures made without disassembling
[PV-43-954/F/3] p 60 N86-10564
Nondestructive corrosion test of aluminum alloy structures
[PV-43-954/F/2] p 60 N86-10594

**AIRCRAFT SURVIVABILITY**
An overview of EMP effects and their control p 56 A86-12074

**AIRCRAFT TIRES**
A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear
[NASA-TP-2481] p 64 N86-11522

**AIRFOIL PROFILES**
An experimental investigation into the effects of modifying the trailing edge geometry of a Wortmann FX63-137 aerofoil p 4 A86-10363
Impact of airfoil profile on the supersonic aerodynamics of delta wings
[AIAA PAPER 85-4073] p 7 A86-11038
Comparison between experimental and computational results for airfoils equipped with a spoiler and a flap
[AIAA PAPER 85-5008] p 10 A86-11063
The separated and non-separated airfoil wake behavior in the presence of free stream turbulence
[AIAA PAPER 85-5027] p 11 A86-11073
Airfoil dynamic stall performance with large-amplitude motions p 12 A86-11226
Dynamic stall modeling of the NACA 0012 profile p 14 A86-12024
Analysis of hyperlift systems. Study of a singularities method
[SNIAS-443.529/84] p 19 N86-10024
Aerodynamic method used in France for advanced fast propeller study p 42 N86-11149
Modern propeller profiles p 42 N86-11152

**AIRFOILS**
Comparison of uniform perturbation and numerical solutions for some potential flows past slender bodies p 4 A86-10268
Numerical simulation of transonic flow over porous airfoils
[AIAA PAPER 85-5022] p 11 A86-11070
Comparison of transonic airfoil characteristics by Navier-Stokes computation and by wind tunnel test at high Reynolds number
[AIAA PAPER 85-5025] p 11 A86-11071
The use of numerical optimization for airfoil design
[AIAA PAPER 85-5026] p 11 A86-11072
A new method for calculating unsteady supersonic aerodynamic forces and its application p 16 N86-10009
On the design of airfoils in transonic flow using the Euler equations p 17 N86-10013
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231] p 31 N86-10033
Some considerations in propeller and airframe integration p 44 N86-11164
User's manual for a 0.3-m TCT wall interference assessment/correction procedure: 8- by 24-inch airfoil test section
[NASA-TM-87582] p 20 N86-11189
Gas side heat transfer p 62 N86-11507
Coolant passage heat transfer with rotation. A progress report on the computational aspects p 63 N86-11510

**AIRFRAMES**
An examination of the relations between rotor vibratory loads and airframe vibrations p 28 A86-11169
Boeing stress analysis workstation development
[AIAA PAPER 85-6014] p 69 A86-11445
Attachment method-ceramic radome to metal body
[AD-D011778] p 30 N86-10032
A review of Australian investigations on aeronautical fatigue during the period April 1983 to March 1985
[AD-A156602] p 31 N86-10036
On the aerodynamics of installed propellers p 42 N86-11154
Full-scale flight and model-scale wind tunnel tests on the nearfield noise characteristics of aircraft propellers p 71 N86-11172

**AIRPORTS**
Enhancing aircraft rough airfield capabilities
[AIAA PAPER 85-4018] p 23 A86-10953
Helicopter montage of a path antenna setup for the instrumental landing system SF 70 at Dresden airport p 49 A86-11775
Enhanced airport surface detection equipment applications
[AD-A157641] p 50 N86-11210
Validation of procedures for pavement design on expansive soils
[FAA-PM-85-15] p 61 N86-11362

**AIRSHIPS**
A technical-economical analysis of airships of various sizes, shapes, and gas permeability of the shell p 30 A86-12530
The dirigible: A catalyst for resource exploitation in remote areas? [AD-A156518] p 31 N86-10034
**AIRSPACE**
Enhanced airport surface detection equipment applications [AD-A157641] p 50 N86-11210
**ALGEBRA**
Algebraic polynomial approximation in the LSQ sense of a family of curves [AIAA PAPER 85-6026] p 69 A86-11455
**ALGORITHMS**
A technique for the inverse aerodynamic design of nacelles and wing configurations [AIAA PAPER 85-4096] p 9 A86-11054
Generation of flight paths using hierarchical planning [AD-A156905] p 70 N86-10900
**ALIGNMENT**
CRC control systems laboratory gyro test facility [CRC-1385] p 49 N86-11205
**ALLOYS**
Life prediction and constitutive behavior p 64 N86-11520
**ALTIMETERS**
Precise vertical speed reconstruction based on vertical acceleration and barometric altitude p 34 A86-11762
**ALUMINUM**
Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247
Adhesives for aerospace p 53 N86-11249
**ALUMINUM ALLOYS**
Temperature dependence of inclusion-fracture-related acoustic emissions in 7075-T651 aluminum p 52 A86-12584
Nondestructive corrosion test of aluminum alloy structures [PV-43-954/F/2] p 60 N86-10594
**AMPLITUDES**
Forced response analysis of an aerodynamically detuned supersonic turbomachine rotor [NASA-TM-87093] p 18 N86-10019
**ANGLE OF ATTACK**
Symmetric separated flow past slender bodies at angles of attack in subsonic and supersonic flows [AIAA PAPER 85-5007] p 10 A86-11062
High angle of attack maneuvering probed p 29 A86-11959
Preliminary design study of a lateral-directional control system using thrust vectoring [NASA-TM-86425] p 48 N86-11203
**ANGLES (GEOMETRY)**
Laser angle sensor [NASA-CR-172369] p 49 N86-11207
**ANNULAR FLOW**
Experimental results from a reverse flow annual combustor p 57 A86-11696
**ANTENNA ARRAYS**
Helicopter montage of a path antenna setup for the instrumental landing system SP 70 at Dresden airport p 49 A86-11775
**ANTISUBMARINE WARFARE AIRCRAFT**
A comparative analysis of a CV helicopter and a JVX (Joint Services Advanced Vertical Lift) tilt-rotor aircraft in an aircraft carrier based ASW (Anti-Submarine Warfare) [AD-A156871] p 31 N86-10041
**APPROACH CONTROL**
Approach and landing thrust reverser testing in ground effect [AIAA PAPER 85-3075] p 23 A86-10935
**APPROXIMATION**
Algebraic polynomial approximation in the LSQ sense of a family of curves [AIAA PAPER 85-6026] p 69 A86-11455
Second order approximation method for transonic flows over swept wings p 16 N86-10002
**ARCHITECTURE (COMPUTERS)**
Transparent contention buses can improve architectures --- for avionics [AIAA PAPER 85-5051] p 34 A86-11410
Multiprocessor application in flight management systems [AIAA PAPER 85-5079] p 34 A86-11425
Architectural concepts for integrated realtime multiprocessors [AIAA PAPER 85-5053] p 69 A86-11464
**ARMED FORCES (UNITED STATES)**
F-16X MSIP (Multi-national Staged Improvement Program) case example: Operating and support cost estimation using VAMOSC (Visibility And Management Of Operating and Support Costs) [AD-A156893] p 3 N86-10006
Let's get serious about software [AD-A156819] p 70 N86-10831
A computer engineering curriculum for the Air Force Academy: An implementation plan [AD-A156464] p 70 N86-11857
**ARTIFICIAL INTELLIGENCE**
Considerations for the implementation of intelligent workstation networks [AIAA PAPER 85-4001] p 68 A86-10948
Vision-based road following for an autonomous land vehicle [AIAA PAPER 85-6047] p 57 A86-11461
Generation of flight paths using hierarchical planning [AD-A156905] p 70 N86-10900
**ASCENT PROPULSION SYSTEMS**
Heavy lift launch vehicles for 1995 and beyond [NASA-TM-86520] p 51 N86-11216
**ASPECT RATIO**
Influence of tip blowing on rectangular wings [AIAA PAPER 85-5001] p 9 A86-11056
An asymptotic theory for the interference of large aspect ratio swept wings and multiple propeller slipstreams p 44 N86-11167
Application of the vortex-lattice concept to flows with smooth-surface separation [AD-A157571] p 61 N86-11430
**ASYMPTOTIC METHODS**
An asymptotic theory for the interference of large aspect ratio swept wings and multiple propeller slipstreams p 44 N86-11167
**ATMOSPHERIC DIFFUSION**
Initial dispersion of jet engine exhaust plume p 39 A86-11666
**ATMOSPHERIC EFFECTS**
Hostile atmospheric environment effects on jet engines p 39 A86-11665
**ATMOSPHERIC ELECTRICITY**
User's manual for AC-20-53A protection of airplane fuel systems against fuel vapor ignition due to lightning [AD-A157619] p 20 N86-11191
**ATTACK AIRCRAFT**
LHX program overview [AIAA PAPER 85-4006] p 2 A86-10950
**ATTITUDE (INCLINATION)**
A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear [NASA-TP-2481] p 64 N86-11522
**ATTITUDE CONTROL**
CRC control systems laboratory gyro test facility [CRC-1385] p 49 N86-11205
**ATTITUDE GYROS**
The development of a vertical gyroscope for remotely piloted vehicle (RPV) applications p 55 A86-10372
**AUTOGYROS**
The autogyro as a R.P.V p 22 A86-10358
**AUTOMATIC CONTROL**
Fundamental aspects of the theory of continuous Markovian controllable systems and the application of this theory --- Russian book p 70 A86-11535
Adhesives for aerospace p 53 N86-11249
**AUTOMATIC FLIGHT CONTROL**
ADAM - An aeroservoelastic analysis method for analog or digital systems [AIAA PAPER 85-3090] p 46 A86-10943
Mission-adaptive wing camber control systems for transport aircraft [AIAA PAPER 85-5006] p 46 A86-11061
Fundamental aspects of the theory of continuous Markovian controllable systems and the application of this theory --- Russian book p 70 A86-11535
Quasi-optimal on-line guidance laws for military aircraft [AIAA PAPER 85-1977] p 47 A86-12294
**AUTOMATIC LANDING CONTROL**
Structural identification of linear time-invariant dynamic systems under random inputs p 70 A86-11597
**AUTOMATIC PILOTS**
The problem of determining the optimum parameters of an autopilot p 47 A86-12539
**AUTONOMOUS NAVIGATION**
Vision-based road following for an autonomous land vehicle [AIAA PAPER 85-6047] p 57 A86-11461
**AVIONICS**
Transparent contention buses can improve architectures --- for avionics [AIAA PAPER 85-5051] p 34 A86-11410
Operational and support considerations in standardization --- military avionics [AIAA PAPER 85-5063] p 56 A86-11416
Is there a risc in the avionic computer future? --- Reduced Instruction Set Computers [AIAA PAPER 85-5081] p 34 A86-11427
WIT - Test system for the MD-80s --- Wire Integrity Test for avionics of commercial aircraft [AIAA PAPER 85-5082] p 34 A86-11428
Fault effect protection and partitioning for fly-by-wire/fly-by-light avionics systems [AIAA PAPER 85-6002] p 47 A86-11439
Multitask scheduling for time-critical applications [AIAA PAPER 85-6008] p 68 A86-11441
Performance analysis of a fault inferring nonlinear detection system algorithm with integrated avionics flight data [AIAA PAPER 85-6022] p 69 A86-11452
New directions in aerospace packaging --- of electronics [AIAA PAPER 85-6033] p 56 A86-11457
Radiation hardened CMOS technology for flight systems [AIAA PAPER 85-6040] p 56 A86-11460
Expert systems development and application [NASA-TM-86746] p 32 N86-11194
Description of an experimental expert system flight status monitor [NASA-TM-86791] p 32 N86-11195
Heavy lift launch vehicles for 1995 and beyond [NASA-TM-86520] p 51 N86-11216
**AXIAL FLOW TURBINES**
The performance characteristic of an air-separator of an axial flow fan p 15 A86-12267
**AXISYMMETRIC BODIES**
Mode interaction Hopf bifurcation in axisymmetric shells p 56 A86-11343
**AXISYMMETRIC FLOW**
Effect of a shear layer on the stability of an axisymmetrical external compression air intake p 16 N86-10010
Aerodynamics of wide-chord propellers in non-axisymmetric flow p 42 N86-11153
**AZIMUTH**
CRC control systems laboratory gyro test facility [CRC-1385] p 49 N86-11205

## B

**B-1 AIRCRAFT**
B-1B - Born again bomber p 30 A86-12009
**B-52 AIRCRAFT**
Stress analyses of B-52 pylon hooks [NASA-TM-84924] p 64 N86-11524
**BEAMS (SUPPORTS)**
Application of the local strain method to fatigue life estimation of a wing main beam specimen p 55 A86-10620
**BEARINGLESS ROTORS**
Is the 680 rotor Bell's LHX candidate? p 22 A86-10566
Parametric study of the aeroelastic stability of a bearingless rotor p 25 A86-11153
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover p 26 A86-11156
Dynamic stability of a bearingless circulation control rotor blade in hover p 27 A86-11167
**BELL AIRCRAFT**
Is the 680 rotor Bell's LHX candidate? p 22 A86-10566
**BELLMAN THEORY**
Stochastic dynamic system suboptimal control with uncertain parameters p 67 A86-10191
**BLADE SLAP NOISE**
A numerical method of calculating propeller noise including acoustic nonlinear effects p 72 N86-12011
**BLADE TIPS**
Aeroelastic considerations for torsionally soft rotors p 26 A86-11159
**BLADES**
A numerical method of calculating propeller noise including acoustic nonlinear effects p 72 N86-12011
**BLASIUS EQUATION**
Extension of the Blasius force theorem to subsonic speeds p 56 A86-11250
**BLOWING**
Influence of tip blowing on rectangular wings [AIAA PAPER 85-5001] p 9 A86-11056
**BLUFF BODIES**
On the relationship between flame stability and drag of bluff-body flameholders p 51 A86-11645
**BODIES OF REVOLUTION**
Theory of local interaction in a rarefied gas - Variant of the method of tangent cones p 5 A86-10658
**BODY-WING CONFIGURATIONS**
Unsteady full potential calculations for complex wing-body configurations [AIAA PAPER 85-4062] p 7 A86-11032
**BOEING AIRCRAFT**
Large airplane derivative development methodology [AIAA PAPER 85-3043] p 22 A86-10926
**BONDING**
Adhesives for aerospace p 53 N86-11249

Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270
Chemical bonding agent for suppression of rusty bolt intermodulation interference [AD-D011747] p 54 N86-11315

**BOOSTER ROCKET ENGINES**
Heavy lift launch vehicles for 1995 and beyond [NASA-TM-86520] p 51 N86-11216

**BOUNDARY LAYER CONTROL**
Numerical simulation of transonic flow over porous airfoils [AIAA PAPER 85-5022] p 11 A86-11070
The shock patterns in the two-dimensional inlet with a bleed p 13 A86-11611
JetStar smoothes the way p 30 A86-12008

**BOUNDARY LAYER FLOW**
Computational fluid dynamics - Its present status and future direction p 55 A86-10267
Bounded flow past a supercavitating finite-span wing p 5 A86-10729
Turbulence characteristics of a plane diffuser flow with inlet velocity distortion p 59 A86-12608
Acta Aeronautica et Astronautica Sinica (selected articles) [AD-A147304] p 3 N86-10001
Second order approximation method for transonic flows over swept wings p 16 N86-10002
Investigations on a supercritical airfoil with boundary layer suction through a perforated strip in the shock region [DFVLR-FB-85-15] p 19 N86-10025

**BOUNDARY LAYER SEPARATION**
A mathematically simple turbulence closure model for attached and separated turbulent boundary layers p 55 A86-11232
Turbulent boundary layer separation on engine components p 14 A86-11675
Critical examination of turbulence models for a separated three dimensional turbulent boundary layer p 14 A86-12020
The role of freestream turbulence scale in subsonic flow separation [NASA-CR-176237] p 17 N86-10014
Three-dimensional inviscid analysis of radial turbine flow and a limited comparison with experimental data [NASA-TM-87091] p 17 N86-10017
Application of the vortex-lattice concept to flows with smooth-surface separation [AD-A157571] p 61 N86-11430

**BOUNDARY LAYER TRANSITION**
The laminar-turbulent transition zone in the boundary layer p 55 A86-10822
Comparison of predicted and measured drag for a single-engine airplane [AIAA PAPER 85-4038] p 24 A86-10967

**BOW WAVES**
Shock fitting in conical supersonic full potential flows p 4 A86-10270
Entropy corrections to supersonic conical nonlinear potential flows p 4 A86-10271

**BRANCHING (MATHEMATICS)**
Mode interaction Hopf bifurcation in axisymmetric shells p 56 A86-11343

**BURNERS**
Burner liner thermal/structural load modelling p 63 N86-11514
Component-specific modeling p 45 N86-11515

**BYPASS RATIO**
Determination of the thrust of a bypass engine under operating conditions p 41 A86-12546

**C**

**C-5 AIRCRAFT**
In-service landing gear actuation system problems - The solution [AIAA PAPER 85-4019] p 23 A86-10954

**CALIBRATING**
Operating characteristics of the multiple critical Venturi System and secondary calibration nozzles used for weight-flow measurements in the Langley 16-foot transonic tunnel [NASA-TM-86405] p 17 N86-10016

**CAMBERED WINGS**
Aerodynamic design considerations for efficient high-lift supersonic wings [AIAA PAPER 85-4076] p 8 A86-11041

**CANADA**
Condor - A Canadian RPA for commercial applications p 22 A86-10374

**CARBON FIBER REINFORCED PLASTICS**
Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270

**CARGO AIRCRAFT**
World's largest airplane now being tested p 32 N86-11181

**CASCADE FLOW**
Correction of lift coefficient for tandem circular-cascade diffusers p 55 A86-10476
The effect of acoustically lined walls on cascade flutter p 36 A86-10477
Structure and decay of secondary flow in the downstream of a cascade p 15 A86-12265

**CAST ALLOYS**
State-of-art and prospects of casting turbine blades p 52 A86-12311

**CENTRIFUGAL COMPRESSORS**
Prediction of outlet flow characteristics of centrifugal impellers. I - Consideration of velocity distortion p 55 A86-10481
Recent progress on compressor stability in France p 14 A86-11602
A study of aerodynamic performance of diffusers for centrifugal compressors p 15 A86-12266

**CENTRIFUGAL PUMPS**
A study of the swirling of a liquid by porous rotors --- in aircraft engine centrifugal pumps p 40 A86-12532

**CERAMICS**
Attachment method-ceramic radome to metal body [AD-D011778] p 30 N86-10032

**CHAFF**
AIRBOC (air rapid bloom offboard chaff) chaff deployment system [AD-D011746] p 60 N86-10554

**CHANNELS (DATA TRANSMISSION)**
Transparent contention buses can improve architectures --- for avionics [AIAA PAPER 85-5051] p 34 A86-11410

**CHEMICAL PROPERTIES**
Chemical bonding agent for suppression of rusty bolt intermodulation interference [AD-D011747] p 54 N86-11315

**CHLORINE FLUORIDES**
Flight worthiness of fire resistant hydraulic systems: Volume 1 [AD-A157618] p 33 N86-11199

**CHOKES (FUEL SYSTEMS)**
Operating characteristics of the multiple critical Venturi System and secondary calibration nozzles used for weight-flow measurements in the Langley 16-foot transonic tunnel [NASA-TM-86405] p 17 N86-10016

**CIRCULAR CYLINDERS**
Aerodynamic interaction between vortical wakes and the viscous flow about a circular cylinder [AIAA PAPER 85-4063] p 12 A86-11096

**CIRCULATION CONTROL AIRFOILS**
Noise from a circulation control wing with upper surface blowing [AIAA PAPER 85-3083] p 5 A86-10939

**CIRCULATION CONTROL ROTORS**
Dynamic stability of a bearingless circulation control rotor blade in hover p 27 A86-11167
Dynamic response characteristics of a circulation control rotor model pneumatic system p 28 A86-11168

**CIRCULATION DISTRIBUTION**
Maximum circulation lift coefficient developed on a low aspect ratio wing with a blown flap [AIAA PAPER 85-3085] p 6 A86-10940

**CIVIL AVIATION**
Experimental RPV - An Indian experience p 21 A86-10355
A review of Australian investigations on aeronautical fatigue during the period April 1983 to March 1985 [AD-A156802] p 31 N86-10036
Deputy minister on sector's technical progress p 4 N86-11178

**CLEANING**
The factory of the future p 60 N86-11228

**CLEAR AIR TURBULENCE**
Development of a wind shear performance envelope p 67 N86-11746

**CLOSURE LAW**
A mathematically simple turbulence closure model for attached and separated turbulent boundary layers p 55 A86-11232

**CLOUD COVER**
A study into the operability of RPVs in adverse weather p 20 A86-10352

**CLOUD GLACIATION**
Comparative flight measurement of icing parameters for the propeller aircraft Do-28D2 of the test station 61 of the DFVLR and for the DFVLR aircraft Falon 20e in stratus clouds [DFVLR-FB-85-16] p 65 N86-10720

**CLOUD PHYSICS**
A new characterization of supercooled clouds below 10,000 feet AGL p 66 N86-11744

**CLOUDS**
A new characterization of the icing environment below 10,000 feet AGL from 7,000 miles of measurements in supercooled clouds p 66 N86-11743

**CMOS**
Radiation hardened CMOS technology for flight systems [AIAA PAPER 85-6040] p 56 A86-11460

**COASTAL WATER**
Adverse weather impact on aviation safety, investigation and oversight p 66 N86-11742

**COCKPITS**
Proposed modifications for the RAAF Airtrainer CT-4A cockpit [AD-A156808] p 31 N86-10039
Visual and motion cueing in helicopter simulation [NASA-TM-86818] p 50 N86-11208

**COLLISION AVOIDANCE**
Traffic Alert and Collision Avoidance System Signal Environment Model (TCAS SEM) programmer's reference manual [FAA-PM-85-22] p 21 N86-11182

**COMBAT**
The quest for a helicopter suitable for combat rescue, 1967 - 1983 [AD-A156842] p 31 N86-10040

**COMBUSTIBLE FLOW**
Numerical modeling of afterburner combustion p 38 A86-11641

**COMBUSTION**
Problems of ignition correlations - An assessment of applications to real combustors p 52 A86-11694
Turbine Engine Hot Section Technology (HOST) [NASA-CP-2289] p 61 N86-11485
Combustion hot section technology p 45 N86-11512

**COMBUSTION CHAMBERS**
Combustion engineering and research for gas turbines p 37 A86-11608
Combustion research for gas turbine engines p 37 A86-11609
Development of new combustor technologies at SNECMA p 37 A86-11610
Ramjet research in France - Realities and perspectives [ONERA, TP NO. 1985-108] p 38 A86-11624
Experimental results from a reverse flow annual combustor p 57 A86-11696
Transportation and impingement/effusion cooling of gas turbine combustion chambers p 40 A86-11697
Combustion and emissions performance of a rapid fuel and air mixing combustor p 52 A86-11698
Concentration distributions in cylindrical combustors p 58 A86-11937
Turbine engine Hot Section Technology (HOST) project p 61 N86-11496
Hot section viewing system p 61 N86-11498
Dynamic gas temperature measurement system p 62 N86-11499
Demonstration test of burner liner strain measurement systems: Interim results p 62 N86-11501
Combustion hot section technology p 45 N86-11512
The 3D inelastic analysis methods for hot section components p 63 N86-11516
The 3-D inelastic analysis methods for hot section components (base program) p 63 N86-11517
HOST liner cyclic facilities p 63 N86-11519

**COMBUSTION EFFICIENCY**
Combustion and emissions performance of a rapid fuel and air mixing combustor p 52 A86-11698

**COMBUSTION VIBRATION**
A method for designing a surge protection device for gas turbine engines p 40 A86-12541
Unsteady operation of the fuel nozzles of the main combustion chamber of a gas-turbine engine p 41 A86-12549

**COMMAND AND CONTROL**
Data link communications in tactical air command and control systems p 21 A86-11116

**COMMERCIAL AIRCRAFT**
Agonies of the Lear Fan p 1 A86-10148
The Brazilian aircraft industry and the use of law as a tool for development p 72 A86-10274
Condor - A Canadian RPA for commercial applications p 22 A86-10374
Large airplane derivative development methodology [AIAA PAPER 85-3043] p 22 A86-10926
Configuration studies for fuel-efficiency maximisation [AIAA PAPER 85-4032] p 24 A86-10961
Aero gas turbine engines for commercial application p 37 A86-11604
Reliability of wide-body aircraft p 59 A86-12600

**COMMONALITY**
Post-2000 - The multimode aircraft system [AIAA PAPER 85-4015] p 2 A86-10952

**COMMUNICATION**
Corporate/commuter airlines meteorological requirements p 66 N86-11739
**COMPARISON**
Comparison of uniform perturbation and numerical solutions for some potential flows past slender bodies p 4 A86-10268
**COMPLEX SYSTEMS**
Multitask scheduling for time-critical applications [AIAA PAPER 85-6008] p 68 A86-11441
**COMPONENT RELIABILITY**
AE monitoring of jet engine breech chambers p 59 A86-12561
Assuring the reliability of aircraft engines p 41 A86-12599
**COMPOSITE MATERIALS**
A rapid evaluation approach for configuration development of new aircraft [AIAA PAPER 85-3068] p 22 A86-10932
An adhesively sealed, composite skinned wing fuel tank [AIAA PAPER 85-4023] p 23 A86-10956
Approaches to development of composite materials for aviation industry in China p 52 A86-12313
**COMPOSITE STRUCTURES**
New world for aerospace composites p 51 A86-10145
Filament winding - Waking the sleeping giant p 54 A86-10146
Some fabrication experiments towards a composite RPV wing p 51 A86-10364
Characteristics of the design and fabrication of large aircraft components in composite materials p 30 A86-12545
A review of Australian investigations on aeronautical fatigue during the period April 1983 to March 1985 [AD-A158602] p 31 N86-10036
Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247
**COMPRESSIBLE BOUNDARY LAYER**
A numerical solution of the shock-turbulent interaction over a compression corner for supersonic flow p 16 N86-10003
**COMPRESSIBLE FLOW**
Numerical experiment with inviscid vortex-stretched flow around a cranked delta wing - Subsonic speed [AIAA PAPER 85-4080] p 8 A86-11043
Three-dimensional flow effects in a two-dimensional air intake with mixed supersonic compression p 13 A86-11612
**COMPRESSOR BLADES**
Determination of high cycle fatigue life of axial compressor blades of turbojet engines fitted in military aircraft p 37 A86-11618
**COMPRESSOR EFFICIENCY**
Recent progress on compressor stability in France p 14 A86-11692
**COMPRESSOR ROTORS**
An experimental study of the compressor rotor flow field at off-design condition using laser Doppler velocimeter p 13 A86-11636
**COMPRESSORS**
Modern technology application to compressor and turbine aerodynamics p 13 A86-11635
**COMPUTATIONAL FLUID DYNAMICS**
Computational fluid dynamics - Its present status and future direction p 55 A86-10267
Solution of viscous transonic flow over wings p 4 A86-10269
Bounded flow past a supercavitating finite-span wing p 5 A86-10729
Nonsymmetric solutions in the problem of flow past a plate with a pair of vortex-sink combinations p 5 A86-10735
Integrated flowfield analysis methodology for fighter inlets [AIAA PAPER 85-3071] p 5 A86-10933
Comparison of predicted and measured drag for a single-engine airplane [AIAA PAPER 85-4038] p 24 A86-10967
Analysis of leading-edge vortices on complex configurations [AIAA PAPER 85-4054] p 6 A86-11026
A unique applied computational method for vortex lift aerodynamics and vortex burst for arbitrary aircraft [AIAA PAPER 85-4057] p 6 A86-11028
An efficient method for computing unsteady transonic aerodynamics of swept wings with control surfaces [AIAA PAPER 85-4058] p 6 A86-11029
Unsteady full potential calculations for complex wing-body configurations [AIAA PAPER 85-4062] p 7 A86-11032
Aerodynamic bugs - Can CFD spray them away? --- Computational Fluid Dynamics for transport aircraft design [AIAA PAPER 85-4067] p 7 A86-11033
Computational wing design in support of an NLF variable sweep transition flight experiment --- Natural Laminar Flow [AIAA PAPER 85-4074] p 7 A86-11039
Experimental verification of three-dimensional transonic inverse method [AIAA PAPER 85-4077] p 8 A86-11042
Flow-field computations around nozzle/afterbody configurations at transonic Mach numbers [AIAA PAPER 85-4081] p 8 A86-11044
Optimization of three-dimensional computational grids [AIAA PAPER 85-4087] p 8 A86-11048
Comparison of results from a panel method and an Euler code for a cranked delta wing [AIAA PAPER 85-4091] p 9 A86-11051
PAN AIR consultations using expert system techniques --- computational fluid dynamics tool for aircraft design [AIAA PAPER 85-4094] p 68 A86-11053
A technique for the inverse aerodynamic design of nacelles and wing configurations [AIAA PAPER 85-4096] p 9 A86-11054
Flow simulations for detailed nacelle-exhaust flow using Euler equations [AIAA PAPER 85-5003] p 10 A86-11058
Transonic separated solutions for an augmentor-wing [AIAA PAPER 85-5004] p 10 A86-11059
Computational estimations of strut support interference at transonic Mach numbers [AIAA PAPER 85-5018] p 11 A86-11066
Estimating water vapor condensation effects for transonic and supersonic flow fields [AIAA PAPER 85-5020] p 11 A86-11068
Comparison of transonic airfoil characteristics by Navier-Stokes computation and by wind tunnel test at high Reynolds number [AIAA PAPER 85-5025] p 11 A86-11071
The use of numerical optimization for airfoil design [AIAA PAPER 85-5026] p 11 A86-11072
Aerodynamic interaction between vortical wakes and the viscous flow about a circular cylinder [AIAA PAPER 85-4063] p 12 A86-11096
Three-dimensional calculation of transonic viscous flows by an implicit method p 12 A86-11230
A mathematically simple turbulence closure model for attached and separated turbulent boundary layers p 55 A86-11232
The role of computational technic in the development of high performance airbreathing engines p 37 A86-11603

Combustion research for gas turbine engines p 37 A86-11609
Calculation of external and internal transonic flow field of a three-dimensional S-shaped inlet p 13 A86-11616
Numerical modeling of afterburner combustion p 38 A86-11641
Turbulent boundary layer separation on engine components p 14 A86-11675
Critical examination of turbulence models for a separated three dimensional turbulent boundary layer p 14 A86-12020
A vortex point method for calculating inviscid incompressible flows around rotary wings p 14 A86-12021
Numerical solution of hypersonic flow near leading edge of a flat plate p 16 N86-10008
Aerodynamics and Acoustics of Propellers [AGARD-CP-366] p 3 N86-11147
Aerodynamic method used in France for advanced fast propeller study p 42 N86-11149
Design concept and performance prediction technique for potential flows around advanced propellers p 42 N86-11150
A review of ARA research into propeller aerodynamic prediction methods p 42 N86-11151
Aerodynamics of wide-chord propellers in non-axisymmetric flow p 42 N86-11153
A unified approach for the aerodynamics and acoustics of propellers in forward motion p 42 N86-11155
Theoretical analysis of linearized acoustics and aerodynamics of advanced supersonic propellers p 43 N86-11156
A general theory of arbitrary motion aerodynamics using an aeroacoustic approach p 43 N86-11157
Coolant passage heat transfer with rotation. A progress report on the computational aspects p 63 N86-11510
**COMPUTATIONAL GRIDS**
Optimization of three-dimensional computational grids [AIAA PAPER 85-4087] p 8 A86-11048
Computational grid generation for realistic aircraft configurations [AIAA PAPER 85-4089] p 9 A86-11049
An investigation of gridding on the accuracy of FLO57MM and FLO57MG Euler wing solutions [AIAA PAPER 85-4090] p 9 A86-11050
Three-dimensional solutions to the Euler equations with one million grid points p 15 A86-12062
Inviscid flow field analysis of maneuvering hypersonic vehicles using the SCM formulation and parabolic grid generation [DE85-013950] p 18 N86-10021
**COMPUTER AIDED DESIGN**
Large airplane derivative development methodology [AIAA PAPER 85-3043] p 22 A86-10926
A rapid evaluation approach for configuration development of new aircraft [AIAA PAPER 85-3068] p 22 A86-10932
Teaching and learning conceptual design in the CAD era Generating problems and integrating solutions [AIAA PAPER 85-3081] p 73 A86-10937
Integrated systems for component specific design and analysis [AIAA PAPER 85-3097] p 68 A86-10946
Considerations for the implementation of intelligent workstation networks [AIAA PAPER 85-4001] p 68 A86-10948
A computer-assisted process for supersonic aircraft conceptual design [AIAA PAPER 85-4027] p 23 A86-10958
Aerodynamic bugs - Can CFD spray them away? --- Computational Fluid Dynamics for transport aircraft design [AIAA PAPER 85-4067] p 7 A86-11033
Computational grid generation for realistic aircraft configurations [AIAA PAPER 85-4089] p 9 A86-11049
Restructuring the rotor analysis program C-60 p 27 A86-11162
Structural optimization by multilevel decomposition p 56 A86-11245
Boeing stress analysis workstation development [AIAA PAPER 85-6014] p 69 A86-11446
The role of computational technic in the development of high performance airbreathing engines p 37 A86-11603
Optimisation of recess-action conformal profiles for aero gas-turbine engine gears - A computer based analytical approach p 57 A86-11617
Experimental results from a reverse flow annual combustor p 57 A86-11696
Optimization of airplane wing structures under gust loads p 29 A86-11883
Representation of a turbine profile in the form of a Bezier curve p 15 A86-12551
**COMPUTER GRAPHICS**
Considerations for the implementation of intelligent workstation networks [AIAA PAPER 85-4001] p 68 A86-10948
**COMPUTER NETWORKS**
Considerations for the implementation of intelligent workstation networks [AIAA PAPER 85-4001] p 68 A86-10948
Data link communications in tactical air command and control systems p 21 A86-11116
**COMPUTER PROGRAMMING**
Let's get serious about software [AD-A156819] p 70 N86-10831
Expert systems development and application [NASA-TM-86746] p 32 N86-11194
**COMPUTER PROGRAMS**
Optimum design of an aircraft wing structure with multiple constraints by the direct-vision criteria method p 30 N86-10004
On the design of airfoils in transonic flow using the Euler equations p 17 N86-10013
An investigation of in-flight near-field propeller noise generation and transmission p 71 N86-11171
KRASH85 user's guide: Input/output format [FAA-CT-85-10] p 70 N86-11898
A numerical method of calculating propeller noise including acoustic nonlinear effects p 72 N86-12011
**COMPUTER SYSTEMS DESIGN**
Matched processors for quantized control - A practical parallel-processing approach p 68 A86-11123
Computational structural mechanics: A new activity at the NASA Langley Research Center [NASA-TM-87612] p 65 N86-11540
**COMPUTER SYSTEMS PERFORMANCE**
The automated interactive simulation modeling system [AIAA PAPER 85-5055] p 68 A86-11411
**COMPUTER SYSTEMS PROGRAMS**
Traffic Alert and Collision Avoidance System Signal Environment Model (TCAS SEM) programmer's reference manual [FAA-PM-85-22] p 21 N86-11192

**COMPUTER TECHNIQUES**
Integrated Flight Data Processing System - Support for the discipline engineer
[AIAA PAPER 85-4042] p 25 A86-10970
Computational structural mechanics: A new activity at the NASA Langley Research Center
[NASA-TM-87612] p 65 N86-11540

**COMPUTER VISION**
Vision-based road following for an autonomous land vehicle
[AIAA PAPER 85-6047] p 57 A86-11461

**COMPUTERIZED SIMULATION**
The automated interactive simulation modeling system
[AIAA PAPER 85-5055] p 68 A86-11411
Numerical simulation of self-excited oscillations in a ramjet inlet-diffuser flow p 13 A86-11615

**COMPUTERS**
The factory of the future p 60 N86-11228

**CONDENSING**
Estimating water vapor condensation effects for transonic and supersonic flow fields
[AIAA PAPER 85-5020] p 11 A86-11068

**CONES**
Theory of local interaction in a rarefied gas - Variant of the method of tangent cones p 5 A86-10658

**CONFERENCES**
Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings and Supplementary Papers p 1 A86-10351
Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings p 25 A86-11151
Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers p 68 A86-11401
International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings p 36 A86-11601

**CONFORMAL MAPPING**
On the design of airfoils in transonic flow using the Euler equations p 17 N86-10013

**CONICAL FLOW**
Shock fitting in conical supersonic full potential flows p 4 A86-10270
Entropy corrections to supersonic conical nonlinear potential flows p 4 A86-10271

**CONTAMINATION**
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231] p 31 N86-10033

**CONTROL CONFIGURED VEHICLES**
Optimum wing - For all flight conditions? p 29 A86-11961

**CONTROL EQUIPMENT**
The Vega portable radar tracking control system p 20 A86-10368
Multitask scheduling for time-critical applications
[AIAA PAPER 85-6008] p 68 A86-11441
Methodology of the flight testing of the flight-control and navigation equipment of aircraft and helicopters --- Russian book p 21 A86-12046
A dynamic analysis of the dimensional chains of aircraft control systems p 47 A86-12554

**CONTROL SIMULATION**
Control concepts for in-flight simulation including actuator nonlinearities and time delays
[DFVLR-FB-85-24] p 48 N86-10047

**CONTROL STABILITY**
Mission-oriented requirements for updating MIL-H-8501: Calspan proposed structure and rationale
[NASA-CR-177371] p 48 N86-11204

**CONTROL STICKS**
Proposed modifications for the RAAF Airtrainer CT-4A cockpit
[AD-A156808] p 31 N86-10039

**CONTROL SYSTEMS DESIGN**
Finite wordlength design of digital Kalman filters for state estimation p 67 A86-10180
Digital flight control systems for UMA --- unmanned aircraft p 46 A86-10371
Integrated flight/propulsion control - Methodology, design, and evaluation
[AIAA PAPER 85-3048] p 36 A86-10927
Matched processors for quantized control - A practical parallel-processing approach p 68 A86-11123
Predicate/transition network analysis of redundant channel synchronization
[AIAA PAPER 85-6020] p 69 A86-11450
Fundamental aspects of the theory of continuous Markovian controllable systems and the application of this theory --- Russian book p 70 A86-11535
Description of an experimental expert system flight status monitor
[NASA-TM-86791] p 32 N86-11195

**CONTROL THEORY**
Fundamental aspects of the theory of continuous Markovian controllable systems and the application of this theory --- Russian book p 70 A86-11535
Flight worthiness of fire resistant hydraulic systems: Volume 1
[AD-A157618] p 33 N86-11199

**CONTROL VALVES**
Dynamic response characteristics of a circulation control rotor model pneumatic system p 26 A86-11168

**CONTROLLABILITY**
System modeling and identification of equivalent systems with and without compensating time delay for control-augmented aircraft
[ESA-TT-852] p 32 N86-10043
Preliminary design study of a lateral-directional control system using thrust vectoring
[NASA-TM-86425] p 48 N86-11203
Visual and motion cueing in helicopter simulation
[NASA-TM-86818] p 50 N86-11208

**CONVECTIVE FLOW**
Application of the vortex-lattice concept to flows with smooth-surface separation
[AD-A157571] p 61 N86-11430

**CONVERGENCE**
Comment on Determination of Aerodynamic Coefficients for a Reentry Body by Means of the Kalman Filter Method p 16 N86-10011

**COOLANTS**
Coolant passage heat transfer with rotation. A progress report on the computational aspects p 63 N86-11510

**CORRELATION**
Some aeroacoustic wind tunnel measurements, theoretical predictions, and flight-test correlations on subsonic aircraft propellers p 45 N86-11170

**CORROSION**
An assessment of the effect of corrosion wear on the stressed state and durability of plates and shells p 58 A86-12536

**CORROSION PREVENTION**
Adhesives for aerospace p 53 N86-11249

**CORROSION TESTS**
Nondestructive corrosion test of aluminum alloy structures
[PV-43-954/F/2] p 60 N86-10594

**COST ANALYSIS**
General aviation cost effectiveness
[AIAA PAPER 85-4029] p 73 A86-10959
Cost and schedule implications of multinational coproduction --- of weapon systems
[SAE PAPER 851150] p 73 A86-10972

**COST EFFECTIVENESS**
General aviation cost effectiveness
[AIAA PAPER 85-4029] p 73 A86-10959
Retrofit of SAC EC-135C and RC-135 aircraft with CFM-56 engines
[AD-A156688] p 31 N86-10038

**COST ESTIMATES**
SoftCost - A user-friendly software cost estimation tool
[AIAA PAPER 85-6009] p 69 A86-11442
F-16X MSIP (Multi-national Staged Improvement Program) case example: Operating and support cost estimation using VAMOSC (Visibility And Management Of Operating and Support Costs)
[AD-A156893] p 3 N86-10006

**COST REDUCTION**
Logistics considerations for design engineers
[AIAA PAPER 85-3056] p 67 A86-10929
Post-2000 - The multimode aircraft system
[AIAA PAPER 85-4015] p 2 A86-10952
Nondestructive corrosion test of aluminum alloy structures
[PV-43-954/F/2] p 60 N86-10594

**COWLINGS**
Application of experimental and theoretical methods to validate results obtained on an isolated inlet cowl wind tunnel test rig
[AIAA PAPER 85-5019] p 11 A86-11067

**CRACK PROPAGATION**
Application of the local strain method to fatigue life estimation of a wing main beam specimen p 55 A86-10620
The influence of thickness in predictions of lifetime and crack propagation in cases involving dynamically loaded aeronautical metal sheets p 57 A86-11774
Acoustic emission studies for detection and monitoring incipient cracks in a simulated aero engine mount under fatigue p 59 A86-12562
In-flight AE monitoring p 59 A86-12573
In-flight monitoring for incipient cracks in an aero engine mount - An approach through pattern recognition p 35 A86-12574
Temperature dependence of inclusion-fracture-related acoustic emissions in 7075-T651 aluminum p 52 A86-12584
A review of Australian investigations on aeronautical fatigue during the period April 1983 to March 1985
[AD-A156602] p 31 N86-10036
Fatigue of graphite/epoxy buffer strip panels with center cracks
[NASA-TM-87595] p 60 N86-10581
Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**CRACK TIPS**
Fatigue of graphite/epoxy buffer strip panels with center cracks
[NASA-TM-87595] p 60 N86-10581

**CRASHES**
KRASH85 user's guide: Input/output format
[FAA-CT-85-10] p 70 N86-11898

**CRASHWORTHINESS**
KRASH85 user's guide: Input/output format
[FAA-CT-85-10] p 70 N86-11898

**CREEP PROPERTIES**
Creep fatigue life prediction for engine hot section materials (isotropic) p 64 N86-11521

**CROSS FLOW**
Shock fitting in conical supersonic full potential flows p 4 A86-10270
Jet array impingement heat transfer characteristics p 63 N86-11511

**CUMULATIVE DAMAGE**
An assessment of the effect of corrosion wear on the stressed state and durability of plates and shells p 58 A86-12536

**CURING**
Evaluation of experimental epoxy monomers p 51 A86-11397
Adhesives for aerospace p 53 N86-11249

**CURVES (GEOMETRY)**
Algebraic polynomial approximation in the LSQ sense of a family of curves
[AIAA PAPER 85-6026] p 69 A86-11455

**CYCLIC LOADS**
Determination of high cycle fatigue life of axial compressor blades of turbojet engines fitted in military aircraft p 37 A86-11618

**CYLINDERS**
Characteristics of the flow around rectangular cylinders - The case of the angle of attack 0 deg p 15 A86-12271

**CYLINDRICAL BODIES**
Effect of the Reynolds number on the aerodynamic characteristics of an ogive-cylinder at high angle of attack p 14 A86-12022
Electromagnetic resonances of cylinders and aircraft model with resistive wires
[NASA-CR-176250] p 32 N86-10042
Application of the vortex-lattice concept to flows with smooth-surface separation
[AD-A157571] p 61 N86-11430

**CYLINDRICAL CHAMBERS**
Concentration distributions in cylindrical combustors p 58 A86-11937

**CYLINDRICAL SHELLS**
Mode interaction Hopf bifurcation in axisymmetric shells p 56 A86-11343

## D

**DATA ACQUISITION**
Simulated direct-strike lightning testing at Sandia National Laboratories
[DE85-012033] p 49 N86-10049

**DATA BASE MANAGEMENT SYSTEMS**
Integrated systems for component specific design and analysis
[AIAA PAPER 85-3097] p 68 A86-10946

**DATA LINKS**
Data link communications in tactical air command and control systems p 21 A86-11116

**DATA PROCESSING**
Computational structural mechanics: A new activity at the NASA Langley Research Center
[NASA-TM-87612] p 65 N86-11540

**DATA PROCESSING EQUIPMENT**
Integrated Flight Data Processing System - Support for the discipline engineer
[AIAA PAPER 85-4042] p 25 A86-10970

**DATA RECORDING**
Simulated direct-strike lightning testing at Sandia National Laboratories
[DE85-012033] p 49 N86-10049

**DATA RETRIEVAL**
Traffic Alert and Collision Avoidance System Signal Environment Model (TCAS SEM) programmer's reference manual
[FAA-PM-85-22] p 21 N86-11192

**DATA STORAGE**
Traffic Alert and Collision Avoidance System Signal Environment Model (TCAS SEM) programmer's reference manual
[FAA-PM-85-22] p 21 N86-11192
**DEFECTS**
On flaw size and distribution in lap joints
p 57 A86-11755
**DEGRADATION**
Mission-oriented requirements for updating MIL-H-8501: Calspan proposed structure and rationale
[NASA-CR-177371] p 48 N86-11204
**DELTA WINGS**
An experimental investigation of apex fence flaps on delta wings
[AIAA PAPER 85-4055] p 6 A86-11027
Impact of airfoil profile on the supersonic aerodynamics of delta wings
[AIAA PAPER 85-4073] p 7 A86-11038
Numerical experiment with inviscid vortex-stretched flow around a cranked delta wing - Subsonic speed
[AIAA PAPER 85-4080] p 8 A86-11043
Comparison of results from a panel method and an Euler code for a cranked delta wing
[AIAA PAPER 85-4091] p 9 A86-11051
The pitching delta wing p 12 A86-11227
Experimental study of vortex breakdown on a delta wing in incompressible flow
[ONERA, TP NO. 1985-107] p 15 A86-12283
**DEPLOYMENT**
AIRBOC (air rapid bloom offboard chaff) chaff deployment system
[AD-D011746] p 60 N86-10554
**DEPOSITION**
HOST liner cyclic facilities p 63 N86-11519
**DEPOSITS**
Deposits in aircraft engines. I - Type of deposits and test methods p 40 A86-11757
**DESIGN ANALYSIS**
Logistics considerations for design engineers
[AIAA PAPER 85-3056] p 67 A86-10929
A rapid evaluation approach for configuration development of new aircraft
[AIAA PAPER 85-3068] p 22 A86-10932
Teaching and learning conceptual design in the CAD era Generating problems and integrating solutions
[AIAA PAPER 85-3081] p 73 A86-10937
Study of turbine bypass remote augmentor lift system for V/STOL aircraft
[AIAA PAPER 85-3086] p 36 A86-10941
Enhancing aircraft rough airfield capabilities
[AIAA PAPER 85-4018] p 23 A86-10953
A computer-assisted process for supersonic aircraft conceptual design
[AIAA PAPER 85-4027] p 23 A86-10958
Restructuring the rotor analysis program C-60
p 27 A86-11162
Analysis of potential helicopter vibration reduction concepts p 28 A86-11172
Modern technology application to compressor and turbine aerodynamics p 13 A86-11635
Mission-oriented requirements for updating MIL-H-8501: Calspan proposed structure and rationale
[NASA-CR-177371] p 48 N86-11204
**DESTRUCTIVE TESTS**
Design of static reaction gantry for an ultralight airplane destruction test
[AIAA PAPER 85-4022] p 49 A86-10955
**DETECTION**
Understanding and improving acoustic to seismic coupling as it pertains to Sandia's helicopter detector
[DE85-009440] p 71 N86-10920
**DIFFERENTIAL EQUATIONS**
Determination of the order and structure of the linear differential equations of aircraft motion from experimental results p 47 A86-12535
**DIFFUSERS**
Correction of lift coefficient for tandem circular-cascade diffusers p 55 A86-10476
Subsonic diffuser design and performance for advanced fighter aircraft
[AIAA PAPER 85-3073] p 5 A86-10934
Development of a short radial diffuser in the high subsonic and supersonic range with special application to air breathing engines p 14 A86-11639
A study of a turbine stage with a twisted vaned diffuser p 41 A86-12548
Turbulence characteristics of a plane diffuser flow with inlet velocity distortion p 59 A86-12608
**DIFFUSION**
Application of the vortex-lattice concept to flows with smooth-surface separation
[AD-A157571] p 61 N86-11430
**DIFFUSION WELDING**
Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247
**DIGITAL FILTERS**
Finite wordlength design of digital Kalman filters for state estimation p 67 A86-10180
Precise vertical speed reconstruction based on vertical acceleration and barometric altitude p 34 A86-11762
**DIGITAL SYSTEMS**
Digital flight control systems for UMA --- unmanned aircraft p 46 A86-10371
Digital flight control of longitudinally unstable aircraft
[AIAA PAPER 85-3088] p 46 A86-10942
Specification and review of flight critical digital systems
[AIAA PAPER 85-5097] p 46 A86-11437
Fault effect protection and partitioning for fly-by-wire/fly-by-light avionics systems
[AIAA PAPER 85-6002] p 47 A86-11439
**DIRECTIONAL SOLIDIFICATION (CRYSTALS)**
Directionally solidified blade superalloy DZ-22
p 52 A86-12314
**DISCONNECT DEVICES**
AIRBOC (air rapid bloom offboard chaff) chaff deployment system
[AD-D011746] p 60 N86-10554
**DISPLAY DEVICES**
Portable tactical display systems for RPV's
p 48 A86-10376
Simulation evaluation of display/FLIR concepts for low-altitude, terrain-following helicopter operations
[AIAA PAPER 85-3093] p 34 A86-10945
**DISTORTION**
Inlet flow dynamic distortion prediction without rms measurements p 19 N86-11183
**DOCUMENTATION**
Let's get serious about software
[AD-A156819] p 70 N86-10831
**DOPPLER NAVIGATION**
Doppler navigation and the RPV p 21 A86-10370
**DRAG CHUTES**
AIRBOC (air rapid bloom offboard chaff) chaff deployment system
[AD-D011746] p 60 N86-10554
**DRAG REDUCTION**
Numerical simulation of transonic flow over porous airfoils
[AIAA PAPER 85-5022] p 11 A86-11070
Viscous drag reduction with microporous-faced honeycomb sandwich for modern turbofan installations
p 29 A86-11607
Oblique wing - New approach to an old problem
p 29 A86-11960
JetStar smoothes the way p 30 A86-12008
A study of the aerodynamic performance of Weis-Fogh wings p 17 N86-10012
**DRONE AIRCRAFT**
Operational philosophy of international full-scale aerial targets p 1 A86-10357
**DUCTS**
Application of Gr/PMR-15 to commercial aircraft
p 54 N86-11289
**DURABILITY**
Gas side heat transfer p 62 N86-11507
**DYNAMIC CHARACTERISTICS**
Dynamic behavior of a propfan p 43 N86-11159
**DYNAMIC CONTROL**
A dynamic analysis of the dimensional chains of aircraft control systems p 47 A86-12554
**DYNAMIC MODELS**
Ground resonance analysis using a substructure modeling approach p 25 A86-11152
Nonlinear dynamics of a helicopter model in ground resonance p 25 A86-11154
Test results from a dynamic model Dynaflex rotor
p 26 A86-11155
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover
p 26 A86-11156
Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 26 A86-11158
Modeling of the variable frontal stiffness of the rudder of a dynamically similar empennage model
p 47 A86-12552
**DYNAMIC PROGRAMMING**
Fundamental aspects of the theory of continuous Markovian controllable systems and the application of this theory --- Russian book p 70 A86-11535
**DYNAMIC RESPONSE**
A comparison of the NAVTOLAND (Navy vertical takeoff and landing) SH-2F helicopter model with the requirements of MIL-H-8501A and with flight data
[AD-A157297] p 33 N86-11198
**DYNAMIC STABILITY**
Dynamic stability of a bearingless circulation control rotor blade in hover p 27 A86-11167
Dynamic response characteristics of a circulation control rotor model pneumatic system p 28 A86-11168
**DYNAMIC STRUCTURAL ANALYSIS**
ADAM - An aeroservoelastic analysis method for analog or digital systems
[AIAA PAPER 85-3090] p 46 A86-10943
Servo-elastic oscillations - Control of transient dynamic motion of a plate p 56 A86-11344
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A147304] p 3 N86-10001
Optimum design of an aircraft wing structure with multiple constraints by the direct-vision criteria method
p 30 N86-10004
**DYNAMIC TESTS**
An analysis of two methods for analysis of dynamic flight test manoeuvres p 45 A86-10160
**DYNAMICAL SYSTEMS**
Stochastic dynamic system suboptimal control with uncertain parameters p 67 A86-10191
Structural identification of linear time-invariant dynamic systems under random inputs p 70 A86-11597

## E

**EARTH RESOURCES**
The dirigible: A catalyst for resource exploitation in remote areas?
[AD-A156518] p 31 N86-10034
**EDGES**
Finite difference solutions of the Euler equations in the vicinity of sharp edges p 12 A86-11255
**EDUCATION**
A computer engineering curriculum for the Air Force Academy: An implementation plan
[AD-A156464] p 70 N86-11857
**EFFECTIVE PERCEIVED NOISE LEVELS**
The effect of changes in aircraft noise exposure
p 65 A86-12447
**ELASTIC BODIES**
Thermoelastic and electromagnetic damping analysis
p 56 A86-11246
**ELASTIC PLATES**
An assessment of the effect of corrosion wear on the stressed state and durability of plates and shells
p 58 A86-12536
**ELASTOPLASTICITY**
Application of the local strain method to fatigue life estimation of a wing main beam specimen
p 55 A86-10620
**ELECTRIC WIRE**
WIT - Test system for the MD-80s --- Wire Integrity Test for avionics of commercial aircraft
[AIAA PAPER 85-5082] p 34 A86-11428
**ELECTRICAL RESISTANCE**
High temperature static strain sensor development program p 62 N86-11500
Demonstration test of burner liner strain measurement systems: Interim results p 62 N86-11501
**ELECTROMAGNETIC FIELDS**
Thermoelastic and electromagnetic damping analysis
p 56 A86-11246
**ELECTROMAGNETIC PROPERTIES**
Electromagnetic resonances of cylinders and aircraft model with resistive wires
[NASA-CR-176250] p 32 N86-10042
**ELECTROMAGNETIC PULSES**
An overview of EMP effects and their control
p 58 A86-12074
**ELECTRON MICROSCOPY**
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231] p 31 N86-10033
**ELECTRONIC COUNTERMEASURES**
Submerged ram air inlets for ECM (electronic countermeasures) pods
[AD-D011801] p 18 N86-10020
**ELECTRONIC EQUIPMENT**
Operational and support considerations in standardization --- military avionics
[AIAA PAPER 85-5063] p 56 A86-11416
An overview of EMP effects and their control
p 58 A86-12074
Simulated direct-strike lightning testing at Sandia National Laboratories
[DE85-012033] p 49 N86-10049
**ELECTRONIC PACKAGING**
New directions in aerospace packaging --- of electronics
[AIAA PAPER 85-6033] p 56 A86-11457
**ELECTRONIC WARFARE**
Tactical jamming p 21 A86-12300

**ELEVATION**
CRC control systems laboratory gyro test facility [CRC-1385] p 49 N86-11205
**EMBEDDED COMPUTER SYSTEMS**
Algebraic polynomial approximation in the LSQ sense of a family of curves [AIAA PAPER 85-6026] p 69 A86-11455
A computer engineering curriculum for the Air Force Academy: An implementation plan [AD-A156464] p 70 N86-11857
**ENERGY CONSERVATION**
Computational fluid dynamics - Its present status and future direction p 55 A86-10267
**ENGINE AIRFRAME INTEGRATION**
Integrated flight/propulsion control - Methodology, design, and evaluation [AIAA PAPER 85-3048] p 36 A86-10927
Some considerations in propeller and airframe integration p 44 N86-11164
Problems of the integration of propellers in airframes, especially for high performance twin-engine aircraft p 44 N86-11165
**ENGINE CONTROL**
Integrated flight/propulsion control - Methodology, design, and evaluation [AIAA PAPER 85-3048] p 36 A86-10927
**ENGINE COOLANTS**
Transportation and impingement/effusion cooling of gas turbine combustion chambers p 40 A86-11697
**ENGINE DESIGN**
Versatile, low cost turbojet propulsion for unmanned vehicles p 35 A86-10360
The status of a low cost gas turbine programme p 35 A86-10362
Study of turbine bypass remote augmentor lift system for V/STOL aircraft [AIAA PAPER 85-3086] p 36 A86-10941
Design and development of a power takeoff (PTO) shaft for the X-29 Forward Swept Wing (FSW) demonstrator aircraft [AIAA PAPER 85-4045A] p 36 A86-10971
Aircraft gas-turbine engines in ground-based applications --- Russian book p 57 A86-11554
International Symposium on Air Breathing Engines, 7th, Beijing, People's Republic of China, September 2-6, 1985, Proceedings p 36 A86-11601
The role of computational technic in the development of high performance airbreathing engines p 37 A86-11603
Aero gas turbine engines for commercial application p 37 A86-11604
Combustion engineering and research for gas turbines p 37 A86-11608
Development of new combustor technologies at SNECMA p 37 A86-11610
Ramjet research in France - Realities and perspectives [ONERA, TP NO. 1985-108] p 38 A86-11624
The history and foreseeable developments in reciprocating engines for aircraft p 3 A86-11647
A study on performances of variable geometry turbofan engines utilizing an approximated analytical method p 38 A86-11648
Design characteristics of a new generation turboshaft engine p 38 A86-11649
The aerodynamic and thermodynamic design of a small turbojet p 38 A86-11650
Turbulent boundary layer separation on engine components p 14 A86-11675
Experimental results from a reverse flow annual combustor p 57 A86-11696
Aerojet TechSystems develops hypersonic aircraft engine p 40 A86-11955
Tay for two p 40 A86-12010
Propeller power p 40 A86-12365
A study of the effect of rotor blading parameters on the region of acceptable design solutions for the attachment of aircraft compressor blades p 41 A86-12544
Representation of a turbine profile in the form of a Bezier curve p 15 A86-12551
Assuring the reliability of aircraft engines p 41 A86-12599
Development of modern turboprop engines p 45 N86-11168
Current and future engine applications of Gr/PI composites p 54 N86-11291
**ENGINE FAILURE**
Deposits in aircraft engines. I - Type of deposits and test methods p 40 A86-11757
A method for designing a surge protection device for gas turbine engines p 40 A86-12541
**ENGINE INLETS**
Three-dimensional flow effects in a two-dimensional air intake with mixed supersonic compression p 13 A86-11612
**ENGINE MONITORING INSTRUMENTS**
Engine performance monitoring in helicopters p 39 A86-11661
Procedures for trending aircraft gas turbine engine performance p 39 A86-11662
Certain algorithms related to 'engine condition monitoring' systems p 39 A86-11664
Trials on the asperity counting monitoring system --- helicopter gearboxes [RES-PAPER-670] p 59 N86-10550
**ENGINE NOISE**
Development of a short radial diffuser in the high subsonic and supersonic range with special application to air breathing engines p 14 A86-11639
**ENGINE PARTS**
Integrated systems for component specific design and analysis [AIAA PAPER 85-3097] p 68 A86-10946
Optimisation of recess-action conformal profiles for aero gas-turbine engine gears - A computer based analytical approach p 57 A86-11617
Unsteady operation of the fuel nozzles of the main combustion chamber of a gas-turbine engine p 41 A86-12549
AE monitoring of jet engine breech chambers p 59 A86-12561
Assuring the reliability of aircraft engines p 41 A86-12599
Turbine Engine Hot Section Technology (HOST) [NASA-CP-2289] p 61 N86-11495
High temperature static strain sensor development program p 62 N86-11500
**ENGINE TESTING LABORATORIES**
Real-time engine testing in the Aeropropulsion Systems Test Facility p 38 A86-11646
**ENGINE TESTS**
A simple method for evaluating thermal stability of labyrinth seals p 57 A86-11621
Engine performance monitoring in helicopters p 39 A86-11661
JT9D engine/module performance deterioration results from back to back testing p 39 A86-11663
Determination of the thrust of a bypass engine under operating conditions p 41 A86-12546
A study of a turbine stage with a twisted vaned diffuser p 41 A86-12548
Development of modern turboprop engines p 45 N86-11168
**ENTROPY**
Entropy corrections to supersonic conical nonlinear potential flows p 4 A86-10271
**ENVIRONMENT EFFECTS**
Hostile atmospheric environment effects on jet engines p 39 A86-11665
**ENVIRONMENTAL TESTS**
An overview of EMP effects and their control p 58 A86-12074
**EPOXY RESINS**
Evaluation of experimental epoxy monomers p 51 A86-11397
Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270
**EQUATIONS OF MOTION**
Determination of the order and structure of the linear differential equations of aircraft motion from experimental results p 47 A86-12535
**EQUIPMENT SPECIFICATIONS**
Design standards for unmanned airvehicles (UMAV) p 22 A86-10365
Operational and support considerations in standardization --- military avionics [AIAA PAPER 85-5063] p 56 A86-11416
Specification and review of flight critical digital systems [AIAA PAPER 85-5097] p 46 A86-11437
**ETHYLENE**
Flight worthiness of fire resistant hydraulic systems: Volume 1 [AD-A157618] p 33 N86-11199
**EULER EQUATIONS OF MOTION**
An investigation of gridding on the accuracy of FLO57MM and FLO57MG Euler wing solutions [AIAA PAPER 85-4090] p 9 A86-11050
Comparison of results from a panel method and an Euler code for a cranked delta wing [AIAA PAPER 85-4091] p 9 A86-11051
Flow simulations for detailed nacelle-exhaust flow using Euler equations [AIAA PAPER 85-5003] p 10 A86-11058
Computational estimations of strut support interference at transonic Mach numbers [AIAA PAPER 85-5018] p 11 A86-11066
Finite difference solutions of the Euler equations in the vicinity of sharp edges p 12 A86-11255
Three-dimensional solutions to the Euler equations with one million grid points p 15 A86-12062
On the design of airfoils in transonic flow using the Euler equations p 17 N86-10013
Aerodynamics of wide-chord propellers in non-axisymmetric flow p 42 N86-11153
**EXHAUST EMISSION**
Initial dispersion of jet engine exhaust plume p 39 A86-11666
HOST liner cyclic facilities p 63 N86-11519
**EXHAUST FLOW SIMULATION**
Supersonic wind tunnel simulation of propulsive jets p 4 A86-10021
Flow simulations for detailed nacelle-exhaust flow using Euler equations [AIAA PAPER 85-5003] p 10 A86-11058
**EXHAUST GASES**
Combustion and emissions performance of a rapid fuel and air mixing combustor p 52 A86-11698
**EXHAUST VELOCITY**
Acta Aeronautica et Astronautica Sinica (selected articles) [AD-A147304] p 3 N86-10001
Theoretical specific impulse for two-phase flow in nozzle of rocket-ramjet engine: A simple estimation method p 51 N86-10005
**EXPERT SYSTEMS**
PAN AIR consultations using expert system techniques --- computational fluid dynamics tool for aircraft design [AIAA PAPER 85-4094] p 68 A86-11053
Expert systems development and application [NASA-TM-86746] p 32 N86-11194
Description of an experimental expert system flight status monitor [NASA-TM-86791] p 32 N86-11195
**EXTERNALLY BLOWN FLAPS**
Maximum circulation lift coefficient developed on a low aspect ratio wing with a blown flap [AIAA PAPER 85-3085] p 6 A86-10940

## F

**F-15 AIRCRAFT**
Runway and maneuvering performance enhanced p 29 A86-11958
Evaluation of fault reporting/fault isolation for F-15 aircraft [AD-A156516] p 33 N86-11197
**F-18 AIRCRAFT**
Approach and landing thrust reverser testing in ground effect [AIAA PAPER 85-3075] p 23 A86-10935
**FABRICATION**
Some fabrication experiments towards a composite RPV wing p 51 A86-10364
Characteristics of the design and fabrication of large aircraft components in composite materials p 30 A86-12545
**FAILURE ANALYSIS**
Diagnosis and cure for a fatigue problem in the turbine rotor of a small turbo-engine p 38 A86-11623
Turbine Engine Hot Section Technology (HOST) [NASA-CP-2289] p 61 N86-11495
Hot section viewing system p 61 N86-11498
**FAR FIELDS**
Summary of work on jet noise prediction [ESDU-BR-62636] p 71 N86-10909
**FATIGUE (MATERIALS)**
A review of Australian investigations on aeronautical fatigue during the period April 1983 to March 1985 [AD-A156602] p 31 N86-10036
Review of investigations on aeronautical fatigue in the Federal Republic of Germany [LBF-S-173] p 32 N86-10044
Fatigue, static tensile strength and stress corrosion of aircraft materials and structures [VTH-LR-360-PT-1] p 32 N86-10045
Fatigue of graphite/epoxy buffer strip panels with center cracks [NASA-TM-87595] p 60 N86-10581
Turbine Engine Hot Section Technology (HOST) [NASA-CP-2289] p 61 N86-11495
**FATIGUE LIFE**
Application of the local strain method to fatigue life estimation of a wing main beam specimen p 55 A86-10620
Determination of high cycle fatigue life of axial compressor blades of turbojet engines fitted in military aircraft p 37 A86-11618
Diagnosis and cure for a fatigue problem in the turbine rotor of a small turbo-engine p 38 A86-11623
A review of Australian investigations on aeronautical fatigue during the period April 1983 to March 1985 [AD-A156602] p 31 N86-10036
Life prediction and constitutive behavior p 64 N86-11520

Creep fatigue life prediction for engine hot section materials (isotropic) p 64 N86-11521

**FAULT TOLERANCE**

Fault effect protection and partitioning for fly-by-wire/fly-by-light avionics systems
[AIAA PAPER 85-6002] p 47 A86-11439

Performance analysis of a fault inferring nonlinear detection system algorithm with integrated avionics flight data
[AIAA PAPER 85-6022] p 69 A86-11452

**FIBER COMPOSITES**

Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**FIBER REINFORCED COMPOSITES**

Surface protection of graphite fabric/PMR-15 composites subjected to thermal oxidation
p 53 N86-11281

Effects of real-time thermal aging on graphite/polyimide composites p 53 N86-11283

Development of design data for propulsion PMR-15 composites p 54 N86-11285

Application of Gr/PMR-15 to commercial aircraft
p 54 N86-11289

Fabrication process of a high temperature polymer matrix engine duct p 54 N86-11290

Current and future engine applications of Gr/PI composites p 54 N86-11291

**FIGHTER AIRCRAFT**

Integrated flowfield analysis methodology for fighter inlets
[AIAA PAPER 85-3071] p 5 A86-10933

Subsonic diffuser design and performance for advanced fighter aircraft
[AIAA PAPER 85-3073] p 5 A86-10934

A computer-assisted process for supersonic aircraft conceptual design
[AIAA PAPER 85-4027] p 23 A86-10958

A parametric evaluation of supersonic STOVL
[SAE PAPER 851170] p 25 A86-10974

Full potential and Euler solutions for the unsteady transonic flow past a fighter wing
[AIAA PAPER 85-4061] p 7 A86-11031

Prediction of fighter aircraft dynamic derivatives using Digital Datcom
[AIAA PAPER 85-4070] p 25 A86-11036

Computational wing design in support of an NLF variable sweep transition flight experiment --- Natural Laminar Flow
[AIAA PAPER 85-4074] p 7 A86-11039

Performance of a top-mounted inlet system applied on two combat aircraft concepts p 29 A86-11614

System modeling and identification of equivalent systems with and without compensating time delay for control-augmented aircraft
[ESA-TT-852] p 32 N86-10043

Let's get serious about software
[AD-A156819] p 70 N86-10831

**FILAMENT WINDING**

Filament winding - Waking the sleeping giant
p 54 A86-10146

**FINITE DIFFERENCE THEORY**

Second-order-accurate spatial differencing for the transonic small-disturbance equation p 12 A86-11233

Finite difference solutions of the Euler equations in the vicinity of sharp edges p 12 A86-11255

Second order approximation method for transonic flows over swept wings p 16 N86-10002

**FINITE ELEMENT METHOD**

Planning, creating and documenting a NASTRAN finite element model of a modern-helicopter
p 28 A86-11170

Burner liner thermal/structural load modelling
p 63 N86-11514

A comparison of measured and calculated thermal stresses in a hybrid metal matrix composite spar cap element
[NASA-TM-86729] p 64 N86-11525

**FINITE VOLUME METHOD**

Flow-field computations around nozzle/afterbody configurations at transonic Mach numbers
[AIAA PAPER 85-4081] p 8 A86-11044

Three-dimensional calculation of transonic viscous flows by an implicit method p 12 A86-11230

**FIRES**

Flight worthiness of fire resistant hydraulic systems: Volume 1
[AD-A157618] p 33 N86-11199

**FLAME HOLDERS**

On the relationship between flame stability and drag of bluff-body flameholders p 51 A86-11645

**FLAME STABILITY**

On the relationship between flame stability and drag of bluff-body flameholders p 51 A86-11645

**FLAPS (CONTROL SURFACES)**

AIRBOC (air rapid bloom offboard chaff) chaff deployment system
[AD-D011746] p 60 N86-10554

**FLAT PLATES**

Servo-elastic oscillations - Control of transient dynamic motion of a plate p 56 A86-11344

Three articles on new calculation methods in aeronautics (selected articles)
[AD-A145745] p 3 N86-10007

Numerical solution of hypersonic flow near leading edge of a flat plate p 16 N86-10008

**FLIGHT ALTITUDE**

A new characterization of the icing environment below 10,000 feet AGL from 7,000 miles of measurements in supercooled clouds p 66 N86-11743

**FLIGHT CHARACTERISTICS**

Development and application of mathematical models of aircraft --- Russian book p 29 A86-11945

Determination of the order and structure of the linear differential equations of aircraft motion from experimental results p 47 A86-12535

The problem of selecting the parameters of a flight vehicle on the basis of the motion stability requirement
p 47 A86-12540

Mission-oriented requirements for updating MIL-H-8501: Calspan proposed structure and rationale
[NASA-CR-177371] p 48 N86-11204

Meteorological and Environmental Inputs to Aviation Systems
[NASA-CP-2388] p 66 N86-11735

A model of a downburst, a wind tunnel program on planetary boundary layer, and airship in turbulence
p 67 N86-11748

**FLIGHT CONDITIONS**

Mission-oriented requirements for updating MIL-H-8501: Calspan proposed structure and rationale
[NASA-CR-177371] p 48 N86-11204

Overview of meteorological inputs to NASP
p 66 N86-11736

Airline meteorological requirements
p 66 N86-11737

General aviation's meteorological requirements
p 66 N86-11738

Corporate/commuter airlines meteorological requirements p 66 N86-11739

Overview of NASA's programs p 66 N86-11741

Adverse weather impact on aviation safety, investigation and oversight p 66 N86-11742

Advance particle and Doppler measurement methods
p 67 N86-11745

**FLIGHT CONTROL**

Integrated flight/propulsion control - Methodology, design, and evaluation
[AIAA PAPER 85-3048] p 36 A86-10927

Modeling vehicle dynamics for flying qualities studies
[AIAA PAPER 85-3062] p 46 A86-10931

A rapid evaluation approach for configuration development of new aircraft
[AIAA PAPER 85-3068] p 22 A86-10932

Digital flight control of longitudinally unstable aircraft
[AIAA PAPER 85-3088] p 46 A86-10942

Prediction of fighter aircraft dynamic derivatives using Digital Datcom
[AIAA PAPER 85-4070] p 25 A86-11036

Predicate/transition network analysis of redundant channel synchronization
[AIAA PAPER 85-6020] p 69 A86-11450

Methodology of the flight testing of the flight-control and navigation equipment of aircraft and helicopters --- Russian book p 21 A86-12046

Expert systems development and application
[NASA-TM-86746] p 32 N86-11194

Description of an experimental expert system flight status monitor
[NASA-TM-86791] p 32 N86-11195

**FLIGHT HAZARDS**

Hostile atmospheric environment effects on jet engines p 39 A86-11665

Accident investigation p 20 A86-12011

Meteorological and Environmental Inputs to Aviation Systems
[NASA-CP-2388] p 66 N86-11735

Overview of FAA's aircraft icing program
p 66 N86-11740

Overview of NASA's programs p 66 N86-11741

Adverse weather impact on aviation safety, investigation and oversight p 66 N86-11742

A new characterization of supercooled clouds below 10,000 feet AGL p 66 N86-11744

Development of a wind shear performance envelope
p 67 N86-11746

**FLIGHT INSTRUMENTS**

Performance analysis of a fault inferring nonlinear detection system algorithm with integrated avionics flight data
[AIAA PAPER 85-6022] p 69 A86-11452

**FLIGHT MANAGEMENT SYSTEMS**

Integrated Flight Data Processing System - Support for the discipline engineer
[AIAA PAPER 85-4042] p 25 A86-10970

Mission-adaptive wing camber control systems for transport aircraft
[AIAA PAPER 85-5006] p 46 A86-11061

Multiprocessor application in flight management systems
[AIAA PAPER 85-5079] p 34 A86-11425

Fault effect protection and partitioning for fly-by-wire/fly-by-light avionics systems
[AIAA PAPER 85-6002] p 47 A86-11439

**FLIGHT OPTIMIZATION**

Oblique wing - New approach to an old problem
p 29 A86-11060

**FLIGHT PATHS**

Generation of flight paths using hierarchical planning
[AD-A156905] p 70 N86-10900

**FLIGHT SIMULATION**

Simulation evaluation of display/FLIR concepts for low-altitude, terrain-following helicopter operations
[AIAA PAPER 85-3093] p 34 A86-10945

Manned flight simulation: Challenge and response
[NASA-TM-86827] p 49 N86-10048

A comparison of the NAVTOLAND (Navy vertical takeoff and landing) SH-2F helicopter model with the requirements of MIL-H-8501A and with flight data
[AD-A157297] p 33 N86-11198

Visual and motion cueing in helicopter simulation
[NASA-TM-86818] p 50 N86-11208

**FLIGHT SIMULATORS**

Modeling vehicle dynamics for flying qualities studies
[AIAA PAPER 85-3062] p 46 A86-10931

Development and usage of a small-scale V/STOL ground effects simulator
[AIAA PAPER 85-4037] p 49 A86-10966

**FLIGHT STABILITY TESTS**

The problem of selecting the parameters of a flight vehicle on the basis of the motion stability requirement
p 47 A86-12540

**FLIGHT TESTS**

An analysis of two methods for analysis of dynamic flight test manoeuvres p 45 A86-10160

Operational philosophy of international full-scale aerial targets p 1 A86-10357

Methodology of the flight testing of the flight-control and navigation equipment of aircraft and helicopters --- Russian book p 21 A86-12046

Full-scale testing of the VNII NP-261 lubricant
p 53 A86-12607

Expert systems development and application
[NASA-TM-86746] p 32 N86-11194

Description of an experimental expert system flight status monitor
[NASA-TM-86791] p 32 N86-11195

**FLIR DETECTORS**

Simulation evaluation of display/FLIR concepts for low-altitude, terrain-following helicopter operations
[AIAA PAPER 85-3093] p 34 A86-10945

**FLOQUET THEOREM**

Flap-lag-torsion stability in forward flight
p 27 A86-11166

**FLOW CHARACTERISTICS**

Prediction of outlet flow characteristics of centrifugal impellers. I - Consideration of velocity distortion
p 55 A86-10481

Design concept and performance prediction technique for potential flows around advanced propellers
p 42 N86-11150

**FLOW DEFLECTION**

Bounded flow past a supercavitating finite-span wing
p 5 A86-10729

Nonsymmetric solutions in the problem of flow past a plate with a pair of vortex-sink combinations
p 5 A86-10735

Numerical experiment with inviscid vortex-stretched flow around a cranked delta wing - Subsonic speed
[AIAA PAPER 85-4080] p 8 A86-11043

Symmetric separated flow past slender bodies at angles of attack in subsonic and supersonic flows
[AIAA PAPER 85-5007] p 10 A86-11062

**FLOW DISTORTION**

A study of aerodynamic performance of diffusers for centrifugal compressors p 15 A86-12266

Characteristics of the flow around rectangular cylinders - The case of the angle of attack 0 deg
p 15 A86-12271

Turbulence characteristics of a plane diffuser flow with inlet velocity distortion p 59 A86-12608

**FLOW DISTRIBUTION**

Study on design of a supersonic nozzle. I - Improvement of a calculating method for a flowfield of mixed type p 5 A86-10480

Integrated flowfield analysis methodology for fighter inlets [AIAA PAPER 85-3071] p 5 A86-10933

Ground effects on V/STOL and STOL aircraft - A survey [AIAA PAPER 85-4033] p 24 A86-10962

Calculation of external and internal transonic flow field of a three-dimensional S-shaped inlet p 13 A86-11616

An experimental study of the compressor rotor flow field at off-design condition using laser Doppler velocimeter p 13 A86-11636

Inviscid flow field analysis of maneuvering hypersonic vehicles using the SCM formulation and parabolic grid generation [DE85-013950] p 18 N86-10021

Experimental and theoretical investigations of the flow around airfoil systems with ground effect [DFVLR-FB-85-17] p 19 N86-10026

A review of ARA research into propeller aerodynamic prediction methods p 42 N86-11151

A unified approach for the aerodynamics and acoustics of propellers in forward motion p 42 N86-11155

A general theory of arbitrary motion aerodynamics using an aeroacoustic approach p 43 N86-11157

Summary of recent NASA propeller research p 43 N86-11158

Study of the 3D wake of an aerial propeller p 43 N86-11161

Ground effect on a rotor wake [COLL-AERONAUTICS-8510] p 19 N86-11187

Assessment of a 3-D boundary layer code to predict heat transfer and flow losses in a turbine p 62 N86-11508

**FLOW EQUATIONS**

Calculation of external and internal transonic flow field of a three-dimensional S-shaped inlet p 13 A86-11616

**FLOW GEOMETRY**

Nonsymmetric solutions in the problem of flow past a plate with a pair of vortex-sink combinations p 5 A86-10735

Laser Doppler velocimeter measurements in a 3-D impinging twin-jet fountain flow [AIAA PAPER 85-4036] p 6 A86-10965

The shock patterns in the two-dimensional inlet with a bleed p 13 A86-11611

Performance of a top-mounted inlet system applied on two combat aircraft concepts p 29 A86-11614

The governing influence of the nose radius on the unsteady effects of large scale flow structure in the turbulent wing and plate junction flow p 14 A86-11912

**FLOW MEASUREMENT**

Comparison of predicted and measured drag for a single-engine airplane [AIAA PAPER 85-4038] p 24 A86-10967

An experimental study of the compressor rotor flow field at off-design condition using laser Doppler velocimeter p 13 A86-11636

Concentration distributions in cylindrical combustors p 58 A86-11937

Scalar and momentum turbulent transport experiments with swirling and nonswirling flows p 58 A86-11938

Experimental study of vortex breakdown on a delta wing in incompressible flow [ONERA, TP NO 1985-107] p 15 A86-12283

**FLOW RESISTANCE**

Aerodynamic resistance of perforated plates in natural convection p 58 A86-12272

**FLOW THEORY**

Dynamic response characteristics of a circulation control rotor model pneumatic system p 26 A86-11168

**FLOW VISUALIZATION**

The pitching delta wing p 12 A86-11227

Three-dimensional flow effects in a two-dimensional air intake with mixed supersonic compression p 13 A86-11612

**FLUID FILLED SHELLS**

A technical-economical analysis of airships of various sizes, shapes, and gas permeability of the shell p 30 A86-12530

**FLUID MECHANICS**

A measurement method to evaluate fluid force on blades p 58 A86-12276

**FLUTTER**

The effect of acoustically lined walls on cascade flutter p 36 A86-10477

**FLUTTER ANALYSIS**

Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover p 26 A86-11156

Mode interaction Hopf bifurcation in axisymmetric shells p 56 A86-11343

Unsteady aerodynamic characteristics of a blade in pitching oscillations with flow separation. I - The case with laminar separation bubble. II - The case with leading edge stall. III - The case near the stalling angle of attack p 15 A86-12263

Flutter analysis of a thin-walled lifting surface p 58 A86-12528

Modeling of the variable frontal stiffness of the rudder of a dynamically similar empennage model p 47 A86-12552

**FLY BY WIRE CONTROL**

Modeling vehicle dynamics for flying qualities studies [AIAA PAPER 85-3062] p 46 A86-10931

Fault effect protection and partitioning for fly-by-wire/fly-by-light avionics systems [AIAA PAPER 85-6002] p 47 A86-11439

**FORCE DISTRIBUTION**

A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear [NASA-TP-2481] p 64 N86-11522

**FOREBODIES**

Integrated flowfield analysis methodology for fighter inlets [AIAA PAPER 85-3071] p 5 A86-10933

**FRACTURE MECHANICS**

Stress analyses of B-52 pylon hooks [NASA-TM-84924] p 64 N86-11524

**FRACTURE STRENGTH**

On flaw size and distribution in lap joints p 57 A86-11755

Fatigue of graphite/epoxy buffer strip panels with center cracks [NASA-TM-87595] p 60 N86-10581

**FREE CONVECTION**

Aerodynamic resistance of perforated plates in natural convection p 58 A86-12272

**FREE FLOW**

The separated and non-separated airfoil wake behavior in the presence of free stream turbulence [AIAA PAPER 85-5027] p 11 A86-11073

The role of freestream turbulence scale in subsonic flow separation [NASA-CR-176237] p 17 N86-10014

**FREQUENCY RESPONSE**

A study of the frequency response of a turbojet engine to turbulence-type dynamic distortion p 39 A86-11693

**FRICTION DRAG**

JetStar smoothes the way p 30 A86-12008

**FUEL CONSUMPTION**

Configuration studies for fuel-efficiency maximisation [AIAA PAPER 85-4032] p 24 A86-10961

A study on performances of variable geometry turbofan engines utilizing an approximated analytical method p 38 A86-11648

JetStar smoothes the way p 30 A86-12008

**FUEL INJECTION**

Combustion and emissions performance of a rapid fuel and air mixing combustor p 52 A86-11698

Unsteady operation of the fuel nozzles of the main combustion chamber of a gas-turbine engine p 41 A86-12549

High-speed laser photorecording of a fuel nozzle jet p 41 A86-12555

**FUEL SYSTEMS**

User's manual for AC-20-53A protection of airplane fuel systems against fuel vapor ignition due to lightning [AD-A157619] p 20 N86-11191

**FUELS**

Retrofit of SAC EC-135C and RC-135 aircraft with CFM-56 engines [AD-A156688] p 31 N86-10038

**FULL SCALE TESTS**

Operational philosophy of international full-scale aerial targets p 1 A86-10357

Full-scale testing of the VNII NP-261 lubricant p 53 A86-12607

Performance evaluation of full scale propellers by wind tunnel test p 43 N86-11160

**FUSELAGES**

Performance of a top-mounted inlet system applied on two combat aircraft concepts p 29 A86-11614

Effect of the Reynolds number on the aerodynamic characteristics of an ogive-cylinder at high angle of attack p 14 A86-12022

Proposed modifications for the RAAF Airtrainer CT-4A cockpit [AD-A156806] p 31 N86-10039

The state of the art in propfan turboprop noise p 72 N86-11175

## G

**GANTRY CRANES**

Design of static reaction gantry for an ultralight airplane destruction test [AIAA PAPER 85-4022] p 49 A86-10955

**GAS GENERATORS**

Development of modern turboprop engines p 45 N86-11168

**GAS JETS**

The concept of lateral blowing [AIAA PAPER 85-5000] p 9 A86-11055

**GAS PATH ANALYSIS**

JT9D engine/module performance deterioration results from back to back testing p 39 A86-11663

**GAS TEMPERATURE**

Dynamic gas temperature measurement system p 62 N86-11499

**GAS TURBINE ENGINES**

Present and future trends in turbojets and turbofans for R.P.V's p 35 A86-10361

The status of a low cost gas turbine programme p 35 A86-10362

Integrated systems for component specific design and analysis [AIAA PAPER 85-3097] p 68 A86-10946

Aircraft gas-turbine engines in ground-based applications --- Russian book p 57 A86-11554

Aero gas turbine engines for commercial application p 37 A86-11604

Combustion engineering and research for gas turbines p 37 A86-11608

Combustion research for gas turbine engines p 37 A86-11609

Optimisation of recess-action conformal profiles for aero gas-turbine engine gears - A computer based analytical approach p 57 A86-11617

A simple method for evaluating thermal stability of labyrinth seals p 57 A86-11621

Diagnosis and cure for a fatigue problem in the turbine rotor of a small turbo-engine p 38 A86-11623

Procedures for trending aircraft gas turbine engine performance p 39 A86-11662

JT9D engine/module performance deterioration results from back to back testing p 39 A86-11663

Problems of ignition correlations - An assessment of applications to real combustors p 52 A86-11694

Experimental results from a reverse flow annual combustor p 57 A86-11696

Transportation and impingement/effusion cooling of gas turbine combustion chambers p 40 A86-11697

Combustion and emissions performance of a rapid fuel and air mixing combustor p 52 A86-11698

Repair of air-cooled turbine vanes of high-performance aircraft engines - Problems and experience p 3 A86-11872

State-of-art and prospects of casting turbine blades p 52 A86-12311

Directionally solidified blade superalloy DZ-22 p 52 A86-12314

The effect of the initial temperature nonuniformity and excess air ratio of the afterburner of a gas-turbine engine on the specific pulse of the nozzle p 40 A86-12531

A method for designing a surge protection device for gas turbine engines p 40 A86-12541

A study of the effect of rotor blading parameters on the region of acceptable design solutions for the attachment of aircraft compressor blades p 41 A86-12544

A study of a turbine stage with a twisted vaned diffuser p 41 A86-12548

Unsteady operation of the fuel nozzles of the main combustion chamber of a gas-turbine engine p 41 A86-12549

Turbine Engine Hot Section Technology (HOST) [NASA-CP-2289] p 61 N86-11495

Hot section viewing system p 61 N86-11498

Dynamic gas temperature measurement system p 62 N86-11499

High temperature static strain sensor development program p 62 N86-11500

Demonstration test of burner liner strain measurement systems: Interim results p 62 N86-11501

Development of heat flux sensors for turbine airfoils and combustor liners p 62 N86-11502

Turbine heat transfer p 62 N86-11505

Gas side heat transfer p 62 N86-11507

Jet array impingement heat transfer characteristics p 63 N86-11511

Combustion hot section technology p 45 N86-11512

Component-specific modeling p 45 N86-11515

The 3D inelastic analysis methods for hot section components p 63 N86-11516

The 3-D inelastic analysis methods for hot section components (base program) p 63 N86-11517

HOST liner cyclic facilities p 63 N86-11519

Life prediction and constitutive behavior p 64 N86-11520

Creep fatigue life prediction for engine hot section materials (isotropic) p 64 N86-11521

**GAS TURBINES**

Representation of a turbine profile in the form of a Bezier curve p 15 A86-12551

**GEAR TEETH**

Optimisation of recess-action conformal profiles for aero gas-turbine engine gears - A computer based analytical approach p 57 A86-11617

**GEARS**

Trials on the asperity counting monitoring system --- helicopter gearboxes [RES-PAPER-670] p 59 N86-10550

A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear [NASA-TP-2481] p 64 N86-11522

**GENERAL AVIATION AIRCRAFT**

General aviation cost effectiveness [AIAA PAPER 85-4029] p 73 A86-10959

Comparison of predicted and measured drag for a single-engine airplane [AIAA PAPER 85-4038] p 24 A86-10967

Investigations of modern general aviation propellers p 44 N86-11162

General aviation's meteorological requirements p 66 N86-11738

Corporate/commuter airlines meteorological requirements p 66 N86-11739

**GLASS**

Fatigue of graphite/epoxy buffer strip panels with center cracks [NASA-TM-87595] p 60 N86-10581

**GLASS FIBER REINFORCED PLASTICS**

Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270

**GOVERNMENT PROCUREMENT**

F-16X MSIP (Multi-national Staged Improvement Program) case example: Operating and support cost estimation using VAMOSC (Visibility And Management Of Operating and Support Costs) [AD-A156893] p 3 N86-10006

**GRAPHITE-EPOXY COMPOSITES**

Design and development of a power takeoff (PTO) shaft for the X-29 Forward Swept Wing (FSW) demonstrator aircraft [AIAA PAPER 85-4045A] p 36 A86-10971

Fatigue of graphite/epoxy buffer strip panels with center cracks [NASA-TM-87595] p 60 N86-10581

**GRAPHITE-POLYIMIDE COMPOSITES**

Effects of real-time thermal aging on graphite/polyimide composites p 53 N86-11283

Environmental stability graphite/PMR-15 composites p 53 N86-11284

Development of design data for propulsion PMR-15 composites p 54 N86-11285

Application of Gr/PMR-15 to commercial aircraft p 54 N86-11289

Fabrication process of a high temperature polymer matrix engine duct p 54 N86-11290

Current and future engine applications of Gr/PI composites p 54 N86-11291

**GROUND BASED CONTROL**

Construction and use of a radio controlled model helicopter for research [AD-A156547] p 31 N86-10035

**GROUND EFFECT (AERODYNAMICS)**

Approach and landing thrust reverser testing in ground effect [AIAA PAPER 85-3075] p 23 A86-10935

Ground effects on V/STOL and STOL aircraft - A survey [AIAA PAPER 85-4033] p 24 A86-10962

Ground effect and the helicopter - A summary [AIAA PAPER 85-4034] p 24 A86-10963

Unsteady thrust reverser effects in ground proximity [AIAA PAPER 85-4035] p 24 A86-10964

Development and usage of a small-scale V/STOL ground effects simulator [AIAA PAPER 85-4037] p 49 A86-10966

Experimental and theoretical investigations of the flow around airfoil systems with ground effect [DFVLR-FB-85-17] p 19 N86-10026

Ground effect on a rotor wake [COLL-AERONAUTICS-8510] p 19 N86-11187

**GROUND HANDLING**

A comparison of the NAVTOLAND (Navy vertical takeoff and landing) SH-2F helicopter model with the requirements of MIL-H-8501A and with flight data [AD-A157297] p 33 N86-11198

**GROUND RESONANCE**

Ground resonance analysis using a substructure modeling approach p 25 A86-11152

Nonlinear dynamics of a helicopter model in ground resonance p 25 A86-11154

Development and application of a time-history analysis for rotorcraft dynamics based on a component approach p 26 A86-11161

Influence of various unsteady aerodynamic models on the aeromechanical stability of a helicopter in ground resonance p 27 A86-11164

**GUIDANCE (MOTION)**

A comparison of the NAVTOLAND (Navy vertical takeoff and landing) SH-2F helicopter model with the requirements of MIL-H-8501A and with flight data [AD-A157297] p 33 N86-11198

**GUST LOADS**

Optimization of airplane wing structures under gust loads p 29 A86-11883

**GUSTS**

Forced response analysis of an aerodynamically detuned supersonic turbomachine rotor [NASA-TM-87093] p 18 N86-10019

**GYROSCOPES**

CRC control systems laboratory gyro test facility [CRC-1385] p 49 N86-11205

## H

**HANDBOOKS**

Coming soon to a theater near you: The microwave landing system [AD-A156468] p 20 N86-11190

Recognition and control of low level wind shear [AD-A156500] p 67 N86-11758

**HARMONIC CONTROL**

Adaptation of a modern medium helicopter (Sikorsky S-76) to Higher Harmonic Control p 28 A86-11173

**HARMONIC MOTION**

Theoretical study of the unsteady linear problem for a rectangular wing with a pitching movement [ONERA-RT-17/1841-RY-010-R] p 18 N86-10022

**HEAT EXCHANGERS**

Submerged ram air inlets for ECM (electronic countermeasures) pods [AD-D011801] p 18 N86-10020

**HEAT FLUX**

Development of heat flux sensors for turbine airfoils and combustor liners p 62 N86-11502

**HEAT RESISTANT ALLOYS**

State-of-art and prospects of casting turbine blades p 52 A86-12311

Directionally solidified blade superalloy DZ-22 p 52 A86-12314

**HEAT TRANSFER**

Assessment of a 3-D boundary layer code to predict heat transfer and flow losses in a turbine p 62 N86-11508

Coolant passage heat transfer with rotation. A progress report on the computational aspects p 63 N86-11510

Jet array impingement heat transfer characteristics p 63 N86-11511

HOST structural analysis program overview p 45 N86-11513

Burner liner thermal/structural load modelling p 63 N86-11514

Component-specific modeling p 45 N86-11515

Evaluation of a load cell model for dynamic calibration of the Rotor Systems Research Aircraft p 49 A86-11174

**HELICOPTER WAKES**

Ground effect on a rotor wake [COLL-AERONAUTICS-8510] p 19 N86-11187

**HELICOPTERS**

Ground resonance analysis using a substructure modeling approach p 25 A86-11152

Nonlinear dynamics of a helicopter model in ground resonance p 25 A86-11154

Helicopter noise p 71 A86-12025

Construction and use of a radio controlled model helicopter for research [AD-A156547] p 31 N86-10035

The quest for a helicopter suitable for combat rescue, 1967 - 1983 [AD-A156842] p 31 N86-10040

A comparative analysis of a CV helicopter and a JVX (Joint Services Advanced Vertical Lift) tilt-rotor aircraft in an aircraft carrier based ASW (Anti-Submarine Warfare) [AD-A156871] p 31 N86-10041

Trials on the asperity counting monitoring system --- helicopter gearboxes [RES-PAPER-670] p 59 N86-10550

Understanding and improving acoustic to seismic coupling as it pertains to Sandia's helicopter detector [DE85-009440] p 71 N86-10920

Comparison of calculated and measured velocities near the tip of a model rotor blade at transonic speeds [NASA-TM-86697] p 33 N86-11196

Visual and motion cueing in helicopter simulation [NASA-TM-86818] p 50 N86-11208

Aeroelastic model helicopter rotor testing in the Langley TDT [NASA-TM-86440] p 64 N86-11523

A new characterization of the icing environment below 10,000 feet AGL from 7,000 miles of measurements in supercooled clouds p 66 N86-11743

**HIERARCHIES**

Generation of flight paths using hierarchical planning [AD-A156905] p 70 N86-10900

**HIGH PRESSURE**

Hot section viewing system p 61 N86-11498

**HIGH REYNOLDS NUMBER**

Comparison of transonic airfoil characteristics by Navier-Stokes computation and by wind tunnel test at high Reynolds number [AIAA PAPER 85-5025] p 11 A86-11071

**HIGH SPEED PHOTOGRAPHY**

High-speed laser photorecording of a fuel nozzle jet p 41 A86-12555

**HIGH TEMPERATURE**

Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270

Turbine Engine Hot Section Technology (HOST) [NASA-CP-2289] p 61 N86-11495

Turbine engine Hot Section Technology (HOST) project p 61 N86-11496

Hot section viewing system p 61 N86-11498

Dynamic gas temperature measurement system p 62 N86-11499

Turbine heat transfer p 62 N86-11505

**HIGH TEMPERATURE TESTS**

Surface protection of graphite fabric/PMR-15 composites subjected to thermal oxidation p 53 N86-11281

Effects of real-time thermal aging on graphite/polyimide composites p 53 N86-11283

Environmental stability graphite/PMR-15 composites p 53 N86-11284

Fabrication process of a high temperature polymer matrix engine duct p 54 N86-11290

**HINGES**

Effect of hinge gap on aerodynamics of thin airfoils having an oscillating flap p 5 A86-10517

**HONEYCOMB CORES**

Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**HONEYCOMB STRUCTURES**

Viscous drag reduction with microporous-faced honeycomb sandwich for modern turbofan installations p 29 A86-11607

Adhesives for aerospace p 53 N86-11249

**HOOKS**

Stress analyses of B-52 pylon hooks [NASA-TM-84924] p 64 N86-11524

**HORIZONTAL FLIGHT**

Test results from a dynamic model Dynaflex rotor p 26 A86-11155

A review of dynamic inflow and its effect on experimental correlations p 27 A86-11163

The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 27 A86-11165

Flap-lag-torsion stability in forward flight p 27 A86-11166

**HOVERING**

Test results from a dynamic model Dynaflex rotor p 26 A86-11155

Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover p 26 A86-11156

A review of dynamic inflow and its effect on experimental correlations p 27 A86-11163

Dynamic stability of a bearingless circulation control rotor blade in hover p 27 A86-11167

**HUBS**

Evaluation of a load cell model for dynamic calibration of the Rotor Systems Research Aircraft p 49 A86-11174

**HUMAN FACTORS ENGINEERING**

Proposed modifications for the RAAF Airtrainer CT-4A cockpit [AD-A156808] p 31 N86-10039

**HYDRAULIC EQUIPMENT**

Flight worthiness of fire resistant hydraulic systems: Volume 1 [AD-A157618] p 33 N86-11199

**HYDRAULIC FLUIDS**

Flight worthiness of fire resistant hydraulic systems: Volume 1 [AD-A157618] p 33 N86-11199

**HYDROGEN ENGINES**

Aerojet TechSystems develops hypersonic aircraft engine p 40 A86-11955

**HYPERSONIC FLOW**

Theory of local interaction in a rarefied gas - Variant of the method of tangent cones p 5 A86-10658

Three articles on new calculation methods in aeronautics (selected articles) [AD-A145745] p 3 N86-10007

Numerical solution of hypersonic flow near leading edge of a flat plate p 16 N86-10008

Numerical procedure for three-dimensional hypersonic viscous flow over aerobrake configuration [NASA-TM-58269] p 18 N86-10018

Inviscid flow field analysis of maneuvering hypersonic vehicles using the SCM formulation and parabolic grid generation [DE85-013950] p 18 N86-10021

**HYPERSONIC VEHICLES**

Aerojet TechSystems develops hypersonic aircraft engine p 40 A86-11955

Inviscid flow field analysis of maneuvering hypersonic vehicles using the SCM formulation and parabolic grid generation [DE85-013950] p 18 N86-10021

Overview of FAA's aircraft icing program p 66 N86-11740

A new characterization of the icing environment below 10,000 feet AGL from 7,000 miles of measurements in supercooled clouds p 66 N86-11743

A new characterization of supercooled clouds below 10,000 feet AGL p 66 N86-11744

Advance particle and Doppler measurement methods p 67 N86-11745

**IGNITION**

User's manual for AC-20-53A protection of airplane fuel systems against fuel vapor ignition due to lightning [AD-A157619] p 20 N86-11191

**IGNITION LIMITS**

Problems of ignition correlations - An assessment of applications to real combustors p 52 A86-11694

**ILYUSHIN AIRCRAFT**

Reliability of wide-body aircraft p 59 A86-12600

**IMAGE ANALYSIS**

Area search rate and image interpreter performance --- for military RPV p 2 A86-10373

**IMAGE PROCESSING**

Vision-based road following for an autonomous land vehicle [AIAA PAPER 85-6047] p 57 A86-11461

**IMAGING TECHNIQUES**

Hot section viewing system p 61 N86-11498

**IMPELLERS**

Prediction of outlet flow characteristics of centrifugal impellers. I - Consideration of velocity distortion p 55 A86-10481

**IMPINGEMENT**

The generation of noise in impinging vortex motion past a step p 70 A86-10177

**IN-FLIGHT MONITORING**

Net thrust calculation sensitivity of an afterburning turbofan engine to variations in input parameters [AIAA PAPER 85-4041] p 36 A86-10969

Aircraft structure surveillance in-flight using acoustic emission p 35 A86-12572

In-flight AE monitoring p 59 A86-12573

In-flight monitoring for incipient cracks in an aero engine mount - An approach through pattern recognition p 35 A86-12574

**INCLUSIONS**

Temperature dependence of inclusion-fracture-related acoustic emissions in 7075-T651 aluminum p 52 A86-12584

**INCOMPRESSIBLE FLOW**

A vortex point method for calculating inviscid incompressible flows around rotary wings p 14 A86-12021

Experimental study of vortex breakdown on a delta wing in incompressible flow [ONERA, TP NO. 1985-107] p 15 A86-12283

Application of the vortex-lattice concept to flows with smooth-surface separation [AD-A157571] p 61 N86-11430

**INDUSTRIAL PLANTS**

The factory of the future p 60 N86-11228

**INERTIAL NAVIGATION**

Precise vertical speed reconstruction based on vertical acceleration and barometric altitude p 34 A86-11762

**INFLUENCE COEFFICIENT**

Net thrust calculation sensitivity of an afterburning turbofan engine to variations in input parameters [AIAA PAPER 85-4041] p 36 A86-10969

**INLET FLOW**

Integrated flowfield analysis methodology for fighter inlets [AIAA PAPER 85-3071] p 5 A86-10933

The shock patterns in the two-dimensional inlet with a bleed p 13 A86-11611

Performance of a top-mounted inlet system applied on two combat aircraft concepts p 29 A86-11614

Numerical simulation of self-excited oscillations in a ramjet inlet-diffuser flow p 13 A86-11615

Calculation of external and internal transonic flow field of a three-dimensional S-shaped inlet p 13 A86-11616

A study of the frequency response of a turbojet engine to turbulence-type dynamic distortion p 39 A86-11693

Turbulence characteristics of a plane diffuser flow with inlet velocity distortion p 59 A86-12608

Inlet flow dynamic distortion prediction without rms measurements p 19 N86-11183

**INLET PRESSURE**

Effect of a shear layer on the stability of an axisymmetrical external compression air intake p 16 N86-10010

**INPUT**

KRASH85 user's guide: input/output format [FAA-CT-85-10] p 70 N86-11898

**INSECTS**

A fundamental study of the sticking of insect residues to aircraft wings [NASA-CR-176231] p 31 N86-10033

**INSPECTION**

Nondestructive control of thick structures made without disassembling [PV-43-954/F/3] p 60 N86-10564

Adhesives for aerospace p 53 N86-11249

**INSTALLING**

WIT - Test system for the MD-80s --- Wire Integrity Test for avionics of commercial aircraft [AIAA PAPER 85-5082] p 34 A86-11428

**INSTRUCTION SETS (COMPUTERS)**

Is there a risc in the avionic computer future? --- Reduced Instruction Set Computers [AIAA PAPER 85-5081] p 34 A86-11427

**INSTRUMENT LANDING SYSTEMS**

Helicopter montage of a path antenna setup for the instrumental landing system SP 70 at Dresden airport p 49 A86-11775

**INSTRUMENT PACKAGES**

HOST instrumentation R and D program overview p 61 N86-11497

**INTAKE SYSTEMS**

Application of experimental and theoretical methods to validate results obtained on an isolated inlet cowl wind tunnel test rig [AIAA PAPER 85-5019] p 11 A86-11067

**INTERACTIONAL AERODYNAMICS**

Theory of local interaction in a rarefied gas - Variant of the method of tangent cones p 5 A86-10658

Analysis of leading-edge vortices on complex configurations [AIAA PAPER 85-4054] p 6 A86-11026

A direct-inverse transonic wing design-analysis method with viscous interactions [AIAA PAPER 85-4075] p 8 A86-11040

Numerical study of three-dimensional turbulent flow interactions between blockage models and wind tunnels including longitudinally slotted test sections [AIAA PAPER 85-5017] p 10 A86-11065

Aerodynamic interaction between vortical wakes and the viscous flow about a circular cylinder [AIAA PAPER 85-4063] p 12 A86-11096

A coupled inverse-inverse method for over-expanded supersonic nozzles [ONERA, TP NO. 1985-109] p 12 A86-11605

The governing influence of the nose radius on the unsteady effects of large scale flow structure in the turbulent wing and plate junction flow p 14 A86-11912

**INTERMODULATION**

Chemical bonding agent for suppression of rusty bolt intermodulation interference [AD-D011747] p 54 N86-11315

**INTERNATIONAL COOPERATION**

Cost and schedule implications of multinational coproduction --- of weapon systems [SAE PAPER 851150] p 73 A86-10972

**INVENTORY CONTROLS**

The factory of the future p 60 N86-11228

**INVISCID FLOW**

The generation of noise in impinging vortex motion past a step p 70 A86-10177

Computational fluid dynamics - Its present status and future direction p 55 A86-10267

Numerical experiment with inviscid vortex-stretched flow around a cranked delta wing - Subsonic speed [AIAA PAPER 85-4080] p 8 A86-11043

A vortex point method for calculating inviscid incompressible flows around rotary wings p 14 A86-12021

Three-dimensional inviscid analysis of radial turbine flow and a limited comparison with experimental data [NASA-TM-87091] p 17 N86-10017

Inviscid flow field analysis of maneuvering hypersonic vehicles using the SCM formulation and parabolic grid generation
[DE85-013950] p 18 N86-10021

**ITERATION**

Second order approximation method for transonic flows over swept wings p 16 N86-10002

## J

**JAMMING**

Tactical jamming p 21 A86-12300

**JET AIRCRAFT**

Inlet flow dynamic distortion prediction without rms measurements p 19 N86-11183

**JET AIRCRAFT NOISE**

Summary of work on jet noise prediction
[ESDU-BR-62636] p 71 N86-10909

**JET ENGINES**

Hostile atmospheric environment effects on jet engines p 39 A86-11665

AE monitoring of jet engine breech chambers
p 59 A86-12561

Retrofit of SAC EC-135C and RC-135 aircraft with CFM-56 engines
[AD-A156688] p 31 N86-10038

**JET EXHAUST**

Jet plume temperature effects on afterbody pressure distribution and drag p 13 A86-11606

Initial dispersion of jet engine exhaust plume
p 39 A86-11666

**JET FLOW**

Supersonic wind tunnel simulation of propulsive jets
p 4 A86-10021

High-speed laser photorecording of a fuel nozzle jet
p 41 A86-12555

**JET IMPINGEMENT**

Laser Doppler velocimeter measurements in a 3-D impinging twin-jet fountain flow
[AIAA PAPER 85-4036] p 6 A86-10965

Transportation and impingement/effusion cooling of gas turbine combustion chambers p 40 A86-11697

Jet array impingement heat transfer characteristics
p 63 N86-11511

**JET MIXING FLOW**

Combustion and emissions performance of a rapid fuel and air mixing combustor p 52 A86-11698

Concentration distributions in cylindrical combustors
p 58 A86-11937

Summary of work on jet noise prediction
[ESDU-BR-62636] p 71 N86-10909

**JET VANES**

Repair of air-cooled turbine vanes of high-performance aircraft engines - Problems and experience
p 3 A86-11872

Development of heat flux sensors for turbine airfoils and combustor liners p 62 N86-11502

**JOINTS (JUNCTIONS)**

The governing influence of the nose radius on the unsteady effects of large scale flow structure in the turbulent wing and plate junction flow
p 14 A86-11912

Adhesives for aerospace p 53 N86-11249

## K

**KALMAN FILTERS**

Finite wordlength design of digital Kalman filters for state estimation p 67 A86-10180

Comment on Determination of Aerodynamic Coefficients for a Reentry Body by Means of the Kalman Filter Method p 16 N86-10011

**KEVLAR (TRADEMARK)**

Fatigue of graphite/epoxy buffer strip panels with center cracks
[NASA-TM-87595] p 60 N86-10581

**KINETICS**

A dynamic analysis of the dimensional chains of aircraft control systems p 47 A86-12554

## L

**LABYRINTH SEALS**

A simple method for evaluating thermal stability of labyrinth seals p 57 A86-11621

**LAMINAR BOUNDARY LAYER**

The laminar-turbulent transition zone in the boundary layer p 55 A86-10822

**LAMINAR FLOW**

Comparison of predicted and measured drag for a single-engine airplane
[AIAA PAPER 85-4038] p 24 A86-10967

Computational wing design in support of an NLF variable sweep transition flight experiment --- Natural Laminar Flow
[AIAA PAPER 85-4074] p 7 A86-11039

**LAMINAR FLOW AIRFOILS**

JetStar smoothes the way p 30 A86-12008

**LAMINATES**

Surface protection of graphite fabric/PMR-15 composites subjected to thermal oxidation
p 53 N86-11281

**LANDING GEAR**

In-service landing gear actuation system problems - The solution
[AIAA PAPER 85-4019] p 23 A86-10954

Full-scale testing of the VNII NP-261 lubricant
p 53 A86-12607

**LANDING LOADS**

Aerodynamically landing reentry vehicles
p 50 A86-11768

**LANDING MODULES**

Aerodynamically landing reentry vehicles
p 50 A86-11769

**LAP JOINTS**

On flaw size and distribution in lap joints
p 57 A86-11755

The alternating surface segmented lap joint: A design for thin highly loaded joints p 60 N86-11233

**LARGE SPACE STRUCTURES**

Servo-elastic oscillations - Control of transient dynamic motion of a plate p 56 A86-11344

**LASER ANEMOMETERS**

Comparison of calculated and measured velocities near the tip of a model rotor blade at transonic speeds
[NASA-TM-86697] p 33 N86-11196

**LASER APPLICATIONS**

High-speed laser photorecording of a fuel nozzle jet
p 41 A86-12555

Laser angle sensor
[NASA-CR-172369] p 49 N86-11207

**LASER DOPPLER VELOCIMETERS**

Laser Doppler velocimeter measurements in a 3-D impinging twin-jet fountain flow
[AIAA PAPER 85-4036] p 6 A86-10965

An experimental study of the compressor rotor flow field at off-design condition using laser Doppler velocimeter
p 13 A86-11636

**LASERS**

Laser angle sensor
[NASA-CR-172369] p 49 N86-11207

**LATERAL CONTROL**

The concept of lateral blowing
[AIAA PAPER 85-5000] p 9 A86-11055

A method for the modal synthesis of an aircraft lateral motion control law p 47 A86-12557

**LAUNCH VEHICLES**

Heavy lift launch vehicles for 1995 and beyond
[NASA-TM-86520] p 51 N86-11216

**LAUNCHERS**

A novel launcher for R.P.V.s p 48 A86-10366

Launch and recovery of airborne remotely piloted vehicles p 48 A86-10367

**LAW (JURISPRUDENCE)**

The Brazilian aircraft industry and the use of law as a tool for development p 72 A86-10274

**LEADING EDGES**

Analysis of leading-edge vortices on complex configurations
[AIAA PAPER 85-4054] p 6 A86-11026

A unique applied computational method for vortex lift aerodynamics and vortex burst for arbitrary aircraft
[AIAA PAPER 85-4057] p 6 A86-11028

Leading edge flap planform effects for wings of moderate leading edge sweep
[AIAA PAPER 85-5005] p 10 A86-11060

Three articles on new calculation methods in aeronautics (selected articles)
[AD-A145745] p 3 N86-10007

Numerical solution of hypersonic flow near leading edge of a flat plate p 16 N86-10008

**LEAST SQUARES METHOD**

Algebraic polynomial approximation in the LSQ sense of a family of curves
[AIAA PAPER 85-6026] p 69 A86-11455

**LIFE (DURABILITY)**

Flight worthiness of fire resistant hydraulic systems: Volume 1
[AD-A157618] p 33 N86-11199

**LIFE CYCLE COSTS**

Logistics considerations for design engineers
[AIAA PAPER 85-3056] p 67 A86-10929

Flight worthiness of fire resistant hydraulic systems: Volume 1
[AD-A157618] p 33 N86-11199

**LIFT**

Correction of lift coefficient for tandem circular-cascade diffusers p 55 A86-10476

Maximum circulation lift coefficient developed on a low aspect ratio wing with a blown flap
[AIAA PAPER 85-3085] p 6 A86-10940

A unique applied computational method for vortex lift aerodynamics and vortex burst for arbitrary aircraft
[AIAA PAPER 85-4057] p 6 A86-11028

Lifting surface theory for a helicopter rotor in forward flight p 12 A86-11157

Airfoil dynamic stall performance with large-amplitude motions p 12 A86-11226

**LIFT AUGMENTATION**

Study of turbine bypass remote augmentor lift system for V/STOL aircraft
[AIAA PAPER 85-3086] p 36 A86-10941

Aerodynamic design considerations for efficient high-lift supersonic wings
[AIAA PAPER 85-4076] p 8 A86-11041

Transonic separated solutions for an augmentor-wing
[AIAA PAPER 85-5004] p 10 A86-11059

Aerodynamics of hyperlift systems
[SNIAS-443.501/85] p 18 N86-10023

Analysis of hyperlift systems. Study of a singularities method
[SNIAS-443.529/84] p 19 N86-10024

**LIFT DEVICES**

Aerodynamics of hyperlift systems
[SNIAS-443.501/85] p 18 N86-10023

Analysis of hyperlift systems. Study of a singularities method
[SNIAS-443.529/84] p 19 N86-10024

**LIFT DRAG RATIO**

Leading edge flap planform effects for wings of moderate leading edge sweep
[AIAA PAPER 85-5005] p 10 A86-11060

Investigations of modern general aviation propellers
p 44 N86-11162

**LIFTING BODIES**

Lifting surface theory for a helicopter rotor in forward flight p 12 A86-11157

Flutter analysis of a thin-walled lifting surface
p 58 A86-12528

Aerodynamics of wide-chord propellers in non-axisymmetric flow p 42 N86-11153

**LIGHT AIRCRAFT**

Agonies of the Lear Fan p 1 A86-10148

The operational 'Eyrie' multi-role advanced mini-RPV system p 21 A86-10354

Experimental RPV - An Indian experience
p 21 A86-10355

Now is the time for remotely piloted helicopters
p 1 A86-10359

Development status of the RSRA/X-Wing --- Rotor System Research Aircraft
[AIAA PAPER 85-4008] p 23 A86-10951

Small format microlight surveys p 65 A86-11789

**LIGHTNING**

Electromagnetic resonances of cylinders and aircraft model with resistive wires
[NASA-CR-176250] p 32 N86-10042

Simulated direct-strike lightning testing at Sandia National Laboratories
[DE85-012033] p 49 N86-10049

User's manual for AC-20-53A protection of airplane fuel systems against fuel vapor ignition due to lightning
[AD-A157619] p 20 N86-11191

**LINEAR SYSTEMS**

Stochastic dynamic system suboptimal control with uncertain parameters p 67 A86-10191

Structural identification of linear time-invariant dynamic systems under random inputs p 70 A86-11597

**LININGS**

The effect of acoustically lined walls on cascade flutter p 36 A86-10477

Burner liner thermal/structural load modelling
p 63 N86-11514

Component-specific modeling p 45 N86-11515

The 3-D inelastic analysis methods for hot section components (base program) p 63 N86-11517

**LOGISTICS**

Logistics considerations for design engineers
[AIAA PAPER 85-3056] p 67 A86-10929

Operational and support considerations in standardization --- military avionics
[AIAA PAPER 85-5063] p 56 A86-11416

**LOGISTICS MANAGEMENT**

Logistics supportability considerations during conceptual and preliminary design --- of aircraft
[AIAA PAPER 85-3052] p 2 A86-10928

**LONGERONS**

A comparison of measured and calculated thermal stresses in a hybrid metal matrix composite spar cap element
[NASA-TM-86729] p 64 N86-11525

**LONGITUDINAL CONTROL**

Laser angle sensor
[NASA-CR-172369] p 49 N86-11207

**LONGITUDINAL STABILITY**
Digital flight control of longitudinally unstable aircraft
[AIAA PAPER 85-3088] p 46 A86-10942

**LOW ALTITUDE**
A helicopter terrain following system for terminal area operations
[AIAA PAPER 85-3092] p 34 A86-10944

**LOW ASPECT RATIO WINGS**
Nonsymmetric solutions in the problem of flow past a plate with a pair of vortex-sink combinations
p 5 A86-10735
Maximum circulation lift coefficient developed on a low aspect ratio wing with a blown flap
[AIAA PAPER 85-3085] p 6 A86-10940

**LOW COST**
The status of a low cost gas turbine programme
p 35 A86-10362

**LOW VISIBILITY**
A study into the operability of RPVs in adverse weather p 20 A86-10352

**LUBRICANT TESTS**
Full-scale testing of the VNII NP-261 lubricant
p 53 A86-12607
Trials on the asperity counting monitoring system --- helicopter gearboxes
[RES-PAPER-670] p 50 N86-10550

**LUBRICATING OILS**
Deposits in aircraft engines. I - Type of deposits and test methods p 40 A86-11757

## M

**MACH NUMBER**
Subsonic/supersonic linear unsteady analysis
[AIAA PAPER 85-4059] p 7 A86-11030

**MACHINING**
The factory of the future p 60 N86-11228

**MAGNETOMETERS**
Magnetics and guidance systems p 33 A86-10369

**MALFUNCTIONS**
Evaluation of fault reporting/fault isolation for F-15 aircraft
[AD-A156516] p 33 N86-11197

**MAN POWERED AIRCRAFT**
Human-powered flight p 3 A86-12296

**MANNED SPACE FLIGHT**
Manned flight simulation: Challenge and response
[NASA-TM-86827] p 49 N36-10048

**MANUALS**
User manual for the Falcon system --- Falcon research aircraft
[DFVLR-MITT-85-08] p 65 N86-10721
Evaluation of fault reporting/fault isolation for F-15 aircraft
[AD-A156516] p 33 N86-11197

**MANUFACTURING**
The factory of the future p 60 N86-11228

**MARKET RESEARCH**
Turboprop airliners get bigger - Will they have a market? p 22 A86-10568

**MARKOV PROCESSES**
Fundamental aspects of the theory of continuous Markovian controllable systems and the application of this theory --- Russian book p 70 A86-11535

**MASS TRANSFER**
Scalar and momentum turbulent transport experiments with swirling and nonswirling flows p 58 A86-11938

**MATERIALS SCIENCE**
Approaches to development of composite materials for aviation industry in China p 52 A86-12313

**MATHEMATICAL MODELS**
Development and application of mathematical models of aircraft --- Russian book p 29 A86-11945
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A147304] p 3 N86-10001
A numerical solution of the shock-turbulent interaction over a compression corner for supersonic flow
p 16 N86-10003
Component-specific modeling p 45 N86-11515

**MATHEMATICAL PROGRAMMING**
Finite wordlength design of digital Kalman filters for state estimation p 67 A86-10180

**MATRIX MATERIALS**
Surface protection of graphite fabric/PMR-15 composites subjected to thermal oxidation
p 53 N86-11281

**MATRIX METHODS**
A comparison of measured and calculated thermal stresses in a hybrid metal matrix composite spar cap element
[NASA-TM-86729] p 64 N86-11525

**MECHANICAL PROPERTIES**
Current and future engine applications of Gr/PI composites p 54 N86-11291

**MEMORY (COMPUTERS)**
Multiprocessor application in flight management systems
[AIAA PAPER 85-5079] p 34 A86-11425

**METAL FATIGUE**
Acoustic emission studies for detection and monitoring incipient cracks in a simulated aero engine mount under fatigue p 59 A86-12562

**METAL MATRIX COMPOSITES**
A type of wire for composites p 52 A86-11734
Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**METAL PLATES**
Nondestructive control of thick structures made without disassembling
[PV-43-954/F/3] p 60 N86-10564

**METAL SHEETS**
The influence of thickness in predictions of lifetime and crack propagation in cases involving dynamically loaded aeronautical metal sheets p 57 A86-11774

**METAL-METAL BONDING**
Adhesives for aerospace p 53 N86-11249

**METALS**
Attachment method-ceramic radome to metal body
[AD-D011778] p 30 N86-10032

**METEOROLOGICAL FLIGHT**
Comparative flight measurement of icing parameters for the propeller aircraft Do-28D2 of the test station 61 of the DFVLR and for the DFVLR aircraft Falon 20e in stratus clouds
[DFVLR-FB-85-16] p 65 N86-10720
User manual for the Falcon system --- Falcon research aircraft
[DFVLR-MITT-85-08] p 65 N86-10721

**METEOROLOGICAL PARAMETERS**
Meteorological and Environmental Inputs to Aviation Systems
[NASA-CP-2388] p 66 N86-11735

**METEOROLOGICAL RADAR**
Overview of meteorological inputs to NASP
p 66 N86-11736

**METEOROLOGICAL SERVICES**
Meteorological and Environmental Inputs to Aviation Systems
[NASA-CP-2388] p 66 N86-11735
Overview of meteorological inputs to NASP
p 66 N86-11736
Airline meteorological requirements
p 66 N86-11737

**MICROPROCESSORS**
Is there a risc in the avionic computer future? --- Reduced Instruction Set Computers
[AIAA PAPER 85-5081] p 34 A86-11427

**MICROWAVE LANDING SYSTEMS**
Coming soon to a theater near you: The microwave landing system
[AD-A156468] p 20 N86-11190

**MILITARY AIRCRAFT**
A study into the operability of RPVs in adverse weather p 20 A86-10352
Unmanned aircraft for the Royal Air Force?
p 1 A86-10353
Area search rate and image interpreter performance --- for military RPV p 2 A86-10373
Technology for mini-RPV's p 2 A86-10375
Integrated flight/propulsion control - Methodology, design, and evaluation
[AIAA PAPER 85-3048] p 36 A86-10927
The automated interactive simulation modeling system
[AIAA PAPER 85-5055] p 68 A86-11411
Specification and review of flight critical digital systems
[AIAA PAPER 85-5097] p 46 A86-11437
Quasi-optimal on-line guidance laws for military aircraft
[AIAA PAPER 85-1977] p 47 A86-12294

**MILITARY HELICOPTERS**
Is the 580 rotor Bell's LHX candidate?
p 22 A86-10566
Simulation evaluation of display/FLIR concepts for low-altitude, terrain-following helicopter operations
[AIAA PAPER 85-3093] p 34 A86-10945
LHX program overview
[AIAA PAPER 85-4008] p 2 A86-10950
Mission-oriented requirements for updating MIL-H-8501: Calspan proposed structure and rationale
[NASA-CR-177371] p 48 N86-11204

**MILITARY TECHNOLOGY**
Portable tactical display systems for RPV's
p 48 A86-10376
Data link communications in tactical air command and control systems p 21 A86-11116
Operational and support considerations in standardization --- military avionics
[AIAA PAPER 85-5063] p 56 A86-11416

**MISSILES**
Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270

**MISSION PLANNING**
A comparative analysis of a CV helicopter and a JVX (Joint Services Advanced Vertical Lift) tilt-rotor aircraft in an aircraft carrier based ASW (Anti-Submarine Warfare)
[AD-A156871] p 31 N86-10041

**MIXING**
Evaluation of experimental epoxy monomers
p 51 A86-11397

**MODAL RESPONSE**
A method for the modal synthesis of an aircraft lateral motion control law p 47 A86-12557

**MODELS**
Laboratory model of flight through wind shear
p 67 N86-11747
A model of a downburst, a wind tunnel program on planetary boundary layer, and airship in turbulence
p 67 N86-11748

**MOLDING MATERIALS**
Fabrication process of a high temperature polymer matrix engine duct p 54 N86-11290

**MOMENTUM THEORY**
A review of dynamic inflow and its effect on experimental correlations p 27 A86-11163

**MOMENTUM TRANSFER**
Scalar and momentum turbulent transport experiments with swirling and nonswirling flows p 58 A86-11938

**MONITORS**
Expert systems development and application
[NASA-TM-86746] p 32 N86-11194

**MONOMERS**
Evaluation of experimental epoxy monomers
p 51 A86-11397

**MOTION STABILITY**
The problem of selecting the parameters of a flight vehicle on the basis of the motion stability requirement
p 47 A86-12540

**MRCA AIRCRAFT**
The operational 'Eyrie' multi-role advanced mini-RPV system p 21 A86-10354
Multi-mission RPV system experiences
p 1 A86-10356
Post-2000 - The multimode aircraft system
[AIAA PAPER 85-4015] p 2 A86-10952

**MULTIPHASE FLOW**
Three-dimensional flow effects in a two-dimensional air intake with mixed supersonic compression
p 13 A86-11612
Numerical modeling of afterburner combustion
p 38 A86-11641

**MULTIPROCESSING (COMPUTERS)**
Matched processors for quantized control - A practical parallel-processing approach p 68 A86-11123
Multiprocessor application in flight management systems
[AIAA PAPER 85-5079] p 34 A86-11425
Architectural concepts for integrated realtime multiprocessors
[AIAA PAPER 85-5053] p 69 A86-11464

## N

**NACELLES**
Flow simulations for detailed nacelle-exhaust flow using Euler equations
[AIAA PAPER 85-5003] p 10 A86-11058
Wind tunnel investigation of the interaction of propeller slipstream with nacelle/wing/flap combinations
p 44 N86-11166
Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270
Environmental stability graphite/PMR-15 composites
p 53 N86-11284
Application of Gr/PMR-15 to commercial aircraft
p 54 N86-11289

**NASA PROGRAMS**
High angle of attack maneuvering probed
p 29 A86-11959
JetStar smoothes the way p 30 A86-12008
Overview of NASA's programs p 66 N86-11741
NASA-universities relationships in aero/space engineering: A review of NASA's program
[NASA-CR-176307] p 73 N86-12158

**NASTRAN**
Planning, creating and documenting a NASTRAN finite element model of a modern-helicopter
p 28 A86-11170

**NAVIER-STOKES EQUATION**
Comparison of transonic airfoil characteristics by Navier-Stokes computation and by wind tunnel test at high Reynolds number
[AIAA PAPER 85-5025] p 11 A86-11071

Three-dimensional calculation of transonic viscous flows by an implicit method p 12 A86-11230
Numerical solution of hypersonic flow near leading edge of a flat plate p 16 N86-10008
Numerical procedure for three-dimensional hypersonic viscous flow over aerobrake configuration
[NASA-TM-58269] p 18 N86-10018

**NAVIGATION AIDS**
Magnetics and guidance systems p 33 A86-10369

**NAVIGATION INSTRUMENTS**
Methodology of the flight testing of the flight-control and navigation equipment of aircraft and helicopters --- Russian book p 21 A86-12046

**NEAR FIELDS**
An investigation of in-flight near-field propeller noise generation and transmission p 71 N86-11171
Full-scale flight and model-scale wind tunnel tests on the nearfield noise characteristics of aircraft propellers p 71 N86-11172

**NETWORK ANALYSIS**
Predicate/transition network analysis of redundant channel synchronization
[AIAA PAPER 85-6020] p 69 A86-11450

**NOISE PREDICTION**
Theoretical analysis of linearized acoustics and aerodynamics of advanced supersonic propellers p 43 N86-11156

**NOISE PREDICTION (AIRCRAFT)**
Noise from a circulation control wing with upper surface blowing
[AIAA PAPER 85-3083] p 5 A86-10939
Helicopter noise p 71 A86-12025
Summary of work on jet noise prediction
[ESDU-BR-62636] p 71 N86-10679
Aeroacoustic wind tunnel measurements on propeller noise p 71 N86-11169
Full-scale flight and model-scale wind tunnel tests on the nearfield noise characteristics of aircraft propellers p 71 N86-11172
The state of the art in propfan turboprop noise p 72 N86-11175
Application of active noise control to model propeller noise p 72 N86-11176
Shock fitting applied to the prediction of high-speed rotor noise
[NASA-TM-86781] p 20 N86-11188
A numerical method of calculating propeller noise including acoustic nonlinear effects p 72 N86-12011

**NOISE PROPAGATION**
A unified approach for the aerodynamics and acoustics of propellers in forward motion p 42 N86-11155
Shock fitting applied to the prediction of high-speed rotor noise
[NASA-TM-86781] p 20 N86-11188

**NOISE SPECTRA**
Some aeroacoustic wind tunnel measurements, theoretical predictions, and flight-test correlations on subsonic aircraft propellers p 45 N86-11170

**NOISE TOLERANCE**
The effect of changes in aircraft noise exposure p 65 A86-12447

**NONDESTRUCTIVE TESTS**
Nondestructive control of thick structures made without disassembling
[PV-43-954/F/3] p 60 N86-10564
Nondestructive corrosion test of aluminum alloy structures
[PV-43-954/F/2] p 60 N86-10594

**NONFLAMMABLE MATERIALS**
Flight worthiness of fire resistant hydraulic systems: Volume 1
[AD-A157618] p 33 N86-11199

**NONLINEAR SYSTEMS**
Performance analysis of a fault inferring nonlinear detection system algorithm with integrated avionics flight data
[AIAA PAPER 85-6022] p 69 A86-11452
Control concepts for in-flight simulation including actuator nonlinearities and time delays
[DFVLR-FB-85-24] p 48 N86-10047

**NONLINEARITY**
A study of the aerodynamic performance of Weis-Fogh wings p 17 N86-10012

**NOSE WHEELS**
A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear
[NASA-TP-2481] p 64 N86-11522

**NOSES (FOREBODIES)**
The governing influence of the nose radius on the unsteady effects of large scale flow structure in the turbulent wing and plate junction flow p 14 A86-11912

**NOZZLE DESIGN**
Study on design of a supersonic nozzle. I - Improvement of a calculating method for a flowfield of mixed type p 5 A86-10480
A coupled inverse-inverse method for over-expanded supersonic nozzles
[ONERA, TP NO. 1985-109] p 12 A86-11605
Operating characteristics of the multiple critical Venturi System and secondary calibration nozzles used for weight-flow measurements in the Langley 16-foot transonic tunnel
[NASA-TM-86405] p 17 N86-10016

**NOZZLE EFFICIENCY**
Unsteady operation of the fuel nozzles of the main combustion chamber of a gas-turbine engine p 41 A86-12549

**NOZZLE FLOW**
Supersonic wind tunnel simulation of propulsive jets p 4 A86-10021
Study on design of a supersonic nozzle. I - Improvement of a calculating method for a flowfield of mixed type p 5 A86-10480
High-speed laser photorecording of a fuel nozzle jet p 41 A86-12555
Theoretical specific impulse for two-phase flow in nozzle of rocket-ramjet engine: A simple estimation method p 51 N86-10005
Operating characteristics of the multiple critical Venturi System and secondary calibration nozzles used for weight-flow measurements in the Langley 16-foot transonic tunnel
[NASA-TM-86405] p 17 N86-10016

**NOZZLE THRUST COEFFICIENTS**
The effect of the initial temperature nonuniformity and excess air ratio of the afterburner of a gas-turbine engine on the specific pulse of the nozzle p 40 A86-12531

**NUCLEAR EXPLOSION EFFECT**
An overview of EMP effects and their control p 58 A86-12074

**NUMERICAL ANALYSIS**
Numerical procedure for three-dimensional hypersonic viscous flow over aerobrake configuration
[NASA-TM-58269] p 18 N86-10018
Application of the vortex-lattice concept to flows with smooth-surface separation
[AD-A157571] p 61 N86-11430

**NUMERICAL CONTROL**
Traffic Alert and Collision Avoidance System Signal Environment Model (TCAS SEM) programmer's reference manual
[FAA-PM-85-22] p 21 N86-11192
Computational structural mechanics: A new activity at the NASA Langley Research Center
[NASA-TM-87612] p 65 N86-11540

**NUMERICAL FLOW VISUALIZATION**
The generation of noise in impinging vortex motion past a step p 70 A86-10177
Flow simulations for detailed nacelle-exhaust flow using Euler equations
[AIAA PAPER 85-5003] p 10 A86-11058

**O**

**OBLIQUE WINGS**
Oblique wing - New approach to an old problem p 29 A86-11960

**OGIVES**
Effect of the Reynolds number on the aerodynamic characteristics of an ogive-cylinder at high angle of attack p 14 A86-12022

**ONBOARD DATA PROCESSING**
Quasi-optimal on-line guidance laws for military aircraft
[AIAA PAPER 85-1977] p 47 A86-12294

**OPERATING COSTS**
General aviation cost effectiveness
[AIAA PAPER 85-4029] p 73 A86-10959
F-16X MSIP (Multi-national Staged Improvement Program) case example: Operating and support cost estimation using VAMOSC (Visibility And Management Of Operating and Support Costs)
[AD-A156693] p 3 N86-10006

**OPERATING TEMPERATURE**
Turbine Engine Hot Section Technology (HOST)
[NASA-CP-2289] p 61 N86-11495
Turbine engine Hot Section Technology (HOST) project p 61 N86-11496
Turbine heat transfer p 62 N86-11505
Gas side heat transfer p 62 N86-11507

**OPTIMAL CONTROL**
Stochastic dynamic system suboptimal control with uncertain parameters p 67 A86-10191
Matched processors for quantized control - A practical parallel-processing approach p 68 A86-11123

**OPTIMIZATION**
Logistics considerations for design engineers
[AIAA PAPER 85-3056] p 67 A86-10929
Teaching and learning conceptual design in the CAD era Generating problems and integrating solutions
[AIAA PAPER 85-3081] p 73 A86-10937
Optimization of three-dimensional computational grids
[AIAA PAPER 85-4087] p 8 A86-11048
The use of numerical optimization for airfoil design
[AIAA PAPER 85-5026] p 11 A86-11072
Optical design application on the advanced aeroelastic rotor blade p 26 A86-11160
Structural optimization by multilevel decomposition p 56 A86-11245
Optimization of airplane wing structures under gust loads p 29 A86-11883
Optimum wing - For all flight conditions? p 29 A86-11961
The problem of determining the optimum parameters of an autopilot p 47 A86-12539
Optimum design of an aircraft wing structure with multiple constraints by the direct-vision criteria method p 30 N86-10004

**OSCILLATING FLOW**
Effect of hinge gap on aerodynamics of thin airfoils having an oscillating flap p 5 A86-10517
Experimental study of vortex breakdown on a delta wing in incompressible flow
[ONERA, TP NO. 1985-107] p 15 A86-12283

**OUTLET FLOW**
Prediction of outlet flow characteristics of centrifugal impellers. I - Consideration of velocity distortion p 55 A86-10481

**OUTPUT**
KRASH85 user's guide: Input/output format
[FAA-CT-85-10] p 70 N86-11898

**P**

**PANEL METHOD (FLUID DYNAMICS)**
Subsonic/supersonic linear unsteady analysis
[AIAA PAPER 85-4059] p 7 A86-11030
Comparison of results from a panel method and an Euler code for a cranked delta wing
[AIAA PAPER 85-4091] p 9 A86-11051
Evaluation of four panel aerodynamic prediction methods (MCAERO, PAN AIR, QUADPAN, and VSAERO)
[AIAA PAPER 85-4092] p 9 A86-11052
Design concept and performance prediction technique for potential flows around advanced propellers p 42 N86-11150

**PANELS**
Fatigue of graphite/epoxy buffer strip panels with center cracks
[NASA-TM-87595] p 60 N86-10581

**PARALLEL PROCESSING (COMPUTERS)**
Matched processors for quantized control - A practical parallel-processing approach p 68 A86-11123

**PARAMETER IDENTIFICATION**
The problem of determining the optimum parameters of an autopilot p 47 A86-12539
The problem of selecting the parameters of a flight vehicle on the basis of the motion stability requirement p 47 A86-12540
Comment on Determination of Aerodynamic Coefficients for a Reentry Body by Means of the Kalman Filter Method p 16 N86-10011
System modeling and identification of equivalent systems with and without compensating time delay for control-augmented aircraft
[ESA-TT-852] p 32 N86-10043

**PARAMETERIZATION**
Theoretical specific impulse for two-phase flow in nozzle of rocket-ramjet engine: A simple estimation method p 51 N86-10005

**PASSENGER AIRCRAFT**
Agonies of the Lear Fan p 1 A86-10146
Turboprop airliners get bigger - Will they have a market? p 22 A86-10568
JT9D engine/module performance deterioration results from back to back testing p 39 A86-11663

**PATTERN RECOGNITION**
In-flight monitoring for incipient cracks in an aero engine mount - An approach through pattern recognition p 35 A86-12574

**PAVEMENTS**
Validation of procedures for pavement design on expansive soils
[FAA-PM-85-15] p 61 N86-11362

**PERFORATED PLATES**
Aerodynamic resistance of perforated plates in natural convection p 58 A86-12272

**PERFORMANCE PREDICTION**
Procedures for trending aircraft gas turbine engine performance p 39 A86-11662
A comparative analysis of a CV helicopter and a JVX (Joint Services Advanced Vertical Lift) tilt-rotor aircraft in an aircraft carrier based ASW (Anti-Submarine Warfare)
[AD-A156871] p 31 N86-10041

Design concept and performance prediction technique for potential flows around advanced propellers p 42 N86-11150
A review of ARA research into propeller aerodynamic prediction methods p 42 N86-11151
**PERFORMANCE TESTS**
Deposits in aircraft engines. I - Type of deposits and test methods p 40 A86-11757
Performance evaluation of full scale propellers by wind tunnel test p 43 N86-11160
A comparison of the NAVTOLAND (Navy vertical takeoff and landing) SH-2F helicopter model with the requirements of MIL-H-8501A and with flight data
[AD-A157297] p 33 N86-11198
**PERTURBATION**
Comparison of uniform perturbation and numerical solutions for some potential flows past slender bodies p 4 A86-10268
**PETRI NETS**
Predicate/transition network analysis of redundant channel synchronization
[AIAA PAPER 85-6020] p 69 A86-11450
**PHENOLIC EPOXY RESINS**
Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270
**PHOTOGRAMMETRY**
Small format microlight surveys p 65 A86-11789
**PILOT TRAINING**
Proposed modifications for the RAAF Airtrainer CT-4A cockpit
[AD-A156808] p 31 N86-10039
Recognition and control of low level wind shear
[AD-A156500] p 67 N86-11758
**PILOTLESS AIRCRAFT**
Remotely piloted vehicles; International Conference, 4th, Bristol, England, April 9-11, 1984, Proceedings and Supplementary Papers p 1 A86-10351
Unmanned aircraft for the Royal Air Force? p 1 A86-10353
Digital flight control systems for UMA --- unmanned aircraft p 46 A86-10371
**PIPES (TUBES)**
HOST liner cyclic facilities p 63 N86-11519
**PISTON ENGINES**
The history and foreseeable developments in reciprocating engines for aircraft p 3 A86-11647
**PITCH (INCLINATION)**
Theoretical study of the unsteady linear problem for a rectangular wing with a pitching movement
[ONERA-RT-17/1841-RY-010-R] p 18 N86-10022
**PLANNING**
F-16X MSIP (Multi-national Staged Improvement Program) case example: Operating and support cost estimation using VAMOSC (Visibility And Management Of Operating and Support Costs)
[AD-A156893] p 3 N86-10006
Generation of flight paths using hierarchical planning
[AD-A156905] p 70 N86-10900
**PLASTIC AIRCRAFT STRUCTURES**
New world for aerospace composites p 51 A86-10145
Filament winding - Waking the sleeping giant p 54 A86-10146
**PLASTIC PROPERTIES**
The 3D inelastic analysis methods for hot section components p 63 N86-11516
**PLUMES**
Supersonic wind tunnel simulation of propulsive jets p 4 A86-10021
Jet plume temperature effects on afterbody pressure distribution and drag p 13 A86-11606
Initial dispersion of jet engine exhaust plume p 39 A86-11666
**PNEUMATIC CONTROL**
Dynamic response characteristics of a circulation control rotor model pneumatic system p 28 A86-11168
**POLAR ORBITS**
Heavy lift launch vehicles for 1995 and beyond
[NASA-TM-86520] p 51 N86-11216
**POLLUTION MONITORING**
Initial dispersion of jet engine exhaust plume p 39 A86-11666
**POLYIMIDE RESINS**
Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270
**POLYNOMIALS**
Algebraic polynomial approximation in the LSQ sense of a family of curves
[AIAA PAPER 85-6026] p 69 A86-11455
**POROUS MATERIALS**
Numerical simulation of transonic flow over porous airfoils
[AIAA PAPER 85-5022] p 11 A86-11070
**POROUS PLATES**
A study of the swirling of a liquid by porous rotors --- in aircraft engine centrifugal pumps p 40 A86-12532
**PORTABLE EQUIPMENT**
A novel launcher for R.P.V.s p 48 A86-10366
The Vega portable radar tracking control system p 20 A86-10368
Portable tactical display systems for RPV's p 48 A86-10376
**POTENTIAL FLOW**
Comparison of uniform perturbation and numerical solutions for some potential flows past slender bodies p 4 A86-10268
Shock fitting in conical supersonic full potential flows p 4 A86-10270
Entropy corrections to supersonic conical nonlinear potential flows p 4 A86-10271
Unsteady full potential calculations for complex wing-body configurations
[AIAA PAPER 85-4062] p 7 A86-11032
Second-order-accurate spatial differencing for the transonic small-disturbance equation p 12 A86-11233
Application of the vortex-lattice concept to flows with smooth-surface separation
[AD-A157571] p 61 N86-11430
**POWERED LIFT AIRCRAFT**
Design and development of a power takeoff (PTO) shaft for the X-29 Forward Swept Wing (FSW) demonstrator aircraft
[AIAA PAPER 85-4045A] p 36 A86-10971
**PREDICTION ANALYSIS TECHNIQUES**
Evaluation of four panel aerodynamic prediction methods (MCAERO, PAN AIR, QUADPAN, and VSAERO)
[AIAA PAPER 85-4092] p 9 A86-11052
Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration
[NASA-TM-86782] p 17 N86-10015
Inlet flow dynamic distortion prediction without rms measurements p 19 N86-11183
Validation of procedures for pavement design on expansive soils
[FAA-PM-85-15] p 61 N86-11362
**PREDICTIONS**
Manned flight simulation: Challenge and response
[NASA-TM-86827] p 49 N86-10048
Gas side heat transfer p 62 N86-11507
Life prediction and constitutive behavior p 64 N86-11520
Creep fatigue life prediction for engine hot section materials (isotropic) p 64 N86-11521
**PRESSURE DISTRIBUTION**
An investigation of gridding on the accuracy of FLO57MM and FLO57MG Euler wing solutions
[AIAA PAPER 85-4090] p 9 A86-11050
Experimental and theoretical investigations of the flow around airfoil systems with ground effect
[DFVLR-FB-85-17] p 19 N86-10026
**PRESSURE DRAG**
Jet plume temperature effects on afterbody pressure distribution and drag p 13 A86-11606
**PRESSURE DROP**
Effect of a shear layer on the stability of an axisymmetrical external compression air intake p 16 N86-10010
**PRESSURE GRADIENTS**
A mathematically simple turbulence closure model for attached and separated turbulent boundary layers p 55 A86-11232
**PRESSURE OSCILLATIONS**
A numerical method of calculating propeller noise including acoustic nonlinear effects p 72 N86-12011
**PRESSURE RECOVERY**
Subsonic diffuser design and performance for advanced fighter aircraft
[AIAA PAPER 85-3073] p 5 A86-10934
**PROCESS CONTROL (INDUSTRY)**
Adhesives for aerospace p 53 N86-11249
**PRODUCT DEVELOPMENT**
Logistics supportability considerations during conceptual and preliminary design --- of aircraft
[AIAA PAPER 85-3052] p 2 A86-10928
**PRODUCTION ENGINEERING**
Adhesives for aerospace p 53 N86-11249
**PROFILES**
Optimisation of recess-action conformal profiles for aero gas-turbine engine gears - A computer based analytical approach p 57 A86-11617
**PROP-FAN TECHNOLOGY**
Propfans gear up p 35 A86-10143
Propeller power p 40 A86-12365
**PROPELLER BLADES**
Design concept and performance prediction technique for potential flows around advanced propellers p 42 N86-11150
A review of ARA research into propeller aerodynamic prediction methods p 42 N86-11151
Aerodynamics of wide-chord propellers in non-axisymmetric flow p 42 N86-11153
Dynamic behavior of a propfan p 43 N86-11159
Investigations of modern general aviation propellers p 44 N86-11162
Aeroacoustic wind tunnel measurements on propeller noise p 71 N86-11169
Some aeroacoustic wind tunnel measurements, theoretical predictions, and flight-test correlations on subsonic aircraft propellers p 45 N86-11170
An investigation of in-flight near-field propeller noise generation and transmission p 71 N86-11171
**PROPELLER DRIVE**
Propeller power p 40 A86-12365
Aerodynamic and structural aspects of propeller and drive for a 1/5 scale wind tunnel programme p 44 N86-11163
Some considerations in propeller and airframe integration p 44 N86-11164
**PROPELLER EFFICIENCY**
Aerodynamics of wide-chord propellers in non-axisymmetric flow p 42 N86-11153
On the aerodynamics of installed propellers p 42 N86-11154
A unified approach for the aerodynamics and acoustics of propellers in forward motion p 42 N86-11155
Theoretical analysis of linearized acoustics and aerodynamics of advanced supersonic propellers p 43 N86-11156
Performance evaluation of full scale propellers by wind tunnel test p 43 N86-11160
Aerodynamic and structural aspects of propeller and drive for a 1/5 scale wind tunnel programme p 44 N86-11163
Some considerations in propeller and airframe integration p 44 N86-11164
Wind tunnel investigation of the interaction of propeller slipstream with nacelle/wing/flap combinations p 44 N86-11166
Development of modern turboprop engines p 45 N86-11168
**PROPELLER SLIPSTREAMS**
On the aerodynamics of installed propellers p 42 N86-11154
A unified approach for the aerodynamics and acoustics of propellers in forward motion p 42 N86-11155
**PROPELLERS**
Aerodynamics and Acoustics of Propellers
[AGARD-CP-366] p 3 N86-11147
Aerodynamic method used in France for advanced fast propeller study p 42 N86-11149
A review of ARA research into propeller aerodynamic prediction methods p 42 N86-11151
Modern propeller profiles p 42 N86-11152
Summary of recent NASA propeller research p 43 N86-11158
Performance evaluation of full scale propellers by wind tunnel test p 43 N86-11160
Study of the 3D wake of an aerial propeller p 43 N86-11161
Investigations of modern general aviation propellers p 44 N86-11162
Aerodynamic and structural aspects of propeller and drive for a 1/5 scale wind tunnel programme p 44 N86-11163
Problems of the integration of propellers in airframes, especially for high performance twin-engine aircraft p 44 N86-11165
Wind tunnel investigation of the interaction of propeller slipstream with nacelle/wing/flap combinations p 44 N86-11166
An asymptotic theory for the interference of large aspect ratio swept wings and multiple propeller slipstreams p 44 N86-11167
Aeroacoustic wind tunnel measurements on propeller noise p 71 N86-11169
Some aeroacoustic wind tunnel measurements, theoretical predictions, and flight-test correlations on subsonic aircraft propellers p 45 N86-11170
An investigation of in-flight near-field propeller noise generation and transmission p 71 N86-11171
Full-scale flight and model-scale wind tunnel tests on the nearfield noise characteristics of aircraft propellers p 71 N86-11172
Application of active noise control to model propeller noise p 72 N86-11176
A numerical method of calculating propeller noise including acoustic nonlinear effects p 72 N86-12011
**PROPULSION**
Future directions in aeropropulsion technology p 2 A86-11602
**PROPULSION SYSTEM CONFIGURATIONS**
Maximum circulation lift coefficient developed on a low aspect ratio wing with a blown flap
[AIAA PAPER 85-3065] p 6 A86-10940
A parametric evaluation of supersonic STOVL
[SAE PAPER 851170] p 25 A86-10974
Propeller power p 40 A86-12365

**PROPULSION SYSTEM PERFORMANCE**
Propfans gear up p 35 A86-10143
Aircraft turbofans - New economic and environmental benefits p 36 A86-10500
A study on performances of variable geometry turbofan engines utilizing an approximated analytical method p 38 A86-11648

**PROTECTION**
User's manual for AC-20-53A protection of airplane fuel systems against fuel vapor ignition due to lightning
[AD-A157619] p 20 N86-11191

**PROTECTIVE COA[illegible]GS**
Turbine Engine H[illegible]ection Technology (HOST)
[NASA-CP-2289] p 61 N86-11495

**PULSE COMMUNICATION**
Data link communications in tactical air command and control systems p 21 A86-11116

**PYLONS**
Stress analyses of B-52 pylon hooks
[NASA-TM-84924] p 64 N86-11524

**R**

**RADAR TRACKING**
The Vega portable radar tracking control system p 20 A86-10368

**RADIAL FLOW**
Three-dimensional inviscid analysis of radial turbine flow and a limited comparison with experimental data
[NASA-TM-87091] p 17 N86-10017

**RADIATION HARDENING**
Radiation hardened CMOS technology for flight systems
[AIAA PAPER 85-6040] p 56 A86-11460

**RADII**
The governing influence of the nose radius on the unsteady effects of large scale flow structure in the turbulent wing and plate junction flow p 14 A86-11912

**RADIO CONTROL**
Construction and use of a radio controlled model helicopter for research
[AD-A156547] p 31 N86-10035

**RADIO FREQUENCY INTERFERENCE**
Chemical bonding agent for suppression of rusty bolt intermodulation interference
[AD-D011747] p 54 N86-11315

**RADOMES**
Attachment method-ceramic radome to metal body
[AD-D011778] p 30 N86-10032

**RAMJET ENGINES**
Numerical simulation of self-excited oscillations in a ramjet inlet-diffuser flow p 13 A86-11615
Ramjet research in France - Realities and perspectives
[ONERA, TP NO. 1985-108] p 38 A86-11624
Theoretical specific impulse for two-phase flow in nozzle of rocket-ramjet engine: A simple estimation method p 51 N86-10005

**RANDOM PROCESSES**
Structural identification of linear time-invariant dynamic systems under random inputs p 70 A86-11597

**RANKINE-HUGONIOT RELATION**
Entropy corrections to supersonic conical nonlinear potential flows p 4 A86-10271

**RAREFIED GAS DYNAMICS**
Theory of local interaction in a rarefied gas - Variant of the method of tangent cones p 5 A86-10658

**REAL TIME OPERATION**
Modeling vehicle dynamics for flying qualities studies
[AIAA PAPER 85-3062] p 46 A86-10931
Architectural concepts for integrated realtime multiprocessors
[AIAA PAPER 85-5053] p 69 A86-11464
Real-time engine testing in the Aeropropulsion Systems Test Facility p 38 A86-11646

**RECONNAISSANCE AIRCRAFT**
Problems of the integration of propellers in airframes, especially for high performance twin-engine aircraft p 44 N86-11165

**RECOVERY**
Launch and recovery of airborne remotely piloted vehicles p 48 A86-10367

**RECTANGULAR PLANFORMS**
Characteristics of the flow around rectangular cylinders - The case of the angle of attack 0 deg p 15 A86-12271

**RECTANGULAR WINGS**
Influence of tip blowing on rectangular wings
[AIAA PAPER 85-5001] p 9 A86-11056
Experimental and theoretical investigations of the flow around airfoil systems with ground effect
[DFVLR-FB-85-17] p 19 N86-10026

**REENTRY VEHICLES**
Aerodynamically landing reentry vehicles p 50 A86-11768
Aerodynamically landing reentry vehicles p 50 A86-11769
Three articles on new calculation methods in aeronautics (selected articles)
[AD-A145745] p 3 N86-10007

**RELIABILITY ANALYSIS**
WIT - Test system for the MD-80s --- Wire Integrity Test for avionics of commercial aircraft
[AIAA PAPER 85-5082] p 34 A86-11428
Acoustic emission studies for detection and monitoring incipient cracks in a simulated aero engine mount under fatigue p 59 A86-12562
Aircraft structure surveillance in-flight using acoustic emission p 35 A86-12572
Acoustic emission monitoring of aircraft structures p 59 A86-12575

**RELIABILITY ENGINEERING**
Assuring the reliability of aircraft engines p 41 A86-12599
Reliability of wide-body aircraft p 59 A86-12600

**REMOTE CONTROL**
Construction and use of a radio controlled model helicopter for research
[AD-A156547] p 31 N86-10035

**REMOTE REGIONS**
The dirigible: A catalyst for resource exploitation in remote areas?

B-1B - Born again bomber p 30 A86-12009

**REYNOLDS NUMBER**
Effect of the Reynolds number on the aerodynamic characteristics of an ogive-cylinder at high angle of attack p 14 A86-12022

**ROLLING MOMENTS**
The concept of lateral blowing
[AIAA PAPER 85-5000] p 9 A86-11055

**ROTARY WING AIRCRAFT**
Mission-oriented requirements for updating MIL-H-8501: Calspan proposed structure and rationale
[NASA-CR-177371] p 48 N86-11204

**ROTARY WINGS**
Is the 680 rotor Bell's LHX candidate? p 22 A86-10566
Lifting surface theory for a helicopter rotor in forward flight p 12 A86-11157
Restructuring the rotor analysis program C-60 p 27 A86-11162
Evaluation of a load cell model for dynamic calibration of the Rotor Systems Research Aircraft p 49 A86-11174
A vortex point method for calculating inviscid incompressible flows around rotary wings p 14 A86-12021
Dynamic stall modeling of the NACA 0012 profile p 14 A86-12024
Theoretical study of the unsteady linear problem for a rectangular wing with a pitching movement
[ONERA-RT-17/1841-RY-010-R] p 18 N86-10022
Comparison of calculated and measured velocities near the tip of a model rotor blade at transonic speeds
[NASA-TM-86697] p 33 N86-11196
Aeroelastic model helicopter rotor testing in the Langley TDT
[NASA-TM-86440] p 64 N86-11523

**ROTATION**
Coolant passage heat transfer with rotation. A progress report on the computational aspects p 63 N86-11510

**ROTOR AERODYNAMICS**
Test results from a dynamic model Dynaflux rotor p 26 A86-11155
Lifting surface theory for a helicopter rotor in forward flight p 12 A86-11157

Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 26 A86-11158

Development and application of a time-history analysis for rotorcraft dynamics based on a component approach p 26 A86-11161

A review of dynamic inflow and its effect on experimental correlations p 27 A86-11163

The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 27 A86-11165

Dynamic response characteristics of a circulation control rotor model pneumatic system p 28 A86-11168

An experimental study of the compressor rotor flow field at off-design condition using laser Doppler velocimeter p 13 A86-11636

Dynamic stall modeling of the NACA 0012 profile p 14 A86-12024

Unsteady aerodynamic characteristics of a blade in pitching oscillations with flow separation. I - The case with laminar separation bubble. II - The case with leading edge stall. III - The case near the stalling angle of attack p 15 A86-12263

The performance characteristic of an air-separator of an axial flow fan p 15 A86-12267

A measurement method to evaluate fluid force on blades p 58 A86-12276

Propeller power p 40 A86-12365

A study of the swirling of a liquid by porous rotors — in aircraft engine centrifugal pumps p 40 A86-12532

Aeroelastic model helicopter rotor testing in the Langley TDT [NASA-TM-86440] p 64 N86-11523

**ROTOR BLADES**

Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover p 26 A86-11156

Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 26 A86-11158

Aeroelastic considerations for torsionally soft rotors p 26 A86-11159

Optical design application on the advanced aeroelastic rotor blade p 26 A86-11160

Flap-lag-torsion stability in forward flight p 27 A86-11166

Dynamic stability of a bearingless circulation control rotor blade in hover p 27 A86-11167

An examination of the relations between rotor vibratory loads and airframe vibrations p 28 A86-11169

A study of the effect of rotor blading parameters on the region of acceptable design solutions for the attachment of aircraft compressor blades p 41 A86-12544

**ROTOR BLADES (TURBOMACHINERY)**

Diagnosis and cure for a fatigue problem in the turbine rotor of a small turbo-engine p 38 A86-11623

Forced response analysis of an aerodynamically detuned supersonic turbomachine rotor [NASA-TM-87093] p 18 N86-10019

Shock fitting applied to the prediction of high-speed rotor noise [NASA-TM-86781] p 20 N86-11188

**ROTOR BODY INTERACTIONS**

Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings p 25 A86-11151

Ground resonance analysis using a substructure modeling approach p 25 A86-11152

An examination of the relations between rotor vibratory loads and airframe vibrations p 28 A86-11169

Coupled rotor-body vibrations with inplane degrees of freedom p 28 A86-11171

**ROTOR SPEED**

Shock fitting applied to the prediction of high-speed rotor noise [NASA-TM-86781] p 20 N86-11188

**ROTOR SYSTEMS RESEARCH AIRCRAFT**

Development status of the RSRA/X-Wing — Rotor System Research Aircraft [AIAA PAPER 85-4008] p 23 A86-10951

**ROTORS**

Three-dimensional inviscid analysis of radial turbine flow and a limited comparison with experimental data [NASA-TM-87091] p 17 N86-10017

Ground effect on a rotor wake [COLL-AERONAUTICS-8510] p 19 N86-11187

**RUBY LASERS**

High-speed laser photorecording of a fuel nozzle jet p 41 A86-12555

**RUNWAY CONDITIONS**

Enhancing aircraft rough airfield capabilities [AIAA PAPER 85-4018] p 23 A86-10953

Runway and maneuvering performance enhanced p 29 A86-11958

**S**

**SANDWICH STRUCTURES**

Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**SCALE MODELS**

Approach and landing thrust reverser testing in ground effect [AIAA PAPER 85-3075] p 23 A86-10935

**SCHEDULES**

Cost and schedule implications of multinational coproduction — of weapon systems [SAE PAPER 851150] p 73 A86-10972

**SEALING**

An adhesively sealed, composite skinned wing fuel tank [AIAA PAPER 85-4023] p 23 A86-10956

**SEARCHING**

A helicopter terrain following system for terminal area operations [AIAA PAPER 85-3092] p 34 A86-10944

**SECONDARY FLOW**

Structure and decay of secondary flow in the downstream of a cascade p 15 A86-12265

**SEISMIC WAVES**

Understanding and improving acoustic to seismic coupling as it pertains to Sandia's helicopter detector [DE85-009440] p 71 N86-10920

**SELF OSCILLATION**

Numerical simulation of self-excited oscillations in a ramjet inlet-diffuser flow p 13 A86-11615

**SENSORS**

Laser angle sensor [NASA-CR-172369] p 49 N86-11207

**SEPARATED FLOW**

Nonsymmetric solutions in the problem of flow past a plate with a pair of vortex-sink combinations p 5 A86-10735

Subsonic diffuser design and performance for advanced fighter aircraft [AIAA PAPER 85-3073] p 5 A86-10934

Analysis of leading-edge vortices on complex configurations [AIAA PAPER 85-4054] p 6 A86-11026

Transonic separated solutions for an augmentor-wing [AIAA PAPER 85-5004] p 10 A86-11059

Symmetric separated flow past slender bodies at angles of attack in subsonic and supersonic flows [AIAA PAPER 85-5007] p 10 A86-11062

The separated and non-separated airfoil wake behavior in the presence of free stream turbulence [AIAA PAPER 85-5027] p 11 A86-11073

A coupled inverse-inverse method for over-expanded supersonic nozzles [ONERA, TP NO. 1985-109] p 12 A86-11605

Unsteady aerodynamic characteristics of a blade in pitching oscillations with flow separation. I - The case with laminar separation bubble. II - The case with leading edge stall. III - The case near the stalling angle of attack p 15 A86-12263

**SEPARATORS**

The performance characteristic of an air-separator of an axial flow fan p 15 A86-12267

**SERVICE LIFE**

The influence of thickness in predictions of lifetime and crack propagation in cases involving dynamically loaded aeronautical metal sheets p 57 A86-11774

**SERVOCONTROL**

Servo-elastic oscillations - Control of transient dynamic motion of a plate p 56 A86-11344

**SHEAR LAYERS**

Three articles on new calculation methods in aeronautics (selected articles) [AD-A145745] p 3 N86-10007

Effect of a shear layer on the stability of an axisymmetrical external compression air intake p 16 N86-10010

**SHEAR STRENGTH**

Recent developments in polyimide and bismaleimide adhesives p 53 N86- 1270

**SHEATHS**

Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**SHELL STABILITY**

An assessment of the effect of corrosion wear on the stressed state and durability of plates and shells p 58 A86-12536

**SHELL THEORY**

Mode interaction Hopf bifurcation in axisymmetric shells p 56 A86-11343

**SHELLS (STRUCTURAL FORMS)**

Attachment method-ceramic radome to metal body [AD-D011778] p 30 N86-10032

**SHIPS**

Chemical bonding agent for suppression of rusty bolt intermodulation interference [AD-D011747] p 54 N86-11315

**SHOCK WAVE INTERACTION**

A numerical solution of the shock-turbulent interaction over a compression corner for supersonic flow p 16 N86-10003

**SHOCK WAVE PROFILES**

Second-order-accurate spatial differencing for the transonic small-disturbance equation p 12 A86-11233

**SHOCK WAVE PROPAGATION**

The shock patterns in the two-dimensional inlet with a bleed p 13 A86-11611

**SHOCK WAVES**

Shock fitting in conical supersonic full potential flows p 4 A86-10270

Second order approximation method for transonic flows over swept wings p 16 N86-10002

Shock fitting applied to the prediction of high-speed rotor noise [NASA-TM-86781] p 20 N86-11188

**SHORT TAKEOFF AIRCRAFT**

Ground effects on V/STOL and STOL aircraft - A survey [AIAA PAPER 85-4033] p 24 A86-10962

A parametric evaluation of supersonic STOVL [SAE PAPER 851170] p 25 A86-10974

Runway and maneuvering performance enhanced p 29 A86-11958

Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration [NASA-TM-86782] p 17 N86-10015

**SIGNAL ANALYSIS**

The role of freestream turbulence scale in subsonic flow separation [NASA-CR-176237] p 17 N86-10014

**SIKORSKY AIRCRAFT**

Adaptation of a modern medium helicopter (Sikorsky S-76) to Higher Harmonic Control p 28 A86-11173

**SIMULATION**

Laboratory model of flight through wind shear p 67 N86-11747

**SIMULATORS**

Simulated direct-strike lightning testing at Sandia National Laboratories [DE85-012033] p 49 N86-10049

HOST liner cyclic facilities p 63 N86-11519

**SINGULARITY (MATHEMATICS)**

Theoretical specific impulse for two-phase flow in nozzle of rocket-ramjet engine: A simple estimation method p 51 N86-10005

Analysis of hyperlift systems. Study of a singularities method [SNIAS-443.529/84] p 19 N86-10024

**SIZE DETERMINATION**

Rapid sizing methods for airplanes [AIAA PAPER 85-4031] p 24 A86-10960

**SKIN (STRUCTURAL MEMBER)**

An adhesively sealed, composite skinned wing fuel tank [AIAA PAPER 85-4023] p 23 A86-10956

**SLENDER BODIES**

Comparison of uniform perturbation and numerical solutions for some potential flows past slender bodies p 4 A86-10268

Symmetric separated flow past slender bodies at angles of attack in subsonic and supersonic flows [AIAA PAPER 85-5007] p 10 A86-11062

**SLIPSTREAMS**

A review of ARA research into propeller aerodynamic prediction methods p 42 N86-11151

Wind tunnel investigation of the interaction of propeller slipstream with nacelle/wing/flap combinations p 44 N86-11166

An asymptotic theory for the interference of large aspect ratio swept wings and multiple propeller slipstreams p 44 N86-11167

**SLOPES**

A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear [NASA-TP-2481] p 64 N86-11522

**SLOTTED WIND TUNNELS**

Numerical study of three-dimensional turbulent flow interactions between blockage models and wind tunnels including longitudinally slotted test sections [AIAA PAPER 85-5017] p 10 A86-11065

**SMALL PERTURBATION FLOW**

Second-order-accurate spatial differencing for the transonic small-disturbance equation p 12 A86-11233

**SOFTWARE ENGINEERING**

Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers p 68 A86-11401

SoftCost - A user-friendly software cost estimation tool [AIAA PAPER 85-6009] p 69 A86-11442

**SOFTWARE TOOLS**
Considerations for the implementation of intelligent workstation networks
[AIAA PAPER 85-4001] p 68 A86-10946
PAN AIR consultations using expert system techniques --- computational fluid dynamics tool for aircraft design
[AIAA PAPER 85-4094] p 68 A86-11053
Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers
p 68 A86-11401
Multitask scheduling for time-critical applications
[AIAA PAPER 85-6006] p 68 A86-11441
SoftCost - A user-friendly software cost estimation tool
[AIAA PAPER 85-6009] p 69 A86-11442

**SOILS**
Validation of procedures for pavement design on expansive soils
[FAA-PM-85-15] p 61 N86-11362

**SPACE NAVIGATION**
Computers in Aerospace Conference, 5th, Long Beach, CA, October 21-23, 1985, Technical Papers
p 68 A86-11401

**SPACE STATIONS**
Computational structural mechanics: A new activity at the NASA Langley Research Center
[NASA-TM-87612] p 65 N86-11540

**SPACECRAFT CONTROL**
CRC control systems laboratory gyro test facility
[CRC-1365] p 49 N86-11205

**SPACECRAFT DESIGN**
Manned flight simulation: Challenge and response
[NASA-TM-86827] p 49 N86-10048

**SPACECRAFT ELECTRONIC EQUIPMENT**
Radiation hardened CMOS technology for flight systems
[AIAA PAPER 85-6040] p 56 A86-11460

**SPACECRAFT LANDING**
Aerodynamically landing reentry vehicles
p 50 A86-11768

**SPECIFIC IMPULSE**
The effect of the initial temperature nonuniformity and excess air ratio of the afterburner of a gas-turbine engine on the specific pulse of the nozzle p 40 A86-12531

**SPOILERS**
Comparison between experimental and computational results for airfoils equipped with a spoiler and a flap
[AIAA PAPER 85-5008] p 10 A86-11063

**SPOT WELDS**
Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**STABILITY AUGMENTATION**
Recent progress on compressor stability in France
p 14 A86-11692

**STABILITY DERIVATIVES**
Prediction of fighter aircraft dynamic derivatives using Digital Datcom
[AIAA PAPER 85-4070] p 25 A86-11036

**STAINLESS STEELS**
A type of wire for composites p 52 A86-11734

**STANDARDIZATION**
Operational and support considerations in standardization --- military avionics
[AIAA PAPER 85-5063] p 56 A86-11416

**STANDARDS**
Design standards for unmanned airvehicles (UMAV)
p 22 A86-10365

**STATE ESTIMATION**
Finite wordlength design of digital Kalman filters for state estimation p 67 A86-10180

**STATIC AERODYNAMIC CHARACTERISTICS**
Aerodynamic tradeoff study of conventional, canard, and tri-surface aircraft systems
[AIAA PAPER 85-4071] p 7 A86-11037

**STATIC TESTS**
Design of static reaction gantry for an ultralight airplane destruction test
[AIAA PAPER 85-4022] p 49 A86-10955

**STATORS**
A simple method for evaluating thermal stability of labyrinth seals p 57 A86-11621

**STIFFNESS**
Modeling of the va[illegible] frontal stiffness of the rudder of a dynamically similar empennage model
p 47 A86-12552

**STOCHASTIC PROCESSES**
Stochastic dynamic system suboptimal control with uncertain parameters p 67 A86-10191

**STRAIN ENERGY METHODS**
Application of the local strain method to fatigue life estimation of a wing main beam specimen
p 55 A86-10620

**STRAIN GAGES**
High temperature static strain sensor development program p 62 N86-11500
Demonstration test of burner liner strain measurement systems: Interim results p 62 N86-11501

**STRATUS CLOUDS**
Comparative flight measurement of icing parameters for the propeller aircraft Do-28D2 of the test station 61 of the DFVLR and for the DFVLR aircraft Falon 20e in stratus clouds
[DFVLR-FB-85-16] p 65 N86-10720

**STRESS ANALYSIS**
Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 26 A86-11158
Boeing stress analysis workstation development
[AIAA PAPER 85-6014] p 69 A86-11446
Optimization of airplane wing structures under gust loads p 29 A86-11883
Burner liner thermal/structural load modelling
p 63 N86-11514
Component-specific modeling p 45 N86-11515
Stress analyses of B-52 pylon hooks
[NASA-TM-84924] p 64 N86-11524

**STRESS CONCENTRATION**
The 3D inelastic analysis methods for hot section components p 63 N86-11516
Stress analyses of B-52 pylon hooks
[NASA-TM-84924] p 64 N86-11524

**STRESS CORROSION**
Fatigue, static tensile strength and stress corrosion of aircraft materials and structures
[VTH-LR-360-PT-1] p 32 N86-10045

**STRESS CORROSION CRACKING**
AE monitoring of jet engine breech chambers
p 59 A86-12561

**STRESS MEASUREMENT**
High temperature static strain sensor development program p 62 N86-11500
Demonstration test of burner liner strain measurement systems: Interim results p 62 N86-11501

**STRESS-STRAIN RELATIONSHIPS**
Life prediction and constitutive behavior
p 64 N86-11520

**STRUCTURAL ANALYSIS**
Aerodynamic and structural aspects of propeller and drive for a 1/5 scale wind tunnel programme
p 44 N86-11163
Cabin noise reduction for a new development turboprop commuter aircraft p 71 N86-11173
Propeller aircraft cabin vibration and noise-excitation, sources, and paths p 72 N86-11174
Turbine Engine Hot Section Technology (HOST)
[NASA-CP-2289] p 61 N86-11495
HOST structural analysis program overview
p 45 N86-11513
Burner liner thermal/structural load modelling
p 63 N86-11514
Component-specific modeling p 45 N86-11515
Computational structural mechanics: A new activity at the NASA Langley Research Center
[NASA-TM-87612] p 65 N86-11540

**STRUCTURAL DESIGN**
Structural optimization by multilevel decomposition
p 56 A86-11245
Characteristics of the design and fabrication of large aircraft components in composite materials
p 30 A86-12545
Adhesives for aerospace p 53 N86-11249

**STRUCTURAL DESIGN CRITERIA**
Optimum design of an aircraft wing structure with multiple constraints by the direct-vision criteria method
p 30 N86-10004

**STRUCTURAL MEMBERS**
Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**STRUCTURAL RELIABILITY**
Aircraft structure surveillance in-flight using acoustic emission p 35 A86-12572
Acoustic emission monitoring of aircraft structures
p 59 A86-12575

**STRUCTURAL STABILITY**
Thermoelastic and electromagnetic damping analysis
p 56 A86-11246

**STRUCTURAL VIBRATION**
Planning, creating and documenting a NASTRAN finite element model of a modern-helicopter
p 28 A86-11170
Coupled rotor-body vibrations with inplane degrees of freedom p 28 A86-11171
Analysis of potential helicopter vibration reduction concepts p 28 A86-11172
Servo-elastic oscillations - Control of transient dynamic motion of a plate p 56 A86-11344
Diagnosis and cure for a fatigue problem in the turbine rotor of a small turbo-engine p 38 A86-11623

**STRUTS**
Computational estimations of strut support interference at transonic Mach numbers
[AIAA PAPER 85-5018] p 11 A86-11066

**SUBSONIC AIRCRAFT**
Some aeroacoustic wind tunnel measurements, theoretical predictions, and flight-test correlations on subsonic aircraft propellers p 45 N86-11170

**SUBSONIC FLOW**
Subsonic diffuser design and performance for advanced fighter aircraft
[AIAA PAPER 85-3073] p 5 A86-10934
Subsonic/supersonic linear unsteady analysis
[AIAA PAPER 85-4059] p 7 A86-11030
Numerical experiment with inviscid vortex-stretched flow around a cranked delta wing - Subsonic speed
[AIAA PAPER 85-4080] p 8 A86-11043
Symmetric separated flow past slender bodies at angles of attack in subsonic and supersonic flows
[AIAA PAPER 85-5007] p 10 A86-11062
Extension of the Blasius force theorem to subsonic speeds p 56 A86-11250
Development of a short radial diffuser in the high subsonic and supersonic range with special application to air breathing engines p 14 A86-11639
The role of freestream turbulence scale in subsonic flow separation
[NASA-CR-176237] p 17 N86-10014
A general theory of arbitrary motion aerodynamics using an aeroacoustic approach p 43 N86-11157

**SUBSONIC SPEED**
Summary of work on jet noise prediction
[ESDU-BR-62636] p 71 N86-10909
Wind tunnel investigation of the interaction of propeller slipstream with nacelle/wing/flap combinations
p 44 N86-11166

**SUCTION**
Investigations on a supercritical airfoil with boundary layer suction through a perforated strip in the shock region
[DFVLR-FB-85-15] p 19 N86-10025

**SUPERCAVITATING FLOW**
Bounded flow past a supercavitating finite-span wing
p 5 A86-10729

**SUPERCRITICAL WINGS**
Investigations on a supercritical airfoil with boundary layer suction through a perforated strip in the shock region
[DFVLR-FB-85-15] p 19 N86-10025
Effect of aileron deflections on the aerodynamic characteristics of a semispan model of a subsonic energy-efficient transport
[NASA-TP-2478] p 19 N86-11186

**SUPERPLASTICITY**
Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**SUPERSONIC AIRCRAFT**
A computer-assisted process for supersonic aircraft conceptual design
[AIAA PAPER 85-4027] p 23 A86-10958
A parametric evaluation of supersonic STOVL
[SAE PAPER 851170] p 25 A86-10974
Aerodynamic design considerations for efficient high-lift supersonic wings
[AIAA PAPER 85-4076] p 8 A86-11041
Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270

**SUPERSONIC AIRFOILS**
Second-order-accurate spatial differencing for the transonic small-disturbance equation p 12 A86-11233
The role of computational technic in the development of high performance airbreathing engines
p 37 A86-11603

**SUPERSONIC DIFFUSERS**
Development of a short radial diffuser in the high subsonic and supersonic range with special application to air breathing engines p 14 A86-11639

**SUPERSONIC FLOW**
Shock fitting in conical supersonic full potential flows
p 4 A86-10270
Entropy corrections to supersonic conical nonlinear potential flows p 4 A86-10271
Subsonic/supersonic linear unsteady analysis
[AIAA PAPER 85-4059] p 7 A86-11030
Impact of airfoil profile on the supersonic aerodynamics of delta wings
[AIAA PAPER 85-4073] p 7 A86-11038
Symmetric separated flow past slender bodies at angles of attack in subsonic and supersonic flows
[AIAA PAPER 85-5007] p 10 A86-11062
Three-dimensional flow effects in a two-dimensional air intake with mixed supersonic compression
p 13 A86-11612

A numerical solution of the shock-turbulent interaction over a compression corner for supersonic flow p 16 N86-10003

A new method for calculating unsteady supersonic aerodynamic forces and its application p 16 N86-10009

Forced response analysis of an aerodynamically detuned supersonic turbomachine rotor
[NASA-TM-87093] p 18 N86-10019

Theoretical analysis of linearized acoustics and aerodynamics of advanced supersonic propellers p 43 N86-11156

A general theory of arbitrary motion aerodynamics using an aeroacoustic approach p 43 N86-11157

**SUPERSONIC FLUTTER**

A new method for calculating unsteady supersonic aerodynamic forces and its application p 16 N86-10009

**SUPERSONIC INLETS**

Effect of a shear layer on the stability of an axisymmetrical external compression air intake p 16 N86-10010

**SUPERSONIC NOZZLES**

Study on design of a supersonic nozzle. I - Improvement of a calculating method for a flowfield of mixed type p 5 A86-10480

Estimating water vapor condensation effects for transonic and supersonic flow fields
[AIAA PAPER 85-5020] p 11 A86-11088

A coupled inverse-inverse method for over-expanded supersonic nozzles
[ONERA, TP NO. 1985-109] p 12 A86-11605

**SUPERSONIC WIND TUNNELS**

Supersonic wind tunnel simulation of propulsive jets p 4 A86-10021

**SUPPORT SYSTEMS**

Logistics supportability considerations during conceptual and preliminary design --- of aircraft
[AIAA PAPER 85-3052] p 2 A86-10928

**SUPPORTS**

Acoustic emission studies for detection and monitoring incipient cracks in a simulated aero engine mount under fatigue p 59 A86-12562

**SURFACE ROUGHNESS**

Enhancing aircraft rough airfield capabilities
[AIAA PAPER 85-4018] p 23 A86-10953

Validation of procedures for pavement design on expansive soils
[FAA-PM-85-15] p 61 N86-11362

**SURFACE VEHICLES**

Aircraft gas-turbine engines in ground-based applications --- Russian book p 57 A86-11554

**SURGES**

A method for designing a surge protection device for gas turbine engines p 40 A86-12541

**SWEAT COOLING**

Transportation and impingement/effusion cooling of gas turbine combustion chambers p 40 A86-11697

**SWEPT WINGS**

ADAM - An aeroservoelastic analysis method for analog or digital systems
[AIAA PAPER 85-3090] p 46 A86-10943

An efficient method for computing unsteady transonic aerodynamics of swept wings with control surfaces
[AIAA PAPER 85-4058] p 6 A86-11029

Experimental verification of three-dimensional transonic inverse method
[AIAA PAPER 85-4077] p 8 A86-11042

Numerical experiment with inviscid vortex-stretched flow around a cranked delta wing - Subsonic speed
[AIAA PAPER 85-4080] p 8 A86-11043

Second order approximation method for transonic flows over swept wings p 16 N86-10002

An asymptotic theory for the interference of large aspect ratio swept wings and multiple propeller slipstreams p 44 N86-11167

**SWIRLING**

Scalar and momentum turbulent transport experiments with swirling and nonswirling flows p 58 A86-11938

A study of the swirling of a liquid by porous rotors --- in aircraft engine centrifugal pumps p 40 A86-12532

**SYSTEM IDENTIFICATION**

An analysis of two methods for analysis of dynamic flight test manoeuvres p 45 A86-10160

Structural identification of linear time-invariant dynamic systems under random inputs p 70 A86-11597

**SYSTEMS ANALYSIS**

A dynamic analysis of the dimensional chains of aircraft control systems p 47 A86-12554

**SYSTEMS ENGINEERING**

Integrated systems for component specific design and analysis
[AIAA PAPER 85-3097] p 68 A86-10946

Tactical jamming p 21 A86-12300

The factory of the future p 60 N86-11228

**SYSTEMS INTEGRATION**

Study of turbine bypass remote augmentor lift system for V/STOL aircraft
[AIAA PAPER 85-3086] p 36 A86-10941

Integrated systems for component specific design and analysis
[AIAA PAPER 85-3097] p 68 A86-10946

## T

**TAKEOFF RUNS**

Runway and maneuvering performance enhanced p 29 A86-11958

**TARGET ACQUISITION**

Area search rate and image interpreter performance --- for military RPV p 2 A86-10373

**TARGETS**

Operational philosophy of international full-scale aerial targets p 1 A86-10357

**TECHNOLOGICAL FORECASTING**

Computational fluid dynamics - Its present status and future direction p 55 A86-10267

Unmanned aircraft for the Royal Air Force? p 1 A86-10353

Teaching and learning conceptual design in the CAD era Generating problems and integrating solutions
[AIAA PAPER 85-3081] p 73 A86-10937

Is there a risc in the avionic computer future? --- Reduced Instruction Set Computers
[AIAA PAPER 85-5081] p 34 A86-11427

**TECHNOLOGY ASSESSMENT**

Present and future trends in turbojets and turbofans for R.P.V's p 35 A86-10361

The development of a vertical gyroscope for remotely piloted vehicle (RPV) applications p 55 A86-10372

Aero gas turbine engines for commercial application p 37 A86-11604

Ramjet research in France - Realities and perspectives
[ONERA, TP NO. 1985-108] p 38 A86-11624

The history and foreseeable developments in reciprocating engines for aircraft p 3 A86-11647

Approaches to development of composite materials for aviation industry in China p 52 A86-12313

Deputy minister on sector's technical progress p 4 N86-11178

**TECHNOLOGY UTILIZATION**

New world for aerospace composites p 51 A86-10145

Technology for mini-RPV's p 2 A86-10375

Aircraft gas-turbine engines in ground-based applications --- Russian book p 57 A86-11554

The dirigible: A catalyst for resource exploitation in remote areas?
[AD-A156518] p 31 N86-10034

**TELECOMMUNICATION**

Construction and use of a radio controlled model helicopter for research
[AD-A156547] p 31 N86-10035

**TEMPERATURE DEPENDENCE**

Temperature dependence of inclusion-fracture-related acoustic emissions in 7075-T651 aluminum p 52 A86-12584

**TEMPERATURE EFFECTS**

Jet plume temperature effects on afterbody pressure distribution and drag p 13 A86-11606

The effect of the initial temperature nonuniformity and excess air ratio of the afterburner of a gas-turbine engine on the specific pulse of the nozzle p 40 A86-12531

**TEMPERATURE MEASUREMENT**

Dynamic gas temperature measurement system p 62 N86-11499

**TEMPERATURE MEASURING INSTRUMENTS**

HOST instrumentation R and D program overview p 61 N86-11497

**TEMPERATURE SENSORS**

Development of heat flux sensors for turbine airfoils and combustor liners p 62 N86-11502

**TENSILE STRENGTH**

A type of wire for composites p 52 A86-11734

Fatigue, static tensile strength and stress corrosion of aircraft materials and structures
[VTH-LR-360-PT-1] p 32 N86-10045

**TERMINAL FACILITIES**

Helicopter montage of a path antenna setup for the instrumental landing system SP 70 at Dresden airport p 49 A86-11775

**TERRAIN FOLLOWING AIRCRAFT**

A helicopter terrain following system for terminal area operations
[AIAA PAPER 85-3092] p 34 A86-10944

Simulation evaluation of display/FLIR concepts for low-altitude, terrain-following helicopter operations
[AIAA PAPER 85-3093] p 34 A86-10945

Vision-based road following for an autonomous land vehicle
[AIAA PAPER 85-6047] p 57 A86-11461

**TEST FACILITIES**

Real-time engine testing in the Aeropropulsion Systems Test Facility p 38 A86-11646

CRC control systems laboratory gyro test facility
[CRC-1385] p 49 N86-11205

HOST liner cyclic facilities p 63 N86-11519

**THERMAL STABILITY**

A simple method for evaluating thermal stability of labyrinth seals p 57 A86-11621

Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270

**THERMAL STRESSES**

HOST structural analysis program overview p 45 N86-11513

Burner liner thermal/structural load modelling p 63 N86-11514

The 3D inelastic analysis methods for hot section components p 63 N86-11516

The 3-D inelastic analysis methods for hot section components (base program) p 63 N86-11517

A comparison of measured and calculated thermal stresses in a hybrid metal matrix composite spar cap element
[NASA-TM-86729] p 64 N86-11525

**THERMODYNAMIC CYCLES**

The aerodynamic and thermodynamic design of a small turbojet p 38 A86-11650

**THERMODYNAMICS**

Component-specific modeling p 45 N86-11515

**THERMOELASTICITY**

Thermoelastic and electromagnetic damping analysis p 56 A86-11246

**THICKNESS**

The influence of thickness in predictions of lifetime and crack propagation in cases involving dynamically loaded aeronautical metal sheets p 57 A86-11774

**THIN AIRFOILS**

Effect of hinge gap on aerodynamics of thin airfoils having an oscillating flap p 5 A86-10517

**THIN PLATES**

Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**THIN WALLED SHELLS**

Flutter analysis of a thin-walled lifting surface p 58 A86-12528

A technical-economical analysis of airships of various sizes, shapes, and gas permeability of the shell p 30 A86-12530

**THIN WINGS**

Application of the vortex-lattice concept to flows with smooth-surface separation
[AD-A157571] p 61 N86-11430

**THREE DIMENSIONAL BOUNDARY LAYER**

Solution of viscous transonic flow over wings p 4 A86-10269

Assessment of a 3-D boundary layer code to predict heat transfer and flow losses in a turbine p 62 N86-11508

**THREE DIMENSIONAL FLOW**

Solution of viscous transonic flow over wings p 4 A86-10269

Laser Doppler velocimeter measurements in a 3-D impinging twin-jet fountain flow
[AIAA PAPER 85-4036] p 6 A86-10965

Experimental verification of three-dimensional transonic inverse method
[AIAA PAPER 85-4077] p 8 A86-11042

Optimization of three-dimensional computational grids
[AIAA PAPER 85-4087] p 8 A86-11048

An investigation of gridding on the accuracy of FLO57MM and FLO57MG Euler wing solutions
[AIAA PAPER 85-4090] p 9 A86-11050

Numerical study of three-dimensional turbulent flow interactions between blockage models and wind tunnels including longitudinally slotted test sections
[AIAA PAPER 85-5017] p 10 A86-11065

Three-dimensional calculation of transonic viscous flows by an implicit method p 12 A86-11230

Three-dimensional flow effects in a two-dimensional air intake with mixed supersonic compression p 13 A86-11612

Calculation of external and internal transonic flow field of a three-dimensional S-shaped inlet p 13 A86-11616

Critical examination of turbulence models for a separated three dimensional turbulent boundary layer p 14 A86-12020

Three-dimensional solutions to the Euler equations with one million grid points p 15 A86-12062

Three-dimensional inviscid analysis of radial turbine flow and a limited comparison with experimental data
[NASA-TM-87091] p 17 N86-10317

Aerodynamic method used in France for advanced fast propeller study p 42 N86-11149
Application of the vortex-lattice concept to flows with smooth-surface separation [AD-A157571] p 61 N86-11430

**THRUST MEASUREMENT**
Net thrust calculation sensitivity of an afterburning turbofan engine to variations in input parameters [AIAA PAPER 85-4041] p 36 A86-10969
Determination of the thrust of a bypass engine under operating conditions p 41 A86-12546

**THRUST REVERSAL**
Approach and landing thrust reverser testing in ground effect [AIAA PAPER 85-3075] p 23 A86-10935
Unsteady thrust reverser effects in ground proximity [AIAA PAPER 85-4035] p 24 A86-10964
Application of Gr/PMR-15 to commercial aircraft p 54 N86-11289

**THRUST VECTOR CONTROL**
Preliminary design study of a lateral-directional control system using thrust vectoring [NASA-TM-86425] p 48 N86-11203

**TILT ROTOR AIRCRAFT**
A comparative analysis of a CV helicopter and a JVX (Joint Services Advanced Vertical Lift) tilt-rotor aircraft in an aircraft carrier based ASW (Anti-Submarine Warfare) [AD-A156871] p 31 N86-10041

**TIME LAG**
Control concepts for in-flight simulation including actuator nonlinearities and time delays [DFVLR-FB-85-24] p 48 N86-10047

**TIME OPTIMAL CONTROL**
Quasi-optimal on-line guidence laws for military aircraft [AIAA PAPER 85-1977] p 47 A86-12294

**TIP SPEED**
Comparison of calculated and measured velocities near the tip of a model rotor blade at transonic speeds [NASA-TM-86697] p 33 N86-11196

**TITANIUM**
A comparison of measured and calculated thermal stresses in a hybrid metal matrix composite spar cap element [NASA-TM-86729] p 64 N86-11525

**TITANIUM ALLOYS**
Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**TORSIONAL VIBRATION**
Aeroelastic considerations for torsionally soft rotors p 26 A86-11159
The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 27 A86-11165
Flap-lag-torsion stability in forward flight p 27 A86-11166

**TRACKING RADAR**
The Vega portable radar tracking control system p 20 A86-10368

**TRADEOFFS**
Aerodynamic tradeoff study of conventional, canard, and tri-surface aircraft systems [AIAA PAPER 85-4071] p 7 A86-11037

**TRAILING EDGES**
An experimental investigation into the effects of modifying the trailing edge geometry of a Wortmann FX63-137 aerofoil p 4 A86-10363
Mission-adaptive wing camber control systems for transport aircraft [AIAA PAPER 85-5006] p 46 A86-11061

**TRAINING AIRCRAFT**
Proposed modifications for the RAAF Airtrainer CT-4A cockpit [AD-A156808] p 31 N86-10039

**TRANSATMOSPHERIC VEHICLES**
Aerojet TechSystems develops hypersonic aircraft engine p 40 A86-11955

**TRANSMISSIONS (MACHINE ELEMENTS)**
Design and development of a power takeoff (PTO) shaft for the X-29 Forward Swept Wing (FSW) demonstrator aircraft [AIAA PAPER 85-4045A] p 36 A86-10971
Evaluation of a load cell model for dynamic calibration of the Rotor Systems Research Aircraft p 49 A86-11174

**TRANSONIC FLOW**
Solution of viscous transonic flow over wings p 4 A86-10269
An efficient method for computing unsteady transonic aerodynamics of swept wings with control surfaces [AIAA PAPER 85-4058] p 6 A86-11029
Full potential and Euler solutions for the unsteady transonic flow past a fighter wing [AIAA PAPER 85-4061] p 7 A86-11031
A direct-inverse transonic wing design-analysis method with viscous interactions [AIAA PAPER 85-4075] p 8 A86-11040
Experimental verification of three-dimensional transonic inverse method [AIAA PAPER 85-4077] p 8 A86-11042
An investigation of gridding on the accuracy of FLO57MM and FLO57MG Euler wing solutions [AIAA PAPER 85-4090] p 9 A86-11050
Transonic separated solutions for an augmentor-wing [AIAA PAPER 85-5004] p 10 A86-11059
Computational estimations of strut support interference at transonic Mach numbers [AIAA PAPER 85-5018] p 11 A86-11066
Application of experimental and theoretical methods to validate results obtained on an isolated inlet cowl wind tunnel test rig [AIAA PAPER 85-5019] p 11 A86-11067
Estimating water vapor condensation effects for transonic and supersonic flow fields [AIAA PAPER 85-5020] p 11 A86-11068
Numerical simulation of transonic flow over porous airfoils [AIAA PAPER 85-5022] p 11 A86-11070
Comparison of transonic airfoil characteristics by Navier-Stokes computation and by wind tunnel test at high Reynolds number [AIAA PAPER 85-5025] p 11 A86-11071
Three-dimensional calculation of transonic viscous flows by an implicit method p 12 A86-11230
Second-order-accurate spatial differencing for the transonic small-disturbance equation p 12 A86-11233
Numerical simulation of self-excited oscillations in a ramjet inlet-diffuser flow p 13 A86-11615
Calculation of external and internal transonic flow field of a three-dimensional S-shaped inlet p 13 A86-11616
Acta Aeronautica et Astronautica Sinica (selected articles) [AD-A147304] p 3 N86-10001
Second order approximation method for transonic flows over swept wings p 16 N86-10002
On the design of airfoils in transonic flow using the Euler equations p 17 N86-10013
Aerodynamic method used in France for advanced fast propeller study p 42 N86-11149
Shock fitting applied to the prediction of high-speed rotor noise [NASA-TM-86781] p 20 N86-11188

**TRANSONIC FLUTTER**
ADAM - An aeroservoelastic analysis method for analog or digital systems [AIAA PAPER 85-3090] p 46 A86-10943
An efficient method for computing unsteady transonic aerodynamics of swept wings with control surfaces [AIAA PAPER 85-4058] p 6 A86-11029

**TRANSONIC NOZZLES**
Flow-field computations around nozzle/afterbody configurations at transonic Mach numbers [AIAA PAPER 85-4081] p 8 A86-11044

**TRANSPORT AIRCRAFT**
Aerodynamic bugs - Can CFD spray them away? --- Computational Fluid Dynamics for transport aircraft design [AIAA PAPER 85-4067] p 7 A86-11033
Mission-adaptive wing camber control systems for transport aircraft [AIAA PAPER 85-5006] p 46 A86-11061
Ahrens to build turboprop-powered transport prototypes in Sweden p 30 A86-12013
The dirigible: A catalyst for resource exploitation in remote areas? [AD-A156518] p 31 N86-10034
Retrofit of SAC EC-135C and RC-135 aircraft with CFM-56 engines [AD-A156686] p 31 N86-10036
A review of advanced turboprop transport activities p 41 N86-11148
Problems of the integration of propellers in airframes, especially for high performance twin-engine aircraft p 44 N86-11165
Effect of aileron deflections on the aerodynamic characteristics of a semispan model of a subsonic energy-efficient transport [NASA-TP-2478] p 19 N86-11186

**TURBINE BLADES**
Unsteady aerodynamic characteristics of a blade in pitching oscillations with flow separation. I - The case with laminar separation bubble. II - The case with leading edge stall. III - The case near the stalling angle of attack p 15 A86-12263
State-of-art and prospects of casting turbine blades p 52 A86-12311
Directionally solidified blade superalloy DZ-22 p 52 A86-12314
A study of the effect of rotor blading parameters on the region of acceptable design solutions for the attachment of aircraft compressor blades p 41 A86-12544
Representation of a turbine profile in the form of a Bezier curve p 15 A86-12551
Three-dimensional inviscid analysis of radial turbine flow and a limited comparison with experimental data [NASA-TM-87091] p 17 N86-10017
Development of heat flux sensors for turbine airfoils and combustor liners p 62 N86-11502
Assessment of a 3-D boundary layer code to predict heat transfer and flow losses in a turbine p 62 N86-11508
Coolant passage heat transfer with rotation. A progress report on the computational aspects p 63 N86-11510
The 3D inelastic analysis methods for hot section components p 63 N86-11516
The 3-D inelastic analysis methods for hot section components (base program) p 63 N86-11517
Life prediction and constitutive behavior p 64 N86-11520

**TURBINE ENGINES**
Study of turbine bypass remote augmentor lift system for V/STOL aircraft [AIAA PAPER 85-3086] p 36 A86-10941
Turbine engine Hot Section Technology (HOST) project p 61 N86-11496
HOST instrumentation R and D program overview p 61 N86-11497
Assessment of a 3-D boundary layer code to predict heat transfer and flow losses in a turbine p 62 N86-11508

**TURBINE WHEELS**
Diagnosis and cure for a fatigue problem in the turbine rotor of a small turbo-engine p 38 A86-11623
A study of the swirling of a liquid by porous rotors --- in aircraft engine centrifugal pumps p 40 A86-12532

**TURBINES**
Modern technology application to compressor and turbine aerodynamics p 13 A86-11635

**TURBOCOMPRESSORS**
Determination of high cycle fatigue life of axial compressor blades of turbojet engines fitted in military aircraft p 37 A86-11618
Recent progress on compressor stability in France p 14 A86-11692
A study of the frequency response of a turbojet engine to turbulence-type dynamic distortion p 39 A86-11693
A study of the effect of rotor blading parameters on the region of acceptable design solutions for the attachment of aircraft compressor blades p 41 A86-12544

**TURBOFAN ENGINES**
Present and future trends in turbojets and turbofans for R.P.V's p 35 A86-10361
Aircraft turbofans - New economic and environmental benefits p 36 A86-10500
Net thrust calculation sensitivity of an afterburning turbofan engine to variations in input parameters [AIAA PAPER 85-4041] p 36 A86-10969
Viscous drag reduction with microporous-faced honeycomb sandwich for modern turbofan installations p 29 A86-11607
A study on performances of variable geometry turbofan engines utilizing an approximated analytical method p 38 A86-11648
Tay for two p 40 A86-12010

**TURBOFANS**
The performance characteristic of an air-separator of an axial flow fan p 15 A86-12267

**TURBOJET ENGINES**
Versatile, low cost turhojet propulsion for unmanned vehicles p 35 A86-10360
Present and future trends in turbojets and turbofans for R.P.V's p 35 A86-10361
Determination of high cycle fatigue life of axial compressor blades of turbojet engines fitted in military aircraft p 37 A86-11618
The aerodynamic and thermodynamic design of a small turbojet p 38 A86-11650
A study of the frequency response of a turbojet engine to turbulence-type dynamic distortion p 39 A86-11693
Determination of the thrust of a bypass engine under operating conditions p 41 A86-12546

**TURBOMACHINE BLADES**
A measurement method to evaluate fluid force on blades p 58 A86-12276

**TURBOMACHINERY**
Future directions in aeropropulsion technology p 2 A86-1160
Structure and decay of secondary flow in the downstream of a cascade p 15 A86-12265

**TURBOPROP AIRCRAFT**
Turboprop airliners get bigger - Will they have a market? p 22 A86-10568

Ahrens to build turboprop-powered transport prototypes in Sweden p 30 A86-12013
A review of advanced turboprop transport activities p 41 N86-11148
Summary of recent NASA propeller research p 43 N86-11156
Development of modern turboprop engines p 45 N86-11168
An investigation of in-flight near-field propeller noise generation and transmission p 71 N86-11171
Cabin noise reduction for a new development turboprop commuter aircraft p 71 N86-11173
Propeller aircraft cabin vibration and noise-excitation, sources, and paths p 72 N86-11174
Application of active noise control to model propeller noise p 72 N86-11176

**TURBOPROP ENGINES**
A review of advanced turboprop transport activities p 41 N86-11148

**TURBORAMJET ENGINES**
Aerojet TechSystems develops hypersonic aircraft engine p 40 A86-11955

**TURBOSHAFTS**
Design and development of a power takeoff (PTO) shaft for the X-29 Forward Swept Wing (FSW) demonstrator aircraft
[AIAA PAPER 85-4045A] p 36 A86-10971
Design characteristics of a new generation turboshaft engine p 38 A86-11649

**TURBULENCE**
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A147304] p 3 N86-10001
A numerical solution of the shock-turbulent interaction over a compression corner for supersonic flow p 16 N86-10003
The role of freestream turbulence scale in subsonic flow separation
[NASA-CR-176237] p 17 N86-10014
A model of a downburst, a wind tunnel program on planetary boundary layer, and airship in turbulence p 67 N86-11748

**TURBULENT BOUNDARY LAYER**
The laminar-turbulent transition zone in the boundary layer p 55 A86-10822
A direct-inverse transonic wing design-analysis method with viscous interactions
[AIAA PAPER 85-4075] p 8 A86-11040
A mathematically simple turbulence closure model for attached and separated turbulent boundary layers p 55 A86-11232
Turbulent boundary layer separation on engine components p 14 A86-11675
Critical examination of turbulence models for a separated three dimensional turbulent boundary layer p 14 A86-12020

**TURBULENT FLOW**
Numerical study of three-dimensional turbulent flow interactions between blockage models and wind tunnels including longitudinally slotted test sections
[AIAA PAPER 85-5017] p 10 A86-11065
The separated and non-separated airfoil wake behavior in the presence of free stream turbulence
[AIAA PAPER 85-5027] p 11 A86-11073
A study of the frequency response of a turbojet engine to turbulence-type dynamic distortion p 39 A86-11693
Scalar and momentum turbulent transport experiments with swirling and nonswirling flows p 58 A86-11938
Turbulence characteristics of a plane diffuser flow with inlet velocity distortion p 59 A86-12608

**TURBULENT JETS**
Laser Doppler velocimeter measurements in a 3-D impinging twin-jet fountain flow
[AIAA PAPER 85-4036] p 6 A86-10965

**TURBULENT MIXING**
Concentration distributions in cylindrical combustors p 58 A86-11937

**TWO DIMENSIONAL BOUNDARY LAYER**
A mathematically simple turbulence closure model for attached and separated turbulent boundary layers p 55 A86-11232

**TWO DIMENSIONAL FLOW**
The shock patterns in the two-dimensional inlet with a bleed p 13 A86-11611
Three-dimensional flow effects in a two-dimensional air intake with mixed supersonic compression p 13 A86-11612
Numerical simulation of self-excited oscillations in a ramjet inlet-diffuser flow p 13 A86-11615
Turbulence characteristics of a plane diffuser flow with inlet velocity distortion p 59 A86-12608
Numerical solution of hypersonic flow near leading edge of a flat plate p 16 N86-10008
Aerodynamics of hyperlift systems
[SNIAS-443.501/85] p 18 N86-10023

**TWO PHASE FLOW**
Hostile atmospheric environment effects on jet engines p 39 A86-11665
Theoretical specific impulse for two-phase flow in nozzle of rocket-ramjet engine: A simple estimation method p 51 N86-10005

## U

**U.S.S.R.**
Some comparisons of US and USSR aircraft design developments
[AIAA PAPER 85-3080] p 2 A86-10930

**ULTRALIGHT AIRCRAFT**
Design of static reaction gantry for an ultralight airplane destruction test
[AIAA PAPER 85-4022] p 49 A86-10955
The use of numerical optimization for airfoil design
[AIAA PAPER 85-5026] p 11 A86-11072

**ULTRASONICS**
Evaluation of experimental epoxy monomers p 51 A86-11397

**UNIFORM FLOW**
Comparison of uniform perturbation and numerical solutions for some potential flows past slender bodies p 4 A86-10268

**UNITED STATES**
Some comparisons of US and USSR aircraft design developments
[AIAA PAPER 85-3080] p 2 A86-10930

**UNIVERSITIES**
A computer engineering curriculum for the Air Force Academy: An implementation plan
[AD-A156464] p 70 N86-11857
NASA-universities relationships in aero/space engineering: A review of NASA's program
[NASA-CR-176307] p 73 N86-12158

**UNSTEADY FLOW**
Unsteady thrust reverser effects in ground proximity
[AIAA PAPER 85-4035] p 24 A86-10964
An efficient method for computing unsteady transonic aerodynamics of swept wings with control surfaces
[AIAA PAPER 85-4058] p 6 A86-11029
Subsonic/supersonic linear unsteady analysis
[AIAA PAPER 85-4059] p 7 A86-11030
Full potential and Euler solutions for the unsteady transonic flow past a fighter wing
[AIAA PAPER 85-4061] p 7 A86-11031
Unsteady full potential calculations for complex wing-body configurations
[AIAA PAPER 85-4062] p 7 A86-11032
The pitching delta wing p 12 A86-11227
The governing influence of the nose radius on the unsteady effects of large scale flow structure in the turbulent wing and plate junction flow p 14 A86-11912
A vortex point method for calculating inviscid incompressible flows around rotary wings p 14 A86-12021
Unsteady aerodynamic characteristics of a blade in pitching oscillations with flow separation. I - The case with laminar separation bubble. II - The case with leading edge stall. III - The case near the stalling angle of attack p 15 A86-12263
Characteristics of the flow around rectangular cylinders - The case of the angle of attack 0 deg p 15 A86-12271
A new method for calculating unsteady supersonic aerodynamic forces and its application p 16 N86-10009
A study of the aerodynamic performance of Weis-Fogh wings p 17 N86-10012
Theoretical study of the unsteady linear problem for a rectangular wing with a pitching movement
[ONERA-RT-17/1841-RY-010-R] p 18 N86-10022
A general theory of arbitrary motion aerodynamics using an aeroacoustic approach p 43 N86-11157

**UPPER SURFACE BLOWING**
Noise from a circulation control wing with upper surface blowing
[AIAA PAPER 85-3083] p 5 A86-10939

**USER MANUALS (COMPUTER PROGRAMS)**
User's manual for a 0.3-m TCT wall interference assessment/correction procedure: 8- by 24-inch airfoil test section
[NASA-TM-87582] p 20 N86-11189
User's manual for AC-20-53A protection of airplane fuel systems against fuel vapor ignition due to lightning
[AD-A157619] p 20 N86-11191
KRASH85 user's guide: Input/output format
[FAA-CT-85-10] p 70 N86-11898

## V

**V/STOL AIRCRAFT**
Study of turbine bypass remote augmentor lift system for V/STOL aircraft
[AIAA PAPER 85-3086] p 36 A86-10941
Ground effects on V/STOL and STOL aircraft - A survey
[AIAA PAPER 85-4033] p 24 A86-10962
Development and usage of a small-scale V/STOL ground effects simulator
[AIAA PAPER 85-4037] p 49 A86-10966
A comparison of the NAVTOLAND (Navy vertical takeoff and landing) SH-2F helicopter model with the requirements of MIL-H-8501A and with flight data
[AD-A157297] p 33 N86-11198

**VANELESS DIFFUSERS**
A study of aerodynamic performance of diffusers for centrifugal compressors p 15 A86-12266

**VARIABLE GEOMETRY STRUCTURES**
A study on performances of variable geometry turbofan engines utilizing an approximated analytical method p 38 A86-11648

**VARIABLE SWEEP WINGS**
Computational wing design in support of an NLF variable sweep transition flight experiment --- Natural Laminar Flow
[AIAA PAPER 85-4074] p 7 A86-11039
Optimum wing - For all flight conditions? p 29 A86-11061

**VELOCITY MEASUREMENT**
Ground effect on a rotor wake
[COLL-AERONAUTICS-8510] p 19 N86-11187
Comparison of calculated and measured velocities near the tip of a model rotor blade at transonic speeds
[NASA-TM-86097] p 33 N86-11196

**VERTICAL MOTION**
Precise vertical speed reconstruction based on vertical acceleration and barometric altitude p 34 A86-11762
System modeling and identification of equivalent systems with and without compensating time delay for control-augmented aircraft
[ESA-TT-852] p 32 N86-10043

**VERTICAL MOTION SIMULATORS**
A helicopter terrain following system for terminal area operations
[AIAA PAPER 85-3092] p 34 A86-10944

**VERTICAL TAKEOFF AIRCRAFT**
Laser Doppler velocimeter measurements in a 3-D impinging twin-jet fountain flow
[AIAA PAPER 85-4036] p 6 A86-10965

**VIBRATION**
Aerodynamic and structural aspects of propeller and drive for a 1/5 scale wind tunnel programme p 44 N86-11163
Propeller aircraft cabin vibration and noise-excitation, sources, and paths p 72 N86-11174

**VIBRATION DAMPING**
Decennial Specialists' Meeting on Rotorcraft Dynamics, 2nd, Moffett Field, CA, November 7-9, 1984, Proceedings p 25 A86-11151
The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 27 A86-11165
Analysis of potential helicopter vibration reduction concepts p 28 A86-11172
Adaptation of a modern medium helicopter (Sikorsky S-76) to Higher Harmonic Control p 28 A86-11173
Thermoelastic and electromagnetic damping analysis p 58 A86-11246

**VIBRATORY LOADS**
An examination of the relations between rotor vibratory loads and airframe vibrations p 28 A86-11169

**VISCOUS DRAG**
Viscous drag reduction with microporous-faced honeycomb sandwich for modern turbofan installations p 29 A86-11607

**VISCOUS FLOW**
Computational fluid dynamics - Its present status and future direction p 55 A86-10267
Solution of viscous transonic flow over wings p 4 A86-10269
A direct-inverse transonic wing design-analysis method with viscous interactions
[AIAA PAPER 85-4075] p 8 A86-11040
Transonic separated solutions for an augmentor-wing
[AIAA PAPER 85-5004] p 10 A86-11059
Aerodynamic interaction between vortical wakes and the viscous flow about a circular cylinder
[AIAA PAPER 85-4063] p 12 A86-11096
Three-dimensional calculation of transonic viscous flows by an implicit method p 12 A86-11230
A coupled inverse-inverse method for over-expanded supersonic nozzles
[ONERA, TP NO. 1985-109] p 12 A86-11605

A study of the aerodynamic performance of Weis-Fogh wings p 17 N86-10012

Numerical procedure for three-dimensional hypersonic viscous flow over aerobrake configuration
[NASA-TM-58269] p 18 N86-10018

**VISUAL FLIGHT**

Vision-based road following for an autonomous land vehicle
[AIAA PAPER 85-6047] p 57 A86-11461

**VISUAL FLIGHT RULES**

Visual and motion cueing in helicopter simulation
[NASA-TM-86818] p 50 N86-11208

**VISUAL SIGNALS**

Visual and motion cueing in helicopter simulation
[NASA-TM-86818] p 50 N86-11208

**VORTEX BREAKDOWN**

A unique applied computational method for vortex lift aerodynamics and vortex burst for arbitrary aircraft
[AIAA PAPER 85-4057] p 6 A86-11028

Experimental study of vortex breakdown on a delta wing in incompressible flow
[ONERA, TP NO. 1985-107] p 15 A86-12283

**VORTEX SHEETS**

Analysis of leading-edge vortices on complex configurations
[AIAA PAPER 85-4054] p 6 A86-11026

**VORTICES**

The generation of noise in impinging vortex motion past a step p 70 A86-10177

Nonsymmetric solutions in the problem of flow past a plate with a pair of vortex-sink combinations
p 5 A86-10735

An experimental investigation of apex fence flaps on delta wings
[AIAA PAPER 85-4055] p 6 A86-11027

Numerical experiment with inviscid vortex-stretched flow around a cranked delta wing - Subsonic speed
[AIAA PAPER 85-4080] p 8 A86-11043

Leading edge flap planform effects for wings of moderate leading edge sweep
[AIAA PAPER 85-5005] p 10 A86-11060

Aerodynamic interaction between vortical wakes and the viscous flow about a circular cylinder
[AIAA PAPER 85-4063] p 12 A86-11096

A vortex point method for calculating inviscid incompressible flows around rotary wings
p 14 A86-12021

Structure and decay of secondary flow in the downstream of a cascade p 15 A86-12265

Study of the 3D wake of an aerial propeller
p 43 N86-11161

Application of the vortex-lattice concept to flows with smooth-surface separation
[AD-A157571] p 61 N86-11430

## W

**WAKES**

The separated and non-separated airfoil wake behavior in the presence of free stream turbulence
[AIAA PAPER 85-5027] p 11 A86-11073

Aerodynamic interaction between vortical wakes and the viscous flow about a circular cylinder
[AIAA PAPER 85-4063] p 12 A86-11096

Study of the 3D wake of an aerial propeller
p 43 N86-11161

**WARFARE**

The quest for a helicopter suitable for combat rescue, 1967 - 1983
[AD-A156842] p 31 N86-10040

**WATER VAPOR**

Estimating water vapor condensation effects for transonic and supersonic flow fields
[AIAA PAPER 85-5020] p 11 A86-11068

**WEAPON SYSTEMS**

Logistics considerations for design engineers
[AIAA PAPER 85-3056] p 67 A86-10929

Post-2000 - The multimode aircraft system
[AIAA PAPER 85-4015] p 2 A86-10952

**WEAPONS DEVELOPMENT**

Cost and schedule implications of multinational coproduction --- of weapon systems
[SAE PAPER 851150] p 73 A86-10972

**WEAR**

An assessment of the effect of corrosion wear on the stressed state and durability of plates and shells
p 58 A86-12536

**WEATHER**

Overview of meteorological inputs to NASP
p 66 N86-11736

Airline meteorological requirements
p 66 N86-11737

General aviation's meteorological requirements
p 66 N86-11738

Corporate/commuter airlines meteorological requirements p 66 N86-11739

Adverse weather impact on aviation safety, investigation and oversight p 66 N86-11742

**WEATHER FORECASTING**

Meteorological and Environmental Inputs to Aviation Systems
[NASA-CP-2388] p 66 N86-11735

Overview of meteorological inputs to NASP
p 66 N86-11736

Airline meteorological requirements
p 66 N86-11737

General aviation's meteorological requirements
p 66 N86-11738

Corporate/commuter airlines meteorological requirements p 66 N86-11739

Overview of NASA's programs p 66 N86-11741

**WEDGE FLOW**

A numerical solution of the shock-turbulent interaction over a compression corner for supersonic flow
p 16 N86-10003

**WEIGHT (MASS)**

Operating characteristics of the multiple critical Venturi System and secondary calibration nozzles used for weight-flow measurements in the Langley 16-foot transonic tunnel
[NASA-TM-86405] p 17 N86-10016

**WEIGHT ANALYSIS**

Rapid sizing methods for airplanes
[AIAA PAPER 85-4031] p 24 A86-10960

**WIND SHEAR**

Rotary-wing operations in a microburst environment
[AD-A156695] p 65 N86-10713

Development of a wind shear performance envelope
p 67 N86-11746

Laboratory model of flight through wind shear
p 67 N86-11747

A model of a downburst, a wind tunnel program on planetary boundary layer, and airship in turbulence
p 67 N86-11748

Recognition and control of low level wind shear
[AD-A156500] p 67 N86-11758

**WIND TUNNEL APPARATUS**

Development and usage of a small-scale V/STOL ground effects simulator
[AIAA PAPER 85-4037] p 49 A86-10966

Laser angle sensor
[NASA-CR-172369] p 49 N86-11207

**WIND TUNNEL DRIVES**

Performance evaluation of full scale propellers by wind tunnel test p 43 N86-11160

**WIND TUNNEL MODELS**

Influence of tip blowing on rectangular wings
[AIAA PAPER 85-5001] p 9 A86-11056

Effect of aileron deflections on the aerodynamic characteristics of a semispan model of a subsonic energy-efficient transport
[NASA-TP-2478] p 19 N86-11186

The alternating surface segmented lap joint: A design for thin highly loaded joints p 60 N86-11233

Aeroelastic model helicopter rotor testing in the Langley TDT
[NASA-TM-86440] p 64 N86-11523

**WIND TUNNEL TESTS**

Approach and landing thrust reverser testing in ground effect
[AIAA PAPER 85-3075] p 23 A86-10935

Unsteady thrust reverser effects in ground proximity
[AIAA PAPER 85-4035] p 24 A86-10964

An experimental investigation of apex fence flaps on delta wings
[AIAA PAPER 85-4055] p 6 A86-11027

Prediction of fighter aircraft dynamic derivatives using Digital Datcom
[AIAA PAPER 85-4070] p 25 A86-11036

Experimental verification of three-dimensional transonic inverse method
[AIAA PAPER 85-4077] p 8 A86-11042

Leading edge flap planform effects for wings of moderate leading edge sweep
[AIAA PAPER 85-5005] p 10 A86-11060

Numerical study of three-dimensional turbulent flow interactions between blockage models and wind tunnels including longitudinally slotted test sections
[AIAA PAPER 85-5017] p 10 A86-11065

Computational estimations of strut support interference at transonic Mach numbers
[AIAA PAPER 85-5018] p 11 A86-11066

Application of experimental and theoretical methods to validate results obtained on an isolated inlet cowl wind tunnel test rig
[AIAA PAPER 85-5019] p 11 A86-11067

Comparison of transonic airfoil characteristics by Navier-Stokes computation and by wind tunnel test at high Reynolds number
[AIAA PAPER 85-5025] p 11 A86-11071

The separated and non-separated airfoil wake behavior in the presence of free stream turbulence
[AIAA PAPER 85-5027] p 11 A86-11073

Performance of a top-mounted inlet system applied on two combat aircraft concepts p 29 A86-11614

Effect of the Reynolds number on the aerodynamic characteristics of an ogive-cylinder at high angle of attack p 14 A86-12022

Characteristics of the flow around rectangular cylinders - The case of the angle of attack 0 deg
p 15 A86-12271

Second order approximation method for transonic flows over swept wings p 16 N86-10002

Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration
[NASA-TM-86782] p 17 N86-10015

Operating characteristics of the multiple critical Venturi System and secondary calibration nozzles used for weight-flow measurements in the Langley 16-foot transonic tunnel
[NASA-TM-86405] p 17 N86-10016

Performance evaluation of full scale propellers by wind tunnel test p 43 N86-11160

Study of the 3D wake of an aerial propeller
p 43 N86-11161

Aerodynamic and structural aspects of propeller and drive for a 1/5 scale wind tunnel programme
p 44 N86-11163

Wind tunnel investigation of the interaction of propeller slipstream with nacelle/wing/flap combinations
p 44 N86-11166

Aeroacoustic wind tunnel measurements on propeller noise p 71 N86-11169

Some aeroacoustic wind tunnel measurements, theoretical predictions, and flight-test correlations on subsonic aircraft propellers p 45 N86-11170

Full-scale flight and model-scale wind tunnel tests on the nearfield noise characteristics of aircraft propellers
p 71 N86-11172

Ground effect on a rotor wake
[COLL-AERONAUTICS-8510] p 19 N86-11187

User's manual for a 0.3-m TCT wall interference assessment/correction procedure: 8- by 24-inch airfoil test section
[NASA-TM-87582] p 20 N86-11189

**WIND TUNNEL WALLS**

User's manual for a 0.3-m TCT wall interference assessment/correction procedure: 8- by 24-inch airfoil test section
[NASA-TM-87582] p 20 N86-11189

**WING CAMBER**

Mission-adaptive wing camber control systems for transport aircraft
[AIAA PAPER 85-5006] p 46 A86-11061

Optimum wing - For all flight conditions?
p 29 A86-11961

**WING FLAPS**

Effect of hinge gap on aerodynamics of thin airfoils having an oscillating flap p 5 A86-10517

An experimental investigation of apex fence flaps on delta wings
[AIAA PAPER 85-4055] p 6 A86-11027

Leading edge flap planform effects for wings of moderate leading edge sweep
[AIAA PAPER 85-5005] p 10 A86-11060

Comparison between experimental and computational results for airfoils equipped with a spoiler and a flap
[AIAA PAPER 85-5008] p 10 A86-11063

The alternating surface segmented lap joint: A design for thin highly loaded joints p 60 N86-11233

**WING FLOW METHOD TESTS**

Full potential and Euler solutions for the unsteady transonic flow past a fighter wing
[AIAA PAPER 85-4061] p 7 A86-11031

**WING NACELLE CONFIGURATIONS**

A technique for the inverse aerodynamic design of nacelles and wing configurations
[AIAA PAPER 85-4096] p 9 A86-11054

**WING OSCILLATIONS**

Subsonic/supersonic linear unsteady analysis
[AIAA PAPER 85-4059] p 7 A86-11030

Flutter analyses of a thin-walled lifting surface
p 58 A86-12528

**WING PANELS**

Optimum design of an aircraft wing structure with multiple constraints by the direct-vision criteria method
p 30 N86-10004

Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**WING PLANFORMS**

An efficient method for computing unsteady transonic aerodynamics of swept wings with control surfaces
[AIAA PAPER 85-4058] p 6 A86-11029

Leading edge flap planform effects for wings of moderate leading edge sweep
[AIAA PAPER 85-5005] p 10 A86-11060
The governing influence of the nose radius on the unsteady effects of large scale flow structure in the turbulent wing and plate junction flow
p 14 A86-11912

**WING PROFILES**
A direct-inverse transonic wing design-analysis method with viscous interactions
[AIAA PAPER 85-4075] p 8 A86-11040
Transonic separated solutions for an augmentor-wing
[AIAA PAPER 85-5004] p 10 A86-11059
A study of the aerodynamic performance of Weis-Fogh wings p 17 N86-10012
Aerodynamics of hyperlift systems
[SNIAS-443.501/85] p 18 N86-10023

**WING SLOTS**
Noise from a circulation control wing with upper surface blowing
[AIAA PAPER 85-3083] p 5 A86-10939

**WING SPAN**
Bounded flow past a supercavitating finite-span wing
p 5 A86-10729
The concept of lateral blowing
[AIAA PAPER 85-5000] p 9 A86-11055

**WING TANKS**
An adhesively sealed, composite skinned wing fuel tank
[AIAA PAPER 85-4023] p 23 A86-10956

**WING TIP VORTICES**
An investigation of gridding on the accuracy of FLO57MM and FLO57MG Euler wing solutions
[AIAA PAPER 85-4090] p 9 A86-11050

**WING TIPS**
The concept of lateral blowing
[AIAA PAPER 85-5000] p 9 A86-11055
Influence of tip blowing on rectangular wings
[AIAA PAPER 85-5001] p 9 A86-11056

**WINGS**
Solution of viscous transonic flow over wings
p 4 A86-10269
Some fabrication experiments towards a composite RPV wing p 51 A86-10364
Application of the local strain method to fatigue life estimation of a wing main beam specimen
p 55 A86-10620
Optimization of airplane wing structures under gust loads p 29 A86-11883
Three-dimensional solutions to the Euler equations with one million grid points p 15 A86-12062
The alternating surface segmented lap joint: A design for thin highly loaded joints p 60 N86-11233
A comparison of measured and calculated thermal stresses in a hybrid metal matrix composite spar cap element
[NASA-TM-86729] p 64 N86-11525

**WIRE**
A type of wire for composites p 52 A86-11734

**WORKSTATIONS**
Considerations for the implementation of intelligent workstation networks
[AIAA PAPER 85-4001] p 68 A86-10948
Boeing stress analysis workstation development
[AIAA PAPER 85-6014] p 69 A86-11446

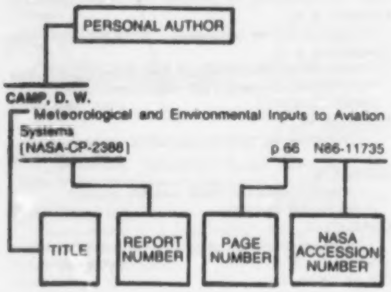
## X

**X WING ROTORS**
Development status of the RSRA/X-Wing --- Rotor System Research Aircraft
[AIAA PAPER 85-4008] p 23 A86-10951

**X-29 AIRCRAFT**
Design and development of a power takeoff (PTO) shaft for the X-29 Forward Swept Wing (FSW) demonstrator aircraft
[AIAA PAPER 85-4045A] p 36 A86-10971

# PERSONAL AUTHOR INDEX

### Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABID, R.**
Critical examination of turbulence models for a separated three dimensional turbulent boundary layer
p 14 A86-12020

**ACETO, L. D.**
Coolant passage heat transfer with rotation. A progress report on the computational aspects p 63 N86-11510

**ADACHI, T.**
Structure and decay of secondary flow in the downstream of a cascade p 15 A86-12265

**ADAMS, N. F.**
The status of a low cost gas turbine programme
p 35 A86-10362

**AGRELL, J.**
Supersonic wind tunnel simulation of propulsive jets
p 4 A86-10021

**AHMED, S. A.**
Concentration distributions in cylindrical combustors
p 58 A86-11937

**AHUJA, K. K.**
Noise from a circulation control wing with upper surface blowing
[AIAA PAPER 85-3083] p 5 A86-10939

**AKASHITA, K.**
Structure and decay of secondary flow in the downstream of a cascade p 15 A86-12265

**AL-DABBAGH, N. A.**
Combustion and emissions performance of a rapid fuel and air mixing combustor p 52 A86-11698

**ALFORD, D. W.**
The development of a vertical gyroscope for remotely piloted vehicle (RPV) applications p 55 A86-10372

**ALJABRI, A. S.**
Wind tunnel investigation of the interaction of propeller slipstream with nacelle/wing/flap combinations
p 44 N86-11166

**ALLDRIDGE, W. J.**
Now is the time for remotely piloted helicopters
p 1 A86-10359

**ANDERSON, K. W.**
Proposed modifications for the RAAF Airtrainer CT-4A cockpit
[AD-A158808] p 31 N86-10039

**ANDO, S.**
Effect of hinge gap on aerodynamics of thin airfoils having an oscillating flap p 5 A86-10517

**ANDRESON, R. K.**
LHX program overview
[AIAA PAPER 85-4006] p 2 A86-10950

**ANDREWS, G. E.**
Transportation and impingement/effusion cooling of gas turbine combustion chambers p 40 A86-11697
Combustion and emissions performance of a rapid fuel and air mixing combustor p 52 A86-11698

**ARDEBILI, M.**
The separated and non-separated airfoil wake behavior in the presence of free stream turbulence
[AIAA PAPER 85-5027] p 11 A86-11073

**ARONOV, B. M.**
A study of the effect of rotor blading parameters on the region of acceptable design solutions for the attachment of aircraft compressor blades
p 41 A86-12544

**ARTT, D. W.**
The status of a low cost gas turbine programme
p 35 A86-10362

**ASERE, A. A.**
Transportation and impingement/effusion cooling of gas turbine combustion chambers p 40 A86-11697

**ASWATHA NARAYANA, P. A.**
Turbulence characteristics of a plane diffuser flow with inlet velocity distortion p 59 A86-12608

**ATKINSON, W. H.**
Development of heat flux sensors for turbine airfoils and combustor liners p 62 N86-11502

**ATLURI, S. N.**
Servo-elastic oscillations - Control of transient dynamic motion of a plate p 56 A86-11344

**AUSTIN, E. E.**
Ground resonance analysis using a substructure modeling approach p 25 A86-11152

**AUSTIN, R. G.**
Now is the time for remotely piloted helicopters
p 1 A86-10359

**AZARSKOV, V. N.**
Structural identification of linear time-invariant dynamic systems under random inputs p 70 A86-11597

## B

**BAHRAMI, M.**
Evaluation of a load cell model for dynamic calibration of the Rotor Systems Research Aircraft
p 49 A86-11174

**BAILEY, R.**
High temperature static strain sensor development program p 62 N86-11500

**BALENA, F. J.**
Propeller aircraft cabin vibration and noise-excitation, sources, and paths p 72 N86-11174

**BANGERT, L. S.**
Operating characteristics of the multiple critical Venturi System and secondary calibration nozzles used for weight-flow measurements in the Langley 16-foot transonic tunnel
[NASA-TM-86405] p 17 N86-10016

**BARBEAU, D. E.**
Versatile, low cost turbojet propulsion for unmanned vehicles p 35 A86-10360

**BARBER, D. J.**
Performance evaluation of full scale propellers by wind tunnel test p 43 N86-11160

**BARNETT, R. J.**
The role of freestream turbulence scale in subsonic flow separation
[NASA-CR-176237] p 17 N86-10014

**BARSONY-NAGY, A.**
Extension of the Blasius force theorem to subsonic speeds p 56 A86-11250

**BARTON, L. A.**
Predicate/transition network analysis of redundant channel synchronization
[AIAA PAPER 85-6020] p 69 A86-11450

**BASS, R. M.**
Aerodynamic and structural aspects of propeller and drive for a 1/5 scale wind tunnel programme
p 44 N86-11163

**BAUER, R. C.**
Estimating water vapor condensation effects for transonic and supersonic flow fields

**YEUNG, S. K.**
CRC control systems laboratory gyro test facility
[CRC-1385] p 49 N86-11205

**YOSHINAGA, Y.**
A study of aerodynamic performance of diffusers for centrifugal compressors
p 15 A86-12266

**YOUNG, R. E.**
Flight worthiness of fire resistant hydraulic systems. Volume 1
[AD-A157618] p 33 N86-11199

**YOUNT, L. J.**
Fault effect protection and partitioning for fly-by-wire/fly-by-light avionics systems
[AIAA PAPER 85-6002] p 47 A86-11439

**YU, N. J.**
Flow simulations for detailed nacelle-exhaust flow using Euler equations
[AIAA PAPER 85-5003] p 10 A86-11058

**YU, S.**
Effect of a shear layer on the stability of an axisymmetrical external compression air intake
p 16 N86-10010

**YUNG, K.**
State-of-art and prospects of casting turbine blades
p 52 A86-12311

**Z**

**ZHANG, K.**
Effect of a shear layer on the stability of an axisymmetrical external compression air intake
p 16 N86-10010

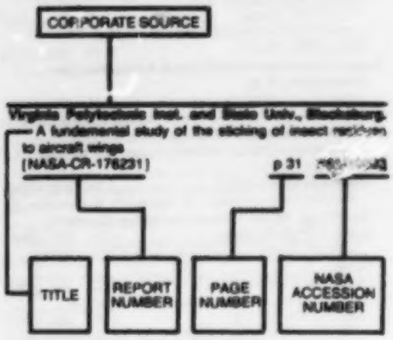
**ZHANG, X.**
Numerical modeling of afterburner combustion
p 38 A86-11641

**ZHURAVLEV, O. A.**
High-speed laser photorecording of a fuel nozzle jet
p 41 A86-12555

**ZIMMER, H.**
Investigations of modern general aviation propellers
p 44 N86-11162

# CORPORATE SOURCE INDEX

### Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231]
p 31
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).**
Aerodynamics and Acoustics of Propellers
[AGARD-CP-366] p 3 N86-11147

**Aeritalia S.p.A., Pomigliano D'Arco (Italy).**
Cabin noise reduction for a new development turboprop commuter aircraft p 71 N86-11173

**Aeronautical Research Labs., Melbourne (Australia).**
A review of Australian investigations on aeronautical fatigue during the period April 1983 to March 1985
[AD-A156602] p 31 N86-10036
Proposed modifications for the RAAF Airtrainer CT-4A cockpit
[AD-A156806] p 31 N86-10039

**Air Command and Staff Coll., Maxwell AFB, Ala.**
The dirigible: A catalyst for resource exploitation in remote areas?
[AD-A156518] p 31 N86-10034
Retrofit of SAC EC-135C and RC-135 aircraft with CFM-56 engines
[AD-A156668] p 31 N86-10038
The quest for a helicopter suitable for combat rescue, 1967 - 1983
[AD-A156842] p 31 N86-10040
Rotary-wing operations in a microburst environment
[AD-A156695] p 65 N86-10713
Let's get serious about software
[AD-A156819] p 70 N86-10831
Coming soon to a theater near you: The microwave landing system
[AD-A156488] p 20 N86-11190
Evaluation of fault reporting/fault isolation for F-15 aircraft
[AD-A156516] p 33 N86-11197
Recognition and control of low level wind shear
[AD-A156500] p 67 N86-11758
A computer engineering curriculum for the Air Force Academy: An implementation plan
[AD-A156464] p 70 N86-11857

**Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.**
Generation of flight paths using hierarchical planning
[AD-A156805] p 70 N86-10900

**Air Force Systems Command, Wright-Patterson AFB, Ohio.**
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A147304] p 3 N86-10001
Second order approximation method for transonic flows over swept wings p 16 N86-10002
A numerical solution of the shock-turbulent interaction over a compression corner for supersonic flow p 16 N86-10003
Optimum design of an aircraft wing structure with multiple constraints by the direct-vision criteria method p 30 N86-10004
Theoretical specific impulse for two-phase flow in nozzle of rocket-ramjet engine: A simple estimation method p 51 N86-10005
Three articles on new calculation methods in aeronautics (selected articles)
[AD-A145745] p 3 N86-10007
Numerical solution of hypersonic flow near leading edge of a flat plate p 16 N86-10008
A new method for calculating unsteady supersonic aerodynamic forces and its application p 16 N86-10009
Effect of a shear layer on the stability of an axisymmetrical external compression air intake p 16 N86-10010
Comment on Determination of Aerodynamic Coefficients for a Reentry Body by Means of the Kalman Filter Method p 16 N86-10011

**Aircraft Research Association Ltd., Bedford (England).**
A review of ARA research into propeller aerodynamic prediction methods p 42 N86-11151

**American Cyanamid Co., Stamford, Conn.**
Recent developments in polyimide and bismaleimide adhesives p 53 N86-11270

**Arizona State Univ., Tempe.**
Concentration distributions in cylindrical combustors p 58 A86-11937
Jet array impingement heat transfer characteristics p 63 N86-11511

**Army Propulsion Lab., Cleveland, Ohio.**
Combustion research for gas turbine engines p 37 A86-11609

**Army Structures Lab., Hampton, Va.**
Aeroelastic considerations for torsionally soft rotors p 26 A86-11159

**Avions Marcel Dassault, Saint-Cloud (France).**
Problems of the integration of propellers in airframes, especially for high performance twin-engine aircraft p 44 N86-11165

## B

**Boeing Aerospace Co., Seattle, Wash.**
Laser angle sensor
[NASA-CR-172369] p 49 N86-11207

**Boeing Commercial Airplane Co., Seattle, Wash.**
Environmental stability graphite/PMR-15 composites p 53 N86-11284
Development of design data for propulsion PMR-15 composites p 54 N86-11285
Application of Gr/PMR-15 to commercial aircraft p 54 N86-11289

**Boeing Vertol Co., Philadelphia, Pa.**
Planning, creating and documenting a NASTRAN finite element model of a modern-helicopter p 28 A86-11170

**Business and Commercial Aviation, White Plains, N.Y.**
Corporate/commuter airlines meteorological requirements p 66 N86-11739

## C

**California State Polytechnic Univ., Pomona.**
Development and usage of a small-scale V/STOL ground effects simulator
[AIAA PAPER 85-4037] p 49 A86-10966

**California Univ., Los Angeles.**
Influence of various unsteady aerodynamic models on the aeromechanical stability of a helicopter in ground resonance p 27 A86-11164

**Calspan Advanced Technology Center, Buffalo, N.Y.**
Mission-oriented requirements for updating MIL-H-8501: Calspan proposed structure and rationale
[NASA-CR-177371] p 48 N86-11204

**Carleton Univ., Ottawa (Ontario).**
Development of modern turboprop engines p 45 N86-11168

**Centre National de la Recherche Scientifique, Orsay (France).**
Design concept and performance prediction technique for potential flows around advanced propellers p 42 N86-11150

**Charles River Associates, Inc., Cambridge, Mass.**
Performance analysis of a fault inferring nonlinear detection system algorithm with integrated avionics flight data
[AIAA PAPER 85-6022] p 69 A86-11452

**Coast Guard, Elizabeth City, N.C.**
Adverse weather impact on aviation safety, investigation and oversight p 66 N86-11742

**Colorado Univ., Boulder.**
Numerical simulation of transonic flow over porous airfoils
[AIAA PAPER 85-5022] p 11 A86-11070

**Communications Research Centre, Ottawa (Ontario).**
CRC control systems laboratory gyro test facility
[CRC-1385] p 49 N86-11205

**Connecticut Univ., Storrs.**
Scalar and momentum turbulent transport experiments with swirling and nonswirling flows p 58 A86-11938

**Cranfield Inst. of Tech., Bedford (England).**
On the aerodynamics of installed propellers p 42 N86-11154
Ground effect on a rotor wake
[COLL-AERONAUTICS-8510] p 19 N86-11187

## D

**De Havilland Aircraft Co. of Canada Ltd., Downsview (Ontario).**
Performance evaluation of full scale propellers by wind tunnel test p 43 N86-11160
Some considerations in propeller and airframe integration p 44 N86-11164

**Delta Air Lines, Inc., Atlanta, Ga.**
Airline meteorological requirements p 66 N86-11737

**Department of the Air Force, Washington, D.C.**
Submerged ram air inlets for ECM (electronic countermeasures) pods
[AD-D011801] p 18 N86-10020
Attachment method-ceramic radome to metal body
[AD-D011778] p 30 N86-10032

**Department of the Navy, Washington, D. C.**
AIRBOC (air rapid bloom offboard chaff) chaff deployment system
[AD-D011746] p 60 N86-10554
Chemical bonding agent for suppression of rusty bolt intermodulation interference
[AD-D011747] p 54 N86-11315

**Detroit Diesel Allison, Mich.**
Gas side heat transfer p 62 N86-11507

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick (West Germany).**
Control concepts for in-flight simulation including actuator nonlinearities and time delays
[DFVLR-FB-85-24] p 48 N86-10047
A unified approach for the aerodynamics and acoustics of propellers in forward motion p 42 N86-11155
Full-scale flight and model-scale wind tunnel tests on the nearfield noise characteristics of aircraft propellers p 71 N86-11172

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (West Germany).**

Investigations on a supercritical airfoil with boundary layer suction through a perforated strip in the shock region
[DFVLR-FB-85-15] p 19 N86-10025

Experimental and theoretical investigations of the flow around airfoil systems with ground effect
[DFVLR-FB-85-17] p 19 N86-10026

Aeroacoustic wind tunnel measurements on propeller noise p 71 N86-11169

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen (West Germany).**

Comparative flight measurement of icing parameters for the propeller aircraft Do-28D2 of the test station 61 of the DFVLR and for the DFVLR aircraft Falcon 20e in stratus clouds
[DFVLR-FB-85-16] p 65 N86-10720

User manual for the Falcon system
[DFVLR-MITT-85-08] p 65 N86-10721

**Dornier-Werke G.m.b.H., Friedrichshafen (West Germany).**

Investigations of modern general aviation propellers
p 44 N86-11162

**Douglas Aircraft Co., Inc., Long Beach, Calif.**

Advances in joining techniques used in development of SPF/DB titanium sandwich reinforced with metal matrices p 60 N86-11247

**Dowty Rotol Ltd., Gloucester (England).**

Aerodynamic and structural aspects of propeller and drive for a 1/5 scale wind tunnel programme
p 44 N86-11163

## E

**Electromagnetic Compatibility Analysis Center, Annapolis, Md.**

Traffic Alert and Collision Avoidance System Signal Environment Model (TCAS SEM) programmer's reference manual
[FAA-PM-85-22] p 21 N86-11192

**Engineering and Economics Research, Inc., Vienna, Va.**

Enhanced airport surface detection equipment applications
[AD-A157541] p 50 N86-11210

**ESDU International Ltd., London (England).**

Summary of work on jet noise prediction
[ESDU-BR-62636] p 71 N86-10909

**European Space Agency, Paris (France).**

System modeling and identification of equivalent systems with and without compensating time delay for control-augmented aircraft
[ESA-TT-852] p 32 N86-10043

## F

**Federal Aviation Administration, Atlantic City, N.J.**

User's manual for AC-20-53A protection of airplane fuel systems against fuel vapor ignition due to lightning
[AD-A157619] p 20 N86-11191

Overview of FAA's aircraft icing program
p 66 N86-11740

A new characterization of supercooled clouds below 10,000 feet AGL p 66 N86-11744

**Federal Aviation Administration, Washington, D.C.**

Overview of meteorological inputs to NASP
p 66 N86-11736

**Flying Tigers-Retired, San Pedro, Calif.**

Development of a wind shear performance envelope
p 67 N86-11746

**Fraunhofer-Inst. fuer Betriebsfestigkeit, Darmstadt (West Germany).**

Review of investigations on aeronautical fatigue in the Federal Republic of Germany
[LBF-S-173] p 32 N86-10044

## G

**General Dynamics/Convair, San Diego, Calif.**

Effects of real-time thermal aging on graphite/polyimide composites p 53 N86-11283

**General Dynamics Corp., Fort Worth, Tex.**

Study of turbine bypass remote augmentor lift system for V/STOL aircraft
[AIAA PAPER 85-3086] p 36 A86-10941

**General Dynamics/Fort Worth, Tex.**

A parametric evaluation of supersonic STOVL
[SAE PAPER 851170] p 25 A86-10974

**General Electric Co., Cincinnati, Ohio.**

Fabrication process of a high temperature polymer matrix engine duct p 54 N86-11290

Burner liner thermal/structural load modelling
p 63 N86-11514

Component-specific modeling p 45 N86-11515

The 3D inelastic analysis methods for hot section components p 63 N86-11516

**George Washington Univ., Washington, D.C.**

Comparison of uniform perturbation and numerical solutions for some potential flows past slender bodies
p 4 A86-10268

**Georgia Inst. of Tech., Atlanta.**

A study of the aerodynamic performance of Weis-Fogh wings p 17 N86-10012

**Grumman Aerospace Corp., Bethpage, N.Y.**

Solution of viscous transonic flow over wings
p 4 A86-10269

## H

**Hamilton Standard, Windsor Locks, Conn.**

The state of the art in propfan turboprop noise
p 72 N86-11175

## I

**IBM Federal Systems Div., Owego, N. Y.**

A helicopter terrain following system for terminal area operations
[AIAA PAPER 85-3092] p 34 A86-10944

Simulation evaluation of display/FLIR concepts for low-altitude, terrain-following helicopter operations
[AIAA PAPER 85-3093] p 34 A86-10945

**IIT Research Inst., Annapolis, Md.**

Traffic Alert and Collision Avoidance System Signal Environment Model (TCAS SEM) programmer's reference manual
[FAA-PM-85-22] p 21 N86-11192

**Information Spectrum, Inc., Arlington, Va.**

F-16X MSIP (Multi-national Staged Improvement Program) case example: Operating and support cost estimation using VAMOSC (Visibility And Management Of Operating and Support Costs)
[AD-A156893] p 3 N86-10006

**Institut de Mecanique des Fluides de Marseille (France).**

Study of the 3D wake of an aerial propeller
p 43 N86-11161

## J

**Joint Publications Research Service, Arlington, Va.**

Deputy minister on sector's technical progress
p 4 N86-11178

World's largest airplane now being tested
p 32 N86-11181

## K

**Kansas Univ., Lawrence.**

Design of static reaction gantry for an ultralight airplane destruction test
[AIAA PAPER 85-4022] p 49 A86-10955

Inlet flow dynamic distortion prediction without rms measurements p 19 N86-11183

**Kentron International, Inc., Hampton, Va.**

Structural optimization by multilevel decomposition
p 56 A86-11245

## L

**Lockheed-California Co., Burbank.**

A general theory of arbitrary motion aerodynamics using an aeroacoustic approach p 43 N86-11157

Propeller aircraft cabin vibration and noise-excitation, sources, and paths p 72 N86-11174

KRASH85 user's guide: Input/output format
[FAA-CT-85-10] p 70 N86-11898

**Lockheed-Georgia Co., Marietta.**

A review of advanced turboprop transport activities
p 41 N86-11148

Wind tunnel investigation of the interaction of propeller slipstream with nacelle/wing/flap combinations
p 44 N86-11166

Application of active noise control to model propeller noise p 72 N86-11176

Adhesives for aerospace p 53 N86-11249

**LTV Aerospace and Defense Co., Dallas, Tex.**

The factory of the future p 60 N86-11228

## M

**McDonnell Automation Co., St. Louis, Mo.**

Flight worthiness of fire resistant hydraulic systems: Volume 1
[AD-A157618] p 33 N86-11199

**Mississippi Univ. for Women, Columbus.**

Evaluation of experimental epoxy monomers
p 51 A86-11397

## N

**National Academy of Sciences - National Research Council, Washington, D. C.**

NASA-universities relationships in aero/space engineering: A review of NASA's program
[NASA-CR-176307] p 73 N86-12158

Overview of NASA's programs p 66 N86-11741

**National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.**

A helicopter terrain following system for terminal area operations
[AIAA PAPER 85-3092] p 34 A86-10944

Simulation evaluation of display/FLIR concepts for low-altitude, terrain-following helicopter operations
[AIAA PAPER 85-3093] p 34 A86-10945

Ground effects on V/STOL and STOL aircraft - A survey
[AIAA PAPER 85-4033] p 24 A86-10962

A parametric evaluation of supersonic STOVL
[SAE PAPER 851170] p 25 A86-10974

Transonic separated solutions for an augmentor-wing
[AIAA PAPER 85-5004] p 10 A86-11059

Numerical simulation of transonic flow over porous airfoils
[AIAA PAPER 85-5022] p 11 A86-11070

Aerodynamic interaction between vortical wakes and the viscous flow about a circular cylinder
[AIAA PAPER 85-4063] p 12 A86-11096

The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 27 A86-11165

A mathematically simple turbulence closure model for attached and separated turbulent boundary layers
p 55 A86-11232

Second-order-accurate spatial differencing for the transonic small-disturbance equation p 12 A86-11233

Numerical simulation of self-excited oscillations in a ramjet inlet-diffuser flow p 13 A86-11615

Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration
[NASA-TM-86782] p 17 N86-10015

Manned flight simulation: Challenge and response
[NASA-TM-86827] p 49 N86-10046

Shock fitting applied to the prediction of high-speed rotor noise
[NASA-TM-86781] p 20 N86-11188

Expert systems development and application
[NASA-TM-86746] p 32 N86-11194

Description of an experimental expert system flight status monitor
[NASA-TM-86791] p 32 N86-11195

Comparison of calculated and measured velocities near the tip of a model rotor blade at transonic speeds
[NASA-TM-86697] p 33 N86-11196

Visual and motion cueing in helicopter simulation
[NASA-TM-86818] p 50 N86-11208

Stress analyses of B-52 pylon hooks
[NASA-TM-84924] p 64 N86-11524

A comparison of measured and calculated thermal stresses in a hybrid metal matrix composite spar cap element
[NASA-TM-86729] p 64 N86-11525

**National Aeronautics and Space Administration. Flight Research Center, Edwards, Calif.**

Net thrust calculation sensitivity of an afterburning turbofan engine to variations in input parameters
[AIAA PAPER 85-4041] p 36 A86-10969

**National Aeronautics and Space Administration. Johnson (Lyndon B.) Space Center,**

Numerical procedure for three-dimensional hypersonic viscous flow over aerobrake configuration
[NASA-TM-58269] p 18 N86-10018

**National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.**

Filament winding - Waking the sleeping giant
p 54 A86-10146

Comparison of uniform perturbation and numerical solutions for some potential flows past slender bodies
p 4 A86-10268

Some comparisons of US and USSR aircraft design developments
[AIAA PAPER 85-3060] p 2 A86-10930

A computer-assisted process for supersonic aircraft conceptual design
[AIAA PAPER 85-4027] p 23 A86-10958

Impact of airfoil profile on the supersonic aerodynamics of delta wings
[AIAA PAPER 85-4073] p 7 A86-11038

Computational wing design in support of an NLF variable sweep transition flight experiment
[AIAA PAPER 85-4074] p 7 A86-11039

Aerodynamic design considerations for efficient high-lift supersonic wings
[AIAA PAPER 85-4073] p 8 A86-11041

Lifting surface theory for a helicopter rotor in forward flight p 12 A86-11157

Aeroelastic considerations for torsionally soft rotors p 26 A86-11159

Structural optimization by multilevel decomposition p 56 A86-11245

Finite difference solutions of the Euler equations in the vicinity of sharp edges p 12 A86-11255

Evaluation of experimental epoxy monomers p 51 A86-11397

Performance analysis of a fault inferring nonlinear detection system algorithm with integrated avionics flight data
[AIAA PAPER 85-6022] p 69 A86-11452

Operating characteristics of the multiple critical Venturi System and secondary calibration nozzles used for weight-flow measurements in the Langley 16-foot transonic tunnel
[NASA-TM-86405] p 17 N86-10016

Fatigue of graphite/epoxy buffer strip panels with center cracks
[NASA-TM-87595] p 60 N86-10581

Theoretical analysis of linearized acoustics and aerodynamics of advanced supersonic propellers p 43 N86-11156

An asymptotic theory for the interference of large aspect ratio swept wings and multiple propeller slipstreams p 44 N86-11167

Effect of aileron deflections on the aerodynamic characteristics of a semispan model of a subsonic energy-efficient transport
[NASA-TP-2478] p 19 N86-11186

User's manual for a 0.3-m TCT wall interference assessment/correction procedure: 8- by 24-inch airfoil test section
[NASA-TM-87582] p 20 N86-11189

Preliminary design study of a lateral-directional control system using thrust vectoring
[NASA-TM-86425] p 48 N86-11203

The alternating surface segmented lap joint: A design for thin highly loaded joints p 60 N86-11233

A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear
[NASA-TP-2481] p 64 N86-11522

Aeroelastic model helicopter rotor testing in the Langley TDT
[NASA-TM-86440] p 64 N86-11523

Computational structural mechanics: A new activity at the NASA Langley Research Center
[NASA-TM-87612] p 65 N86-11540

**National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.**

Future directions in aeropropulsion technology p 2 A86-11602

Combustion research for gas turbine engines p 37 A86-11609

Three-dimensional inviscid analysis of radial turbine flow and a limited comparison with experimental data
[NASA-TM-87091] p 17 N86-10017

Forced response analysis of an aerodynamically detuned supersonic turbomachine rotor
[NASA-TM-87093] p 18 N86-10019

Summary of recent NASA propeller research p 43 N86-11158

Surface protection of graphite fabric/PMR-15 composites subjected to thermal oxidation p 53 N86-11281

Turbine Engine Hot Section Technology (HOST)
[NASA-CP-2289] p 61 N86-11495

Turbine engine Hot Section Technology (HOST) project p 61 N86-11496

HOST instrumentation R and D program overview p 61 N86-11497

Turbine heat transfer p 62 N86-11505

Combustion hot section technology p 45 N86-11512

HOST structural analysis program overview p 45 N86-11513

HOST liner cyclic facilities p 63 N86-11519

Life prediction and constitutive behavior p 64 N86-11520

**National Aeronautics and Space Administration. Marshall Space Flight Center, Huntsville, Ala.**

Heavy lift launch vehicles for 1995 and beyond
[NASA-TM-86520] p 51 N86-11216

Meteorological and Environmental Inputs to Aviation Systems
[NASA-CP-2388] p 66 N86-11735

**National Aerospace Lab., Amsterdam (Netherlands).**

Aerospace research at NLR p 73 N86-11089

Aerodynamics of wide-chord propellers in non-axisymmetric flow p 42 N86-11153

**Naval Air Development Center, Warminster, Pa.**

A comparison of the NAVTOLAND (Navy vertical takeoff and landing) SH-2F helicopter model with the requirements of MIL-H-8501A and with flight data
[AD-A157297] p 33 N86-11198

**Naval Postgraduate School, Monterey, Calif.**

Construction and use of a radio controlled model helicopter for research
[AD-A156547] p 31 N86-10035

A comparative analysis of a CV helicopter and a JVX (Joint Services Advanced Vertical Lift) tilt-rotor aircraft in an aircraft carrier based ASW (Anti-Submarine Warfare)
[AD-A156871] p 31 N86-10041

**Naval Research Lab., Washington, D. C.**

A new characterization of the icing environment below 10,000 feet AGL from 7,000 miles of measurements in supercooled clouds p 66 N86-11743

**Naval Ship Research and Development Center, Bethesda, Md.**

Application of the vortex-lattice concept to flows with smooth-surface separation
[AD-A157571] p 61 N86-11430

**New Mexico Univ., Albuquerque.**

Validation of procedures for pavement design on expansive soils
[FAA-PM-85-15] p 61 N86-11362

General aviation's meteorological requirements p 66 N86-11738

**North Carolina State Univ., Raleigh.**

An experimental investigation of apex fence flaps on delta wings
[AIAA PAPER 85-4055] p 6 A86-11027

### O

**Office National d'Etudes et de Recherches Aerospatiales, Paris (France).**

Theoretical study of the unsteady linear problem for a rectangular wing with a pitching movement
[ONERA-RT-17/1841-RY-010-R] p 18 N86-10022

Aerodynamic method used in France for advanced fast propeller study p 42 N86-11149

Modern propeller profiles p 42 N86-11152

### P

**Pratt and Whitney Aircraft, East Hartford, Conn.**

Dynamic gas temperature measurement system p 62 N86-11499

The 3-D inelastic analysis methods for hot section components (base program) p 63 N86-11517

Creep fatigue life prediction for engine hot section materials (isotropic) p 64 N86-11521

**Pratt and Whitney Aircraft Group, East Hartford, Conn.**

Development of heat flux sensors for turbine airfoils and combustor liners p 62 N86-11502

Coolant passage heat transfer with rotation. A progress report on the computational aspects p 63 N86-11510

**Pratt and Whitney Aircraft Group, West Palm Beach, Fla.**

Current and future engine applications of Gr/PI composites p 54 N86-11291

**Pratt and Whitney Aircraft of Canada Ltd., Longueuil (Quebec).**

An investigation of in-flight near-field propeller noise generation and transmission p 71 N86-11171

**Princeton Univ., N. J.**

On the design of airfoils in transonic flow using the Euler equations p 17 N86-10013

### R

**Royal Aircraft Establishment, Farnborough (England).**

Some aeroacoustic wind tunnel measurements, theoretical predictions, and flight-test correlations on subsonic aircraft propellers p 45 N86-11170

### S

**Sandia National Labs., Albuquerque, N. Mex.**

Inviscid flow field analysis of maneuvering hypersonic vehicles using the SCM formulation and parabolic grid generation
[DE85-013950] p 18 N86-10021

Simulated direct-strike lightning testing at Sandia National Laboratories
[DE85-012033] p 49 N86-10049

Understanding and improving acoustic to seismic coupling as it pertains to Sandia's helicopter detector
[DE85-009440] p 71 N86-10920

**Scientific Research Associates, Inc., Glastonbury, Conn.**

Numerical study of three-dimensional turbulent flow interactions between blockage models and wind tunnels including longitudinally slotted test sections
[AIAA PAPER 85-5017] p 10 A86-11065

**Societe Nationale Industrielle Aerospatiale, Marignane (France).**

Dynamic behavior of a propfan p 43 N86-11159

**Societe Nationale Industrielle Aerospatiale, Suresnes (France).**

Nondestructive control of thick structures made without disassembling
[PV-43-954/F/3] p 60 N86-10564

Nondestructive corrosion test of aluminum alloy structures
[PV-43-954/F/2] p 60 N86-10594

**Societe Nationale Industrielle Aerospatiale, Toulouse (France).**

Aerodynamics of hyperlift systems
[SNIAS-443.501/85] p 18 N86-10023

Analysis of hyperlift systems. Study of a singularities method
[SNIAS-443.529/84] p 19 N86-10024

**Spectron Development Labs., Inc., Costa Mesa, Calif.**

Advance particle and Doppler measurement methods p 67 N86-11745

**State Univ. of New York, Binghamton.**

Comparison of uniform perturbation and numerical solutions for some potential flows past slender bodies p 4 A86-10268

### T

**Technische Hogeschool, Delft (Netherlands).**

Fatigue, static tensile strength and stress corrosion of aircraft materials and structures
[VTH-LR-360-PT-1] p 32 N86-10045

**Tennessee Univ. Space Inst., Tullahoma.**

Laboratory model of flight through wind shear p 67 N86-11747

**Texas A&M Univ., College Station.**

Comparison of predicted and measured drag for a single-engine airplane
[AIAA PAPER 85-4038] p 24 A86-10967

A numerical method of calculating propeller noise including acoustic nonlinear effects p 72 N86-12011

**Texas Instruments, Inc., Dallas.**

A helicopter terrain following system for terminal area operations
[AIAA PAPER 85-3092] p 34 A86-10944

**Texas Technological Univ., Lubbock.**

Electromagnetic resonances of cylinders and aircraft model with resistive wires
[NASA-CR-176250] p 32 N86-10042

**Toronto Univ. (Ontario).**

A model of a downburst, a wind tunnel program on planetary boundary layer, and airship in turbulence p 67 N86-11748

### U

**United Technologies Research Center, East Hartford, Conn.**

Analysis of potential helicopter vibration reduction concepts p 28 A86-11172

Scalar and momentum turbulent transport experiments with swirling and nonswirling flows p 58 A86-11938

Hot section viewing system p 61 N86-11498

High temperature static strain sensor development program p 62 N86-11500

Demonstration test of burner liner strain measurement systems: Interim results p 62 N86-11501

Assessment of a 3-D boundary layer code to predict heat transfer and flow losses in a turbine p 62 N86-11508

## V

**Vanderbilt Univ., Nashville, Tenn.**
The role of freestream turbulence scale in subsonic flow separation
[NASA-CR-176237] p 17 N86-10014

**Virginia Polytechnic Inst. and State Univ., Blacksburg.**
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231] p 31 N86-10033

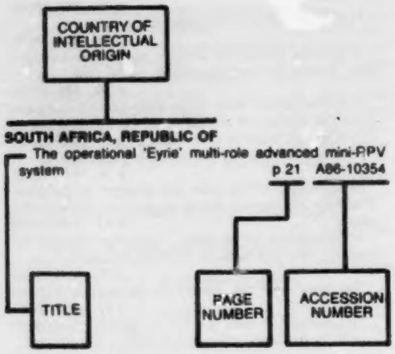
## W

**Westland Helicopters Ltd., Yeovil (England).**
Trials on the asperity counting monitoring system
[RES-PAPER-670] p 59 N86-10550

# FOREIGN TECHNOLOGY INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 197)* FEBRUARY 1986

### Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system
p 21 A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the usur in locating the citation in the abstract section.

## A

**AUSTRALIA**

Finite wordlength design of digital Kalman filters for state estimation p 67 A86-10180

Three-dimensional flow effects in a two-dimensional air intake with mixed supersonic compression p 13 A86-11612

Engine performance monitoring in helicopters p 39 A86-11661

Procedures for trending aircraft gas turbine engine performance p 39 A86-11662

Turbulent boundary layer separation on engine components p 14 A86-11675

In-flight AE monitoring p 59 A86-12573

A review of Australian investigations on aeronautical fatigue during the period April 1983 to March 1985
[AD-A156602] p 31 N86-10036

Proposed modifications for the RAAF Airtrainer CT-4A cockpit
[AD-A156808] p 31 N86-10039

## B

**BELGIUM**

An analysis of two methods for analysis of dynamic flight test manoeuvres p 45 A86-10160

## C

**CANADA**

Condor - A Canadian RPA for commercial applications p 22 A86-10374

Development of a short radial diffuser in the high subsonic and supersonic range with special application to air breathing engines p 14 A86-11639

Problems of ignition correlations - An assessment of applications to real combustors p 52 A86-11694

Acoustic emission monitoring of aircraft structures p 59 A86-12575

Temperature dependence of inclusion-fracture-related acoustic emissions in 7075-T651 aluminum p 52 A86-12584

Performance evaluation of full scale propellers by wind tunnel test p 43 N86-11160

Some considerations in propeller and airframe integration p 44 N86-11164

Development of modern turboprop engines p 45 N86-11168

An investigation of in-flight near-field propeller noise generation and transmission p 71 N86-11171

CRC control systems laboratory gyro test facility
[CRC-1385] p 49 N86-11205

**CHINA, PEOPLE'S REPUBLIC OF**

Application of the local strain method to fatigue life estimation of a wing main beam specimen p 55 A86-10620

The shock patterns in the two-dimensional inlet with a bleed p 13 A86-11611

Calculation of external and internal transonic flow field of a three-dimensional S-shaped inlet p 13 A86-11616

Numerical modeling of afterburner combustion p 38 A86-11641

A study of the frequency response of a turbojet engine to turbulence-type dynamic distortion p 39 A86-11693

State-of-art and prospects of casting turbine blades p 52 A86-12311

Approaches to development of composite materials for aviation industry in China p 52 A86-12313

Directionally solidified blade superalloy DZ-22 p 52 A86-12314

Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A147304] p 3 N86-10001

Second order approximation method for transonic flows over swept wings p 16 N86-10002

A numerical solution of the shock-turbulent interaction over a compression corner for supersonic flow p 16 N86-10003

Optimum design of an aircraft wing structure with multiple constraints by the direct-vision criteria method p 30 N86-10004

Theoretical specific impulse for two-phase flow in nozzle of rocket-ramjet engine: A simple estimation method p 51 N86-10005

Three articles on new calculation methods in aeronautics (selected articles)
[AD-A145745] p 3 N86-10007

Numerical solution of hypersonic flow near leading edge of a flat plate p 16 N86-10008

A new method for calculating unsteady supersonic aerodynamic forces and its application p 16 N86-10009

Effect of a shear layer on the stability of an axisymmetrical external compression air intake p 16 N86-10010

Comment on Determination of Aerodynamic Coefficients for a Reentry Body by Means of the Kalman Filter Method p 16 N86-10011

## F

**FRANCE**

Comparison between experimental and computational results for airfoils equipped with a spoiler and a flap
[AIAA PAPER 85-5008] p 10 A86-11063

The use of numerical optimization for airfoil design
[AIAA PAPER 85-5026] p 11 A86-11072

Three-dimensional calculation of transonic viscous flows by an implicit method p 12 A86-11230

The role of computational technic in the development of high performance airbreathing engines p 37 A86-11603

A coupled inverse-inverse method for over-expanded supersonic nozzles
[ONERA, TP NO. 1985-109] p 12 A86-11605

Development of new combustor technologies at SNECMA p 37 A86-11610

Ramjet research in France - Realities and perspectives
[ONERA, TP NO. 1985-108] p 38 A86-11624

Recent progress on compressor stability in France p 14 A86-11692

Critical examination of turbulence models for a suparated three dimensional turbulent boundary layer p 14 A86-12020

A vortex point method for calculating inviscid incompressible flows around rotary wings p 14 A86-12021

Effect of the Reynolds number on the aerodynamic characteristics of an ogive-cylinder at high angle of attack p 14 A86-12022

Dynamic stall modeling of the NACA 0012 profile p 14 A86-12024

Helicopter noise p 71 A86-12025

Experimental study of vortex breakdown on a delta wing in incompressible flow
[ONERA, TP NO. 1985-107] p 15 A86-12283

Quasi-optimal on-line guidance laws for military aircraft
[AIAA PAPER 85-1977] p 47 A86-12294

Theoretical study of the unsteady linear problem for a rectangular wing with a pitching movement
[ONERA-RT-17/1841-RY-010-R] p 18 N86-10022

Aerodynamics of hyperlift systems
[SNIAS-443.501/85] p 18 N86-10023

Analysis of hyperlift systems. Study of a singularities method
[SNIAS-443.529/84] p 19 N86-10024

Nondestructive control of thick structures made without disassembling
[PV-43-954/F/3] p 60 N86-10564

Nondestructive corrosion test of aluminum alloy structures
[PV-43-954/F/2] p 60 N86-10594

Aerodynamics and Acoustics of Propellers
[AGARD-CP-366] p 3 N86-11147

Aerodynamic method used in France for advanced fast propeller study p 42 N86-11149

Design concept and performance prediction technique for potential flows around advanced propellers p 42 N86-11150

Modern propeller profiles p 42 N86-11152

Dynamic behavior of a propfan p 43 N86-11159

Study of the 3D wake of an aerial propeller p 43 N86-11161

Problems of the integration of propellers in airframes, especially for high performance twin-engine aircraft p 44 N86-11165

## G

**GERMANY,FEDERAL REPUBLIC OF**

Computational fluid dynamics - Its present status and future direction p 55 A86-10267

Technology for mini-RPV's p 2 A86-10375

Comparison of results from a panel method and an Euler code for a cranked delta wing
[AIAA PAPER 85-4091] p 9 A86-11051

Mission-adaptive wing camber control systems for transport aircraft
[AIAA PAPER 85-5006] p 46 A86-11061

Modern technology application to compressor and turbine aerodynamics p 13 A86-11635

Design characteristics of a new generation turboshaft engine p 38 A86-11649

Deposits in aircraft engines. I - Type of deposits and test methods p 40 A86-11757

Precise vertical speed reconstruction based on vertical acceleration and barometric altitude p 34 A86-11762

Aerodynamically landing reentry vehicles p 50 A86-11768

Aerodynamically landing reentry vehicles p 50 A86-11769

Repair of air-cooled turbine vanes of high-performance aircraft engines - Problems and experience p 3 A86-11872

Investigations on a supercritical airfoil with boundary layer suction through a perforated strip in the shock region
[DFVLR-FB-85-15] p 19 N86-10025

Experimental and theoretical investigations of the flow around airfoil systems with ground effect
[DFVLR-FB-85-17] p 19 N86-10026

System modeling and identification of equivalent systems with and without compensating time delay for control-augmented aircraft
[ESA-TT-852] p 32 N86-10043

Review of investigations on aeronautical fatigue in the Federal Republic of Germany
[LBF-S-173] p 32 N86-10044

Control concepts for in-flight simulation including actuator nonlinearities and time delays
[DFVLR-FB-85-24] p 48 N86-10047

Comparative flight measurement of icing parameters for the propeller aircraft Do-28D2 of the test station 61 of the DFVLR and for the DFVLR aircraft Falon 20e in stratus clouds
[DFVLR-FB-85-16] p 65 N86-10720

User manual for the Falcon system
[DFVLR-MITT-85-08] p 65 N86-10721

A unified approach for the aerodynamics and acoustics of propellers in forward motion p 42 N86-11155

Investigations of modern general aviation propellers
p 44 N86-11162

Aeroacoustic wind tunnel measurements on propeller noise p 71 N86-11169

Full-scale flight and model-scale wind tunnel tests on the nearfield noise characteristics of aircraft propellers
p 71 N86-11172

**GERMANY,PEOPLES DEMOCRATIC REPUBLIC OF**

Helicopter montage of a path antenna setup for the instrumental landing system SP 70 at Dresden airport
p 49 A86-11775

**GREECE**

Certain algorithms related to 'engine condition monitoring' systems p 39 A86-11664

The influence of thickness in predictions of lifetime and crack propagation in cases involving dynamically loaded aeronautical metal sheets p 57 A86-11774

## H

**HONG KONG**

On flaw size and distribution in lap joints
p 57 A86-11755

## I

**INDIA**

Experimental RPV - An Indian experience
p 21 A86-10355

Some fabrication experiments towards a composite RPV wing p 51 A86-10364

The laminar-turbulent transition zone in the boundary layer p 55 A86-10822

Symmetric separated flow past slender bodies at angles of attack in subsonic and supersonic flows
[AIAA PAPER 85-5007] p 10 A86-11062

A review of dynamic inflow and its effect on experimental correlations p 27 A86-11163

Jet plume temperature effects on afterbody pressure distribution and drag p 13 A86-11606

Optimisation of recess-action conformal profiles for aero gas-turbine engine gears - A computer based analytical approach p 57 A86-11617

Determination of high cycle fatigue life of axial compressor blades of turbojet engines fitted in military aircraft p 37 A86-11618

A simple method for evaluating thermal stability of labyrinth seals p 57 A86-11621

Acoustic emission studies for detection and monitoring incipient cracks in a simulated aero engine mount under fatigue p 59 A86-12562

In-flight monitoring for incipient cracks in an aero engine mount - An approach through pattern recognition
p 35 A86-12574

Turbulence characteristics of a plane diffuser flow with inlet velocity distortion p 59 A86-12608

**ISRAEL**

Portable tactical display systems for RPV's
p 48 A86-10376

Extension of the Blasius force theorem to subsonic speeds p 56 A86-11250

**ITALY**

The aerodynamic and thermodynamic design of a small turbojet p 38 A86-11650

Cabin noise reduction for a new development turboprop commuter aircraft p 71 N86-11173

## J

**JAPAN**

Correction of lift coefficient for tandem circular-cascade diffusers p 55 A86-10476

The effect of acoustically lined walls on cascade flutter p 36 A86-10477

Study on design of a supersonic nozzle. I - Improvement of a calculating method for a flowfield of mixed type
p 5 A86-10480

Prediction of outlet flow characteristics of centrifugal impellers. I - Consideration of velocity distortion
p 55 A86-10481

Effect of hinge gap on aerodynamics of thin airfoils having an oscillating flap p 5 A86-10517

Experimental verification of three-dimensional transonic inverse method
[AIAA PAPER 85-4077] p 8 A86-11042

Comparison of transonic airfoil characteristics by Navier-Stokes computation and by wind tunnel test at high Reynolds number
[AIAA PAPER 85-5025] p 11 A86-11071

JT9D engine/module performance deterioration results from back to back testing p 39 A86-11663

Initial dispersion of jet engine exhaust plume
p 39 A86-11666

Unsteady aerodynamic characteristics of a blade in pitching oscillations with flow separation. I - The case with laminar separation bubble. II - The case with leading edge stall. III - The case near the stalling angle of attack
p 15 A86-12263

Structure and decay of secondary flow in the downstream of a cascade p 15 A86-12265

A study of aerodynamic performance of diffusers for centrifugal compressors p 15 A86-12266

The performance characteristic of an air-separator of an axial flow fan p 15 A86-12267

Characteristics of the flow around rectangular cylinders - The case of the angle of attack 0 deg
p 15 A86-12271

Aerodynamic resistance of perforated plates in natural convection p 58 A86-12272

A measurement method to evaluate fluid force on blades p 58 A86-12276

## N

**NETHERLANDS**

Teaching and learning conceptual design in the CAD era Generating problems and integrating solutions
[AIAA PAPER 85-3081] p 73 A86-10937

Fatigue, static tensile strength and stress corrosion of aircraft materials and structures
[VTH-LR-360-PT-1] p 32 N86-10045

Aerospace research at NLR p 73 N86-11089

Aerodynamics of wide-chord propellers in non-axisymmetric flow p 42 N86-11153

## S

**SOUTH AFRICA, REPUBLIC OF**

The operational 'Eyrie' multi-role advanced mini-RPV system p 21 A86-10354

Diagnosis and cure for a fatigue problem in the turbine rotor of a small turbo-engine p 38 A86-11623

Experimental results from a reverse flow annual combustor p 57 A86-11696

**SPAIN**

A study on performances of variable geometry turbofan engines utilizing an approximated analytical method
p 38 A86-11648

**SWEDEN**

Numerical experiment with inviscid vortex-stretched flow around a cranked delta wing - Subsonic speed
[AIAA PAPER 85-4080] p 8 A86-11043

Performance of a top-mounted inlet system applied on two combat aircraft concepts p 29 A86-11614

Three-dimensional solutions to the Euler equations with one million grid points p 15 A86-12062

**SWITZERLAND**

Is the 680 rotor Bell's LHX candidate?
p 22 A86-10566

Turboprop airliners get bigger - Will they have a market? p 22 A86-10568

## U

**U.S.S.R.**

Theory of local interaction in a rarefied gas - Variant of the method of tangent cones p 5 A86-10658

Bounded flow past a supercavitating finite-span wing
p 5 A86-10729

Nonsymmetric solutions in the problem of flow past a plate with a pair of vortex-sink combinations
p 5 A86-10735

Fundamental aspects of the theory of continuous Markovian controllable systems and the application of this theory p 70 A86-11535

Aircraft gas-turbine engines in ground-based applications p 57 A86-11554

Structural identification of linear time-invariant dynamic systems under random inputs p 70 A86-11597

A type of wire for composites p 52 A86-11734

Development and application of mathematical models of aircraft p 29 A86-11945

Methodology of the flight testing of the flight-control and navigation equipment of aircraft and helicopters
p 21 A86-12046

Flutter analysis of a thin-walled lifting surface
p 58 A86-12528

A technical-economical analysis of airships of various sizes, shapes, and gas permeability of the shell
p 30 A86-12530

The effect of the initial temperature nonuniformity and excess air ratio of the afterburner of a gas-turbine engine on the specific impulse of the nozzle p 40 A86-12531

A study of the swirling of a liquid by porous rotors
p 40 A86-12532

Determination of the order and structure of the linear differential equations of aircraft motion from experimental results p 47 A86-12535

An assessment of the effect of corrosion wear on the stressed state and durability of plates and shells
p 58 A86-12536

The problem of determining the optimum parameters of an autopilot p 47 A86-12539

The problem of selecting the parameters of a flight vehicle on the basis of the motion stability requirement
p 47 A86-12540

A method for designing a surge protection device for gas turbine engines p 40 A86-12541

A study of the effect of rotor blading parameters on the region of acceptable design solutions for the attachment of aircraft compressor blades
p 41 A86-12544

Characteristics of the design and fabrication of large aircraft components in composite materials
p 30 A86-12545

Determination of the thrust of a bypass engine under operating conditions p 41 A86-12546

A study of a turbine stage with a twisted vaned diffuser p 41 A86-12548

Unsteady operation of the fuel nozzles of the main combustion chamber of a gas-turbine engine
p 41 A86-12549

Representation of a turbine profile in the form of a Bezier curve p 15 A86-12551

Modeling of the variable frontal stiffness of the rudder of a dynamically similar empennage model
p 47 A86-12552

A dynamic analysis of the dimensional chains of aircraft control systems p 47 A86-12554

High-speed laser photorecording of a fuel nozzle jet
p 41 A86-12555

A method for the modal synthesis of an aircraft lateral motion control law p 47 A86-12557

Assuring the reliability of aircraft engines
p 41 A86-12599

Reliability of wide-body aircraft p 59 A86-12600

Full-scale testing of the VNII NP-261 lubricant
p 53 A86-12607

Deputy minister on sector's technical progress
p 4 N86-11178

World's largest airplane now being tested
p 32 N86-11181

**UNITED KINGDOM**

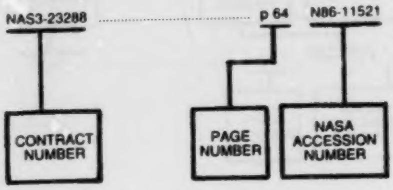
The effect of changes in aircraft noise exposure
p 65 A86-12447
Trials on the asperity counting monitoring system
[RES-PAPER-670] p 58 N86-10550
Summary of work on jet noise prediction
[ESDU-BR-62636] p 71 N86-10909
A review of ARA research into propeller aerodynamic prediction methods p 42 N86-11151
On the aerodynamics of installed propellers
p 42 N86-11154
Aerodynamic and structural aspects of propeller and drive for a 1/5 scale wind tunnel programme
p 44 N86-11163
Some aeroacoustic wind tunnel measurements, theoretical predictions, and flight-test correlations on subsonic aircraft propellers p 45 N86-11170
Ground effect on a rotor wake
[COLL-AERONAUTICS-8510] p 19 N86-11187

# CONTRACT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 197)* FEBRUARY 1986

### Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

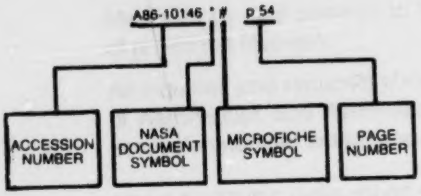
# ACCESSION NUMBER INDEX

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on page vii.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

### FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. Over 1,300 other depositories also exists. A list of the regional GPO libraries appears on the inside back cover.

**A FUNDAMENTAL STUDY OF THE STICKING OF INSECT RESIDUES TO AIRCRAFT WINGS Annual Technical Report**

N. S. EISS, JR., J. P. WIGHTMAN, D. R. GILLIAM, and E. J. SIOCHI Apr. 1985 191 p refs

(Contract NAG1-300)

(NASA-CR-176231; NAS 1.26:176231) Avail: NTIS HC A09/MF A01 CSCL 01C

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

**AERODYNAMIC DESIGN CONSIDERATIONS FOR EFFICIENT HIGH-LIFT SUPERSONIC WINGS**

D. S. MILLER and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs

(AIAA PAPER 85-4076)

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 395 reports, journal articles, and other documents originally announced in February 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 75

**Category 02 Aerodynamics** 76
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 90
Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 92
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 94
Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 102
Includes cockpit and cabin display devices; and flight instruments.

**Category 07 Aircraft Propulsion and Power** 104
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 108
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 111
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 114
Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 114
Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 117
Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 124
Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** 125
Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 126
Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 129
Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 130
Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** 131
Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

## AERONAUTICS (GENERAL)

**A86-13446**

**TECHNOLOGICAL SUPPORT FOR AIRCRAFT PRODUCTION [TEKHNOLOGICHESKAIA PODGOTOVKA AVIATSIONNOGO PROIZVODSTVA]**

V. N. KRYSIN Moscow, Izdatel'stvo Mashinostroenie, 1984, 200 p. In Russian. refs

The organization of technological support for aircraft production is reviewed with particular reference to the development of new equipment and processes to reduce the time required for setting up aircraft production. The discussion covers the fundamentals of technological support planning, standardization of equipment and processes, computer-aided design of manufacturing processes, automation of software development for digitally controlled machine tools, and the use of laser technology in installing assembly lines. Other topics discussed include equipment for the fabrication of composite structures, the manufacture of large components from high-strength titanium alloy sheets, and the use of manipulators and industrial robots. V.L.

**A86-13549**

**MANUFACTURERS PREPARE FOR EUROPE'S NEW FIGHTERS**

B. WANSTALL Interavia (ISSN 0020-5168), vol. 40, Oct. 1985, p. 1133-1136.

Carbon, boron, and Kevlar fiber-reinforced polymer matrix composites are being extensively employed in the French 'Rafale' ground attack aircraft and the British-German-Italian-Spanish 'European Fighter Aircraft' (EFA) interceptor. Al-Li alloys are also under consideration, subject to their development to the required levels of economy. Attention is presently given to the similarities and differences that have become evident to date in the Rafale and EFA development programs, which are scheduled to result in maiden flights in 1986. Full authority digital fly-by-wire systems will be used by both aircraft, and are noted to be the basis of significant weight savings through lift and control surfaces' area reduction. Single crewmember operation will be achieved through advanced cockpit display and controller electronics. O.C.

**A86-15285**

**THE AUTONOMOUS HELICOPTER SYSTEM**

J. F. GILMORE (Georgia Institute of Technology, Atlanta) IN: Applications of artificial intelligence; Proceedings of the Meeting, Arlington, VA, May 3, 4, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 146-152. refs

This paper describes an autonomous airborne vehicle being developed at the Georgia Tech Engineering Experiment Station. The Autonomous Helicopter System (AHS) is a multimission system consisting of three distinct sections: vision, planning and control. Vision provides the local and global scene analysis which is symbolically represented and passed to planning as the initial route planning constraints. Planning generates a task dependent path for the vehicle to traverse which assures maximum mission system success as well as safety. Control validates the path and either executes the given route or feeds back to previous sections in order to resolve conflicts. Author

**A86-15341**

**EC-135 FIBER OPTIC TECHNOLOGY REVIEW**

J. R. SCHULTZ and H. N. HODGES (TRW, Inc., Engineering Office, Albuquerque, NM) IN: Fiber optics in adverse environments II; Proceedings of the Meeting, San Diego, CA, August 22-24, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 70-76. refs

(Contract DAEA18-81-G-0068)

The present paper is concerned with a fiber optic technology study for EC-135 Airborne Command Post aircraft application. This study had the objective to determine the feasibility of using fiber optic technology on the EC-135. Advantages of fiber optic technology over conventional technology are related to cost and weight savings, EMP and EMI immunity, electromagnetic compatibility, high data rates, and improved hardness maintenance. The motivation for this study was provided by the possibility that fiber optic technology could reduce the hardness maintenance difficulties for nuclear hardened EC-135 systems. Attention is given to the nuclear threat to the EC-135, aspects of nuclear hardening, and the reasons for considering fiber optic technology. G.R.

**A86-15600**

**DAMAGED RUNWAY OPTIONS EXPLORED**

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 5, Nov. 1985, p. 28-32.

A comparative evaluation is conducted of several concepts that have been proposed for the facilitation of aircraft takeoffs and landings on damaged airfields. Two of these rely on the air cushion effect: one, already implemented and tested in the 1970s on a Buffalo cargo aircraft, integrates the hovercraft-like inflatable hardware directly with the aircraft fuselage, while the other, still undergoing conceptual development, is a separate structure employed for takeoffs exclusively. Two other alternatives involve tank tread-like landing gears for landing and 'ski-jump' ramps for takeoff. The latter has been tested for the case of F/A-18 aircraft. O.C.

**A86-16096**

**ARMY VTOL RESEARCH AND DEVELOPMENT - THE FIRST CENTURY**

R. B. LEWIS, II (ITT Corp., Defense Space Group, Nutley, NJ) Vertiflite (ISSN 0042-4455), vol. 31, Nov.-Dec. 1985, p. 34-38.

The U.S. Army first expressed interest in VTOL aircraft in the form of balloons during the Civil War. Active engineering studies of helicopters began in 1918 and the first helicopter flight was recorded in 1922. Autorotation and mechanical cyclic pitch were demonstrated in 1923 and Congressional approval of development funds was obtained in 1938. The first Sikorsky helicopter was commissioned in 1939 and featured four rotors, one the main lifting rotor. Cyclic blade pitch eliminated two of the rotors. The Army retained responsibility for helicopter development after the Air Force was established, and by 1956 also gained procurement specifications authority, which led to a large order for OH-6A four-blade light observation helicopters in 1964. The LHX is the

next design goal for the Army and the helicopter industry.

**A SURVEY OF AERONAUTICAL STRUCTURAL RESEARCH IN AUSTRALIA**
F. H. HOOKE Dec. 1984 45 p
(AD-A157211; ARL/STRUC-TM-394) Avail: NTIS HC A03/MF A01 CSCL 01C

A survey of Aeronautical structural research in Australia has spanned over more than 40 years, from the establishment of the C.S.I.R. Division of Aeronautics in 1939. Industry, civil aviation and the armed services have benefited from the expertise of Structures Division in problem solving, as well as from ad-hoc research and, perhaps less immediately, from basic research. Not every avenue has been able to be explored. A major subject of research, structural fatigue, arose from an accident in 1945, and each new development in design and material has brought new problems. Standards of safety and risk have been explored. New technology of fiber composites permits better tailoring of strength and stiffness to requirements: this and the introduction to aircraft of active controls offer benefits and problems for the future.

**ASSESSMENT OF AERODYNAMIC AND DYNAMIC MODELS IN A COMPREHENSIVE ANALYSIS**
W. JOHNSON Oct. 1985 39 p refs
(NASA-TM-86835; REPT-85047; NAS 1.15:86835) Avail: NTIS HC A03/MF A01 CSCL 01B

The history, status, and lessons of a comprehensive analysis for rotorcraft are reviewed. The development, features, and capabilities of the analysis are summarized, including the aerodynamic and dynamic models that were used. Examples of correlation of the computational results with experimental data are given, extensions of the analysis for research in several topics of helicopter technology are discussed, and the experiences of outside users are summarized. Finally, the required capabilities and approach for the next comprehensive analysis are described.

**ATR 42 PRODUCTION WORK IN FRENCH, ITALIAN PLANTS DETAILED**
*In its* West Europe Rept.: Sci. and Technol. (JPRS-WST-85-031) p 14-19 8 Nov. 1985 Repr. from Rev. Aerospatiale (France), Oct. 1985 p 16; 18; 20; 22; 27
Avail: NTIS HC A03/MF A01

The ATR-42 passenger aircraft is to be a product of real international cooperation. The Franco-Italian aircraft is to be produced and assembled at three plants in France and one in Italy, with engines supplied by Pratt and Whitney of Canada. The composite wing tips, control surfaces and fairings will be manufactured at Aerospatiale in Nantes. Assembly, integration, and testing of the wing are to be subsequently carried out at the Aerospatiale plant in Sainte Nazaire. The engine nacelles are to be produced by Aerospatiale Meaulte. Manufacturing the fuselage and tail assembly will be the responsibility of Aeritalia in Naples, and final assembly will take place at Aerospatiale's Toulouse plant. Production of the larger version, the ATR-72, will be similarly apportioned.

**HYPERSONIC FLOW PAST NON-SLENDER WEDGES, CONES AND OGIVES IN OSCILLATION**
K. GHOSH (Indian Institute of Technology, Kanpur, India), M. VEMPATI, and D. DAS Aeronautical Journal (ISSN 0001-9240), vol. 89, Aug.-Sept. 1985, p. 247-256. refs

Ghosh's (1977) large-deflection hypersonic similitude and consequent plane and conico annular piston theories have been applied to obtain unsteady pressure and the pitching moment derivatives for oscillating nonslender wedges, cones and ogives. The plane piston theory for a wedge is extended from a quasi-steady analysis, which gives the moment derivative due to pitch rate Cm(q), to an unsteady analysis; the two analyses combine to give the moment derivative due to incidence rate CM (alpha), which is shown here to be the same for wedges and quasi-wedges. The present theory can separately give Cm(q) and CM(alpha) for a quasi-wedge of arbitrary shape; this principle is illustrated for a particular quasi-wedge, namely the parabolic arc plane ogive. In comparison, a previous theory by Hui (1969) gave only the sum of Cm(q) and Cm(theta), only for wedges. The conico annular piston theory is employed to obtain Cm(theta), which is the moment derivative due to a steady pitch angle, and Cm(q) for nonslender cones and axisymmetric ogives in closed form for the first time.

**AERODYNAMICS - THE ROLE OF THE COMPUTER**
G. J. HANCOCK (Queen Mary College, London, England) Aeronautical Journal (ISSN 0001-9240), vol. 89, Aug.-Sept. 1985, p. 269-279. refs

The use of computers in aerospace aerodynamics is reviewed. Computational aerodynamics has advanced due to increasing computer speeds, growth in memory capabilities, and architectural improvements. Numerical modelling of physical flows, algorithm development, research and production code development, and evaluation and validation of the codes using computational aerodynamics are described and examples are provided. The application of computational aerodynamics in aerodynamic design is discussed. In experimental aerodynamics computers are useful in rig automation, data acquistion and synthesis, the design of test facilities, and the specification of test procedures. The interaction between control systems and aerodynamics is studied. The extraction of aerodynamic information from flight tests with computers is discussed.

**NUMERICAL ANALYSIS OF FULLY THREE-DIMENSIONAL PERIODIC FLOWS THROUGH A TURBINE STAGE**
M. KOYA (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan) and S. KOTAKE (Tokyo, University, Japan) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 945-952. refs
(ASME PAPER 85-GT-57)

Fully three-dimensional periodic flows through a turbine stage of stator and rotor are studied numerically by solving time-dependent three-dimensional Euler equations with the finite-volume method. The phase relation of stator and rotor flows and the related blade-row interaction are accounted for in the time-space domain. The established method of numerical calculation makes a practical contribution to predict actual turbine flows through a turbine stage of stator and rotor which have an arbitrary number of blades. ### SECONDARY FLOWS AND LOSSES DOWNSTREAM OF A TURBINE CASCADE

J. MOORE and R. Y. ADHYE (Virginia Polytechnic Institute and State University, Blacksburg) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 961-968. Research supported by the Rolls-Royce, Ltd. refs
(ASME PAPER 85-GT-64)

The loss mechanisms and the behavior of secondary flows downstream of a large scale, linear turbine cascade have been investigated experimentally. A five-blade replica of the cascade used by Langston et al. at United Technologies Research Center was used for the present tests. Detailed flow measurements, using five-hole and three-hole probes, were made at four different planes, one just upstream of the trailing edge and the rest downstream. The secondary flow field at each measurement plane was found to be dominated by a single large passage vortex, which decayed in strength because of the mixing occurring in the flow. More than one-third of the losses were found to occur downstream of the trailing edge. This rise in total pressure loss in the present tests was almost entirely explained by a corresponding dissipation of the secondary kinetic energy of the flow. A mixing analysis of the flow was done to predict the additional losses due to 'mixing' until the flow became completely uniform. Author

### PERFORMANCE EVALUATION OF LINEAR TURBINE CASCADES USING THREE-DIMENSIONAL VISCOUS FLOW CALCULATIONS

J. MOORE and J. G. MOORE (Virginia Polytechnic Institute and State University, Blacksburg) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 969-975. Research supported by the Rolls-Royce, Ltd. refs
(ASME PAPER 85-G-65)

The overall performance of two geometrically similar linear turbine cascades is calculated using an elliptic flow program. The increase in the mass-averaged total pressure loss is calculated within and downstream of the cascades and the results show good agreement with the measured values. The buildup and decay of the secondary kinetic energy are also shown; measurements are available for one of the cascades near and downstream of the trailing edge and these are in close agreement with the calculated values. Details of the flow development are also compared with measurements. Calculated velocity vectors near the endwall show the overturning revealed by surface flow visualization and similarly near the suction surface the strong spanwise flow is well calculated. Calculated contours of total pressure loss in cross-sectional planes confirm the important interaction of the passage vortex with the profile boundary layer at midspan. Regions of high loss near midspan are calculated downstream of both cascades; this three-dimensional flow development is followed in the calculations. Author

### EFFECTS OF TIP ENDWALL CONTOURING ON THE THREE-DIMENSIONAL FLOW FIELD IN AN ANNULAR TURBINE NOZZLE GUIDE VANE. I - EXPERIMENTAL INVESTIGATION

E. BOLETIS (Institut von Karman de Dynamique des Fluides, Rhode-Saint-Genese, Belgium) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 983-990. refs
(ASME PAPER 85-GT-71)

Tip endwall contouring is one of the most effective methods for improving the performance of low aspect ratio turbine vanes. In view of the wide variety of geometric parameters, it appears that only the physical understanding of the three-dimensional flow field will allow evaluation of the probable benefits of a particular endwall contouring. The paper describes the experimental investigation of the three-dimensional flow through a low speed, low aspect ratio, high turning annular turbine nozzle guide vane with meridional tip endwall contouring. The full impact of the effects of tip contouring is evaluated by comparison with the results of a previous study in an annular turbine nozzle guide vane of the same blade and cascade geometry with cylindrical endwalls. In parallel, the present experimental study provides a fully three-dimensional test case for comparison with advanced theoretical calculation methods. The flow is explored by means of double-head, four-hole pressure probes in five axial planes from far upstream to downstream of the blade row. The results are presented in the form of contour plots and spanwise pitch-averaged distributions. Author

### SIMULATION OF THE EFFECTS OF SHOCK WAVE PASSING ON A TURBINE ROTOR BLADE

D. J. DOORLY and M. L. G. OLDFIELD (Oxford University, England) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 998-1006. Research supported by the Rolls-Royce, Ltd. and SERC. refs
(ASME PAPER 85-GT-112)

The unsteady effects of shock waves and wakes shed by the nozzle guide vane row on the flow over a downstream turbine rotor have been simulated in a transient cascade tunnel. At conditions representative of engine flow, both wakes and shock waves are shown to cause transient turbulent patches to develop in an otherwise laminar (suction-surface) boundary layer. The simulation technique employed, coupled with very high-frequency heat transfer and pressure measurements, and flow visualization, allowed the transition initiated by isolated wakes and shock waves to be studied in detail. On the profile tested, the comparatively weak shock waves considered do not produce significant effects by direct shock-boundary layer interaction. Instead, the shock initiates a leading edge separation, which subsequently collapses, leaving a turbulent patch that is convected downstream. Effects of combined wakeand shock wave-passing at high frequency are also reported. Author

### CALCULATION OF FLOWS IN TWO- AND THREE-DIMENSIONAL NOZZLES BY AN APPROXIMATE FACTORIZATION METHOD [RASCHET TECHENII V DVUMERNYKH I PROSTRANSTVENNYKH SOPLAKH METODOM PRIBLIZHENNOI FAKTORIZATSII]

M. IA. IVANOV and V. V. KORETSKII Zhurnal Vychislitel'noi Matematiki i Matematicheskoi Fiziki (ISSN 0044-4669), vol. 25, Sept. 1985, p. 1365-1381. In Russian. refs

An efficient approximate factorization procedure has been developed for calculating steady-state mixed subsonic, transonic, and supersonic potential flows in two- and three-dimensional nozzles. The method is based on the numerical integration of the full equation for the velocity potential written in divergent form and provides a second order of approximation. The advantages of the approach proposed here over other approximate factorization and relaxation methods and finite-difference schemes are demonstrated. V.L.

**A MARCHING EXPLICIT-IMPLICIT PROCEDURE FOR CALCULATING SUPERSONIC FLOW PAST BODIES [MARSHEVYI IAVNO-NEIAVNYI METOD RASCHETA SVERKHZVUKOVOGO OBTEKANIIA TEL]**

N. V. POGORELOV and IU. D. SHEVELEV Zhurnal Vychislitel'noi Matematiki i Matematicheskoi Fiziki (ISSN 0044-4669), vol. 25, Sept. 1985, p. 1391-1400. In Russian. refs

A second-order hybrid, two-step, explicit-implicit finite difference scheme is applied to a marching procedure for calculating supersonic flow of an ideal gas past blunt bodies on the basis of a system of equations written in the form of conservation laws. Each step of the procedure consists of two half-steps; during the first half-step, a solution is sought using an explicit scheme with one-sided differences, while during the second half-step, the finite-difference equations are transformed to an implicit form. A bidiagonal block system of equations is solved at each implicit step; when the Courant condition is satisfied, the implicit steps automatically disappear, and the scheme becomes explicit. V.L.

**THE LINEAR THEORY OF A PROFILE IN A COMPRESSIBLE GAS WITH ADDITIONAL JET FLOW [LINEINAIA TEORIIA PROFILIA V SZHIMAEMOM GAZE PRI DOPOLNITEL'NOM OBDUVE STRUEI]**

G. A. PAVLOVETS TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 1-11. In Russian. refs

The problem of a profile in a compressible gas with additional compressed-gas jet flow is analyzed in the context of linear theory, and expressions are obtained for flow velocities at the jet boundaries and for the boundary shape. For an arbitrary profile, the problem is reduced to that of solving a singular integral equation. Expressions are presented which illustrate the effect of various parameters of the jet and external flow on the lifting force of the profile. It is shown that the problem of jet flow of an ideal compressible gas past a profile can be reduced to an identical problem for an ideal incompressible liquid with somewhat different flow parameters. V.L.

**A86-13352**

**SYMMETRIC TRANSONIC FLOW PAST WINGS OF LARGE ASPECT RATIOS [O SIMMETRICHNOM OBTEKANII TRANSZVUKOVYM POTOKOM KRYL'EV BOL'SHOGO UDLINENIIA]**

IU. B. LIFSHITS and A. M. SOROKIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 12-18. In Russian. refs

A study is made of the applicability of approximate similarity laws established through an analysis of the first terms of a potential expansion in a small parameter that is the reciprocal of the wing aspect ratio. For this purpose, symmetric flow past straight and swept wings is analyzed numerically for various free-stream Mach numbers, aspect ratios, and swep angles. The numerical data obtained, along with an analysis of the initial equations and equations for the terms of the asymptotic expansion, make it possible to determine the nature of the dependence of the aerodynamic characteristics on the problem parameters and also to explain a discrepancy between the numerical and analytical data. V.L.

**A STUDY OF FLOW NEAR A SHOCK WAVE INTERSECTION LINE [ISSLEDOVANIE TECHENIIA V OKRESTNOSTI LINII PERESECHENIIA SKACHKOV UPLOTNENIIA]**

V. V. KELDYSH TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 19-30. In Russian. refs

An analysis is made of three-dimensional flow in the vicinity of the intersection of two shock waves. A region of changes in the governing parameters is identified where the problem has two solutions. For the region where the problem has only one solution, a solution to the problem of the intersection of three incoming shock waves exists. It is also shown that lambda-shaped shock waves are a particular case of the same problem, with one of the waves near the intersection line degenerated to a Mach wave. V.L.

**A86-13354**

**THE EFFECT OF THE INCALCULABLE FLOW REGIME OF AIR SCOOPS ON FLOW PAST A WING [VLIIANIE NERASCHETOROGO REZHIMA RABOTY VOZDUKHOZABORNIKOV NA OBTEKANIE KRYLA]**

B. G. PIANZIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 31-39. In Russian. refs

The problem of the effect of the incalculable flow regime of wing air scoops on flow past the wing is investigated in the context of the existing linear vortex theory of a profile and a wing with an air scoop (Shurygin, 1980, 1981). In particular, the effect of air scoop flow rate distribution on the aerodynamic characteristics of the wing is analyzed numerically. Numerical calculations for wings of different shapes and air scoops of different lengths provide qualitatively consistent results. V.L.

**A86-13358**

**SELECTING THE PRINCIPAL PARAMETERS OF A WEDGE-PROFILED WING [VYBOR OSNOVNYKH PARAMETROV KRYLA S LAMBDA-OBRAZNYM POPERECHNYM SECHENIEM]**

G. I. MAIKAPAR and A. I. PIATNOVA TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 104-109. In Russian. refs

Graphs are presented for determining the aerodynamic characteristics of a wedge-profiled wing of a specified volume for supersonic velocities. The graphs provide a way to select the geometrical parameters of a wing with allowance for additional constraints. It is shown that for a length less than optimum, part of the volume should be located over the leeside of the wing, and an oblique section can be used to reduce the wake drag. V.L.

**A86-13359**

**AERODYNAMIC CHARACTERISTICS OF A FINITE-ASPECT-RATIO WING IN HYPERSONIC FLOW OF A RADIATING GAS [AERODINAMICHESKIE KHARAKTERISTIKI KRYLA KONECHNOGO RAZMAKHA V GIPERZVUKOVOM POTOKE IZLUCHAIUSHCHEGO GAZA]**

V. N. GOLUBKIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 115-120. In Russian. refs

The problem of hypersonic flow of a radiating gas past the windward side of a finite-aspect-ratio wing at large angles of attack is solved analytically to a first approximation using the method of a thin shock layer. The wing surface is nearly plane, its leading edge is sharp, and its shape varies with time. The effect of radiation on the shock wave shape, pressure distribution, and aerodynamic coefficients is examined. V.L.

**A86-13360**

**FLOW OF A DIATOMIC RAREFIED GAS AROUND A CONE [OBTEKANIE KONUSA DVUKHATOMNYM RAZREZHENNYM GAZOM]**

S. L. GORELOV and A. I. EROFEEV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 125-128. In Russian. refs

The problem of hypersonic flow of a diatomic rarefied gas around a cone with half-angles of 10 and 15 deg is solved using the Monte Carlo method. Calculations are carried out for two values of the temperature factor, 1 and 0.1. The results obtained are compared with similar calculations for a monoatomic gas and with experimental data. V.L.

**A86-13363**

**SOME SOLUTIONS TO THE KARMAN EQUATION DESCRIBING FLOW PAST THE SALIENT POINTS OF A PROFILE [O NEKOTORYKH RESHENIIAKH URAVNENIIA KARMANA OPISYVAIUSHCHIKH OBTEKANIE TOCHEK IZLOMA PROFILIA]**

V. N. DIESPEROV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 11-19. In Russian. refs

A solution to the Karman equation for flow past a salient point of a profile with a free flow line is obtained for the case where the subsonic generating line is specified by an arbitrary power law. Attention is also given to the case where the curvature of the subsonic generating line of the salient point is determined by the displacement thickness of the boundary layer during its interaction with the Vaglio-Laurin external potential flow. V.L.

**A86-13364**

**CALCULATION OF SUPERSONIC INVISCID FLOW PAST A PLANE AIR INTAKE ELEMENT WITH AN ISOLATED HEAD WAVE [RASCHET SVERKHZVUKOVOGO NEVIAZKOGO OBTEKANIIA ELEMENTA PLOSKOGO VOZDUKHOZABORNIKA S VYDELENNOI GOLOVNOI VOLNOI]**

S. M. BOSNIAKOV, V. V. KOVALENKO, and A. N. MINAILOS TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 20-29. In Russian. refs

A procedure for calculating supersonic flow past complex bodies is presented which uses a second-order finite difference scheme with nonuniform templates and head wave isolation. Numerical solutions are obtained for flow past a wedge-shaped air intake element and for its aerodynamic characteristics. The flow fields are analyzed, and the results are compared with experimental data and results obtained by using McCormack's first-order finite-difference scheme. V.L.

**A86-13373**

**A JOINT ANALYSIS OF THE BOUNDARY LAYER AND INVISCID FLOW AROUND THE AXISYMMETRIC REAR SECTION OF A FUSELAGE [SOVMESTNYI RASCHET POGRANICHNOGO SLOIA I NEVIAZKOGO POTOKA, OBTEKAIUSHCHEGO OSESIMMETRICHNUIU KORMOVUIU CHAST' FIUZELIAZHA]**

N. L. EFREMOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 119-124. In Russian. refs

Transonic flow past a body of the fuselage or engine nacelle type is analyzed, with allowance made for flow viscosity in terms of turbulent boundary layer theory. Inviscid flow is calculated using Godunov's finite difference scheme, and a joint solution is obtained by using an iteration procedure. To ensure the convergence of iterations, a relaxation (damping) procedure is used for calculating Mach number distributions at the inviscid flow boundary and the boundary layer displacement thickness on the basis of previous iterations. The approach proposed here is illustrated by an example. V.L.

**A86-13374**

**A NUMERICAL ANALYSIS OF THE CHARACTERISTICS OF A TOLLMIEN-SCHLICHTING WAVE PACKET IN A BOUNDARY LAYER ON A FLAT PLATE [CHISLENNYI ANALIZ KHARAKTERISTIK PAKETA VOLN TOLLMINA-SHLIKHTINGA V POGRANICHNOM SLOE NA PLOSKOI PLASTINE]**

A. M. TUMIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 125-127. In Russian. refs

The characteristics of Tollmien-Schlichting wave packets in a boundary layer on a flat plate are calculated for various Mach numbers using a software set developed for calculating the stability of boundary layers in a compressible gas. In all examples, the Prandtl number is 0.72, the stagnation temperature is 310 K, and the specific heat ratio is 1.41. An analysis of the results obtained shows that the development of instability waves in a packet differs substantially from the development of monochromatic perturbations. Results are presented in graphical form and compared with those obtained by the envelope method. V.L.

**A86-13375**

**PROFILING OF SUPERSONIC DUCTS WITH SPECIFIED NONISENTROPIC PARAMETERS AT THE EXIT [O PROFILIROVANII SVERKHZVUKOVYKH KANALOV S ZADANNYMI NEIZOENTROPICHESKIMI PARAMETRAMI NA VYKHODE]**

A. S. VOINOVSKII and V. I. KIREEV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 128-133. In Russian. refs

Plane and axisymmetric supersonic ducts are profiled with a specified distribution of entropy or total pressure at the exit and also with specified Mach and velocity vector angle distributions at the exit and along the profiled duct walls. The specified entropy distribution at the exit is provided by a shock wave at the duct inlet. A duct is designed with Mach 3 at the inlet which ensures a compression and rotation of the flow to Mach 1.05 and a zero velocity vector angle, with varying entropy distributions at the exit. A plane supersonic duct is also designed which simulates vortex flow near the lateral surface of a blunt body in hypersonic flow. V.L.

**A86-13377**

**A NUMERICAL STUDY OF AXISYMMETRIC FLOW PAST A DISK [CHISLENNOE ISSLEDOVANIE OSESIMMETRICHNOGO OBTEKANIIA DISKA]**

V. I. MYSHENKOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 139-144. In Russian. refs

The problem of axisymmetric flow of an ideal viscous heat-conducting gas past a disk is solved numerically using the Navier-Stokes equations for subsonic and supersonic flow velocities (Mach 0.5-3). The formation and evolution of separated flow in the near wake of the disk is investigated for various Mach and Reynolds numbers; changes in the geometrical and gasdynamic parameters of the separated zone are analyzed. Heat fluxes toward the disk surface are determined. V.L.

**A STUDY OF THE NORMAL OF A DELTA-WING AIRCRAFT AT LARGE ANGLES OF ATTAC[illegible]NG UNSTEADY MOTION [ISSLEDOVANIE NORMAL'N[illegible] SILY SAMOLETA S TREUGOL'NYM KRYLOM NA BOL'SHIKH UGLAKH ATAKI PRI NEUSTANOVIVSHEMSIA DVIZHENII]**

IU. A. VINOGRADOV, IU. B. DUBOV, A. N. ZHUK, V. P. MAMROV, and G. I. STOLIAROV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 1-10. In Russian. refs

Results of an experimental study of the normal force of a model of a delta-wing aircraft during unsteady motion at subsonic speeds are reported for a wide range of angles of attack. It is shown that in the case of large angles of attack corresponding to unsteady separated flows, the aerodynamic forces differ essentially from those observed in steady flow. The results of the aerodynamic experiment are compared with flight test data. V.L.

**A86-13380**

**A COMBINED METHOD FOR THE ANALYSIS OF THE AERODYNAMIC FORCES ACTING ON AN OSCILLATING FLIGHT VEHICLE IN SUPERSONIC FLOW [KOMBINIROVANNYI METOD RASCHETA AERODINAMICHESKIKH SIL NA KOLEBLIUSHCHEMSIA LETATEL'NOM APPARATE S SVERKHZVUKOVOM POTOKE]**

V. G. BUNKOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 11-22. In Russian. refs

Aerodynamic forces acting on the system wing-elevator unit in supersonic flow are calculated using the finite element approach. Both the wing and the elevator unit are analyzed using the velocity potential method as the most correct of the known linear methods, the interference between the wing and the elevator unit is analyzed using the acceleration potential method. It is shown that the substitution of a real potential for a complex potential significantly reduces the computation time (from 25 to 5 min for 160 nodes). Substantial savings in computer time and memory are also achieved by dividing the wing into sections with different type of solutions (zero, explicit, real, and complex). The application of the method to flutter analysis is illustrated by two straightforward examples. V.L.

**A86-13381**

### STATISTICAL FORMULATION OF THE OBJECTIVES OF THE AERODYNAMIC EXPERIMENT [STATISTICHESKAIA POSTANOVKA ZADACH AERODINAMICHESKOGO EKSPERIMENTA]

G. L. GRODZOVSKII TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 31-44. In Russian. refs

The principal objective of the aerodynamic experiment is formulated as determining functional relations between the mathematical expectations (and other statistical moments) of the real fluctuating aerodynamic characteristics. On the basis of experimental data on the repeatability of the mean characteristics of the aerodynamic experiment (with similarity criteria observed), the ergodicity principle is established for turbulent flows. It is shown that the finite duration of the aerodynamic experiment leads to errors in determinations of the mathematical expectation of fluctuating aerodynamic characteristics. An adaptive algorithm is proposed for conducting an aerodynamic experiment with a specified stochastic error in minimum time. V.L.

**A86-13389**

### CERTAIN CHARACTERISTICS OF PARACHUTE-WING AERODYNAMICS [NEKOTORYE OSOBENNOSTI AERODINAMIKI PARASHIUTA-KRYLA]

O. P. BRYSOV, E. P. EZEEVA, and IU. G. LIMONAD TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 121-126. In Russian.

The aerodynamic characteristics of parachute-wing models are investigated experimentally at subsonic speeds using the optical method. It is shown that the profile drag of parachutes of the wing type is a factor of 5-10 greater than that of the rigid wing of an aircraft. The probable causes of high profile drag of the parachute wing are examined; the effect of the permeability of the model shell is discussed. V.L.

### PROPAGATION OF SMALL PERTURBATIONS DURING THE INTERACTION OF NONVISCOUS JETS [RASPROSTRANENIE MALYKH VOZMUSHCHENII PRI VZAIMODEISTVII NEVIAZKIKH STRUI]

T. V. TITOVSKAIA TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 127-131. In Russian. refs

The problem of the propagation of small perturbations during the interaction of subsonic and supersonic nonviscous plane jets in a duct with parallel walls is analyzed. The discrete spectra of the true and apparent eigenvalues and eigenfunctions corresponding to the exponentially attenuated and nonattenuated small perturbations are determined numerically. The absence of complex solutions is demonstrated analytically. V.L.

**A86-13391**

### THE EFFECT OF THE BLUNTNESS AND THE HALF-ANGLE OF A CONE ON THE TURBULENT TRANSITION OF A BOUNDARY LAYER AT FREE-STREAM MACH 6 [VLIIANIE ZATUPLENIIA I POLUUGLA RASTVORA KONUSA NA PEREKHOD LAMINARNOGO POGRANICHNOGO SLOIA V TURBULENTNYI PRI CHISLE MACH 6]

A. R. IVANOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 132-135. In Russian.

Experimental data are presented on the effect of the half-angle and bluntness of a cone model on the location of the turbulent transition of the boundary layer at free-stream Mach 6, Re = 2.8 x 10 to the 6th for large angles of attack. It is shown that the bluntness of the model delays the turbulent transition; an increase in the cone half-angle accelerates the transition. On a blunted cone, separated flow is formed at smaller angles of attack than on a sharp cone. V.L.

**A86-13392**

### A METHOD FOR MEASURING THE DIRECTION AND THE MACH NUMBER OF A THREE-DIMENSIONAL SUPERSONIC NOZZLE [K METODIKE IZMERENIIA NAPRAVLENIIA I CHISLA M TREKHMERNOGO SVERKHZVUKOVOGO POTOKA]

M. D. BRODETSKII, G. P. OLKHOVIKOV, A. M. KHARITONOV, A. M. SHEVCHENKO, and S. I. SHPAK TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 136-139. In Russian. refs

A pneumometric technique using five-channel pneumatic nozzles is proposed for the simultaneous measurement of the direction, the Mach number, and the full pressure. The pneumatic nozzles have been calibrated with respect to the pitch and roll angles in the Mach range 2.03-4.05, and a mathematical model of a five-channel pneumatic nozzle has been developed on the basis of the calibration results. Test results for a wedge and a delta-wing model indicate that the angles are determined with an accuracy to within 1 degree and mach numbers to within 4 percent. V.L.

### AN ANALYSIS OF SEPARATED FLOW OF AN IDEAL FLUID PAST A FINITE-ASPECT-RATIO MECHANIZED WING [RASCHET OTRYVNOGO OBTEKANIIA MEKHANIZIROVANNOGO KRYLA KONECHNOGO UDLINENIIA POTOKOM IDEAL'NOI ZHIDKOSTI]

G. G. SUDAKOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 4, 1984, p. 1-6. In Russian. refs

The problem of separated flow of an ideal fluid past a finite-aspect-ratio mechanized wing is solved numerically using the method of matched asymptotic expansions. As an example, aerodynamic characteristics are calculated for a rectangular wing in the presence of separation from the lateral edges. Results are presented in graphical form. V.L.

**A86-13396**

### CONSTRUCTION OF EQUIVALENT PROFILES AND APPROXIMATE CALCULATION OF TRANSONIC FLOW PAST THE ROOT SECTION OF A SWEPT WING [POSTROENIE EKVIVALENTNYKH PROFILEI I PRIBLIZHENNYI RASCHET OKOLOZVUKOVOGO OBTEKANIIA KORNEVOGO SECHENIIA STRELOVIDNOGO KRYLA]

G. A. PAVLOVETS and A. L. SHKADOVA TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 4, 1984, p. 7-14. In Russian. refs

A method is presented for calculating the contour of a profile whose pressrue diagram in plane-parallel flow is identical to that of the root section of a swept wing. These equivalent profiles are used for calculating stress distribution for the root profile of a swept wing for large subsonic flow velocities. The calculated results are compared with experimental data. V.L.

**A86-13397**

### DETERMINATION OF THE SHAPE OF A PROFILE FROM A SPECIFIED CHORD DIAGRAM OF MACH NUMBERS IN TRANSONIC FLOW [OPREDELENIE FORMY PROFILIA PO ZADANNOI KHORDOVOI DIAGRAMME CHISEL MAKHA V TRANSZVUKOVOM POTOKE]

A. A. SHAGAEV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 4, 1984, p. 15-23. In Russian. refs

The method of successive approximations is extended to the case of subsonic and transonic flows of an ideal gas. In particular, attention is given to the inverse problem in the profile theory, and an iteration procedure is presented for solving this problem on the basis of a specified chord diagram of Mach numbers for subsonic and transonic velocities. Results are presented in graphical form. V.L.

**USING THE SHOCK-EXPANSION METHOD FOR CALCULATING THE AERODYNAMIC CHARACTERISTICS OF FLIGHT VEHICLES [PRIMENENIE METODA 'SKACHKOV-RASSHIRENII' DLIA RASCHETA AERODINAMICHESKIKH KHARAKTERISTIK LETATEL'NYKH APPARATOV]**

V. F. SIAGAEV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 4, 1984, p. 24-28. In Russian. refs

The principal relationship of the second-order shock-expansion method is analyzed. A further simplification of this relationship is then proposed, which makes it possible to reduce the time required for the approximate calculation of the aerodynamic characteristics of bodies with nearly linear generatrices. Calculations are carried out for a cone-cylinder combination. V.L.

**A86-13399**

**A STUDY OF HEAT TRANSFER ON WEDGES WITH A SWEPT LEADING EDGE AND A SHARPLY BENT GENERATRIX [ISSLEDOVANIE TEPLOPEREDACHI NA KLIN'IAKH SO SKOSHENNOI PEREDNEI KROMKOI I IZLOMOM OBRAZUIUSHCHEI]**

V. N. BRAZHKO, A. P. KOSYKH, and N. N. SHKIRIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 4, 1984, p. 29-37. In Russian. refs

The aerodynamic and heat transfer characteristics of wedges with various degrees of the leading edge sweep (0-75 deg) and with a sharply bent generatrix are investigated experimentally and analytically for free-stream Mach 4 and 5 and for Re = (7.1-20.7)x10 to the 6th. It is shown that an increase in the leading edge sweep and local roughness of the leading edge lead to a premature turbulent transition of the boundary layer, with the associated maxima of heat transfer coefficients on the wedge surface. The end of the transition region can be located very close to leading edge of the wedge. V.L.

**A86-13406**

**THE EFFECT OF A PERFORATED WALL ON INCOMPRESSIBLE FLOW PAST A U-SHAPED VORTEX [VLIIANIE PERFORIROVANNOI STENKI NA OBTEKANIEI U-OBRAZNOGO VIKHRIA NESZHIMAEMYM POTOKOM]**

A. V. SEMENOV and O. K. CHIKINA TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 4, 1984, p. 99-102. In Russian.

The perturbed velocity potential due to the interaction between a U-shaped vortex and a horizontal or vertical permeable wall in incompressible flow is determined. It is shown that the effect of a permeable wall can be simulated by a simple set of singularities. Corrections for the induction downwash over the span of a U-shaped vortex are calculated for various wall permeability coefficients. V.L.

**A86-13411**

**LINEAR THEORY OF AN EQUIVALENT PROFILE IN THE PROBLEM CONCERNING THE INFLUENCE OF POROUS FLOW BOUNDARIES [LINEINAIA TEORIIA EKVIVALENTNOGO PROFILIA V ZADACHE O VLIIANII PERFORIROVANNYKH GRANITS POTOKA]**

L. G. IVANTEEVA and G. A. PAVLOVETS TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 1-9. In Russian. refs

A solution is obtained for the flow problem for a profile situated in the middle of a channel with porous walls. The analysis is based on a numerical solution of a singular integral equation for the density of the vortex sheet distributed along the chord of the profile. Equivalent-profile theory is used to determine the pressure distribution on a given profile in a channel with porous walls for large subsonic and transonic speeds. B.J.

**A86-13412**

**THE USE OF REVERSE FLOW TO CALCULATE TRANSONIC FLOW PAST BODIES [ISPOL'ZOVANIE OBRASHCHENNOGO POTOKA DLIA RASCHETA OKOLOZVUKOVOGO OBTEKANIIA TEL]**

IU. A. ARUTIUNOV and V. V. VYSHINSKII TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 10-18. In Russian. refs

The reversibility paradox, valid for subcritical transonic flows, is extended to the case of isentropic flow with compression shocks by introducing rarefaction shocks into the reverse flow. It is shown that the same solution can be obtained when calculating the flow in forward and reverse flows. The use of the reverse flow makes possible a two-fold reduction in computational time when implementing transonic-flow computation methods on multiprocessors. B.J.

**A86-13413**

**ASYMPTOTIC SOLUTION OF THE FLUID-FLOW PROBLEM IN THE CORE OF A VORTEX SHEET [ASIMPTOTICHESKOE RESHENIE ZADACHI O TECHENII ZHIDKOSTI V IADRE VIKHREVOI PELENY]**

A. M. GAIFULLIN and A. V. ZUBTSOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 19-29. In Russian. refs

An analysis is made of the flow arising in the core of a vortex sheet due to flow separation from a low-aspect-ratio delta wing at small angles of attack and large Reynolds numbers. An asymptotic solution is obtained on the basis of the complete equations of motion of a viscous incompressible fluid. The asymptotic dependence of flow characteristics in the core of the vortex sheet on alpha, Re, and mean alpha is obtained. B.J.

**A86-13422**

**EFFECT OF CANTILEVERS ON THE LIFT CHARACTERISTICS OF A THIN SWEPT WING AND VORTEX-WAKE STABILITY [VLIIANIE KONSOLEI NA NESUSHCHIE SVOISTVA TONKOGO STRELOVIDNOGO KRYLA I USTOICHIVOST' VIKHREVOGO SLEDA]**

E. P. VIZEL TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 113-118. In Russian. refs

Experimental results indicate that the placement of cantilevers on a delta wing leads to the interaction of vortex sheets separating from the leading edges and the cantilever, and having different degrees of stability. The presence of a leading-edge break point and a reduction in the cantilever sweep leads to an accelerated breakdown of the vortex and a reduction in c(ya)max. B.J.

**A86-13423**

**CALCULATION OF SUPERSONIC FLOW PAST A THREE-DIMENSIONAL CONFIGURATION USING INTEGRAL RELATIONSHIPS [RASCHET SVERKHZVUKOVOGO OBTEKANIIA PROSTRANSTVEN[illegible] KONFIGURATSII S ISPOL'ZOVANIEM INTEGRAL'NYKH SOOTNOSHENII]**

T. V. POGREBNAIA and V. V. SAMSONOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 119-124. In Russian. refs

A numerical method is proposed which can be used to determine the distributed and overall aerodynamic characteristics in supersonic flow past a system of arbitrary surfaces (wings, tail unit, air intake, and the vehicle as a whole) in the framework of the linear approximation. A uniform accuracy of aerodynamic-load determination is assured on all the surfaces. The boundary value problem concerning the determination of surface loads is reduced to a system of integral equations, which are solved by the method of successive approximations. B.J.

**CALCULATION OF FLOW AROUND ROTATING CIRCULAR CASCADES WITH ALLOWANCE FOR CIRCUMFERENTIAL FLOW NONUNIFORMITY INDUCED BY A PERTURBATION AT THE INLET [K RASCHETU OBTEKANIIA VRASHCHAIUSHCHIKHSIA KRUGOVYKH RESHETOK S UCHETOM OKRUZHNOI NERAVNOMERNOSTI POTOKA, VYZVANNOI VOZMUSHCHENIEM NA VKHODE]**

E. S. BELIANOVSKII, V. B. KURZIN, and T. S. SOLOMAKHOVA TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 137-142. In Russian. refs

The method of solution and results are presented for the direct problem concerning the unsteady flow around a rotating circular cascade of thin curved profiles with allowance for circumferential flow nonuniformity induced by a perturbation at the inlet. The perturbation is modeled as a displacement of a vortex source from the center of the cascade. The solution of the integral equation for the circulation intensity on the profiles is obtained by the discrete-vortex method. The effect of cascade parameters and of the displacement magnitude of the vortex source on the circulation intensity on the profiles is analyzed. B.J.

**CERTAIN PROPERTIES OF TWO-DIMENSIONAL FLOWS IN THE CASE OF FLOW PAST BODIES WITH JETS [O NEKOTORYKH SVOISTVAKH PLOSKIKH TECHENII PRI OBTEKANII TEL SO STRUIAMI]**

V. M. SHURYGIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 6, 1984, p. 19-26. In Russian.

Shurygin's (1977) approach is used to study the nonseparated flow, an ideal incompressible fluid past bodies with jets as Be numbers not equal to zero. Representations of the Joukowski functions at an infinitely distant point are given, and formulas for the overall forces acting on the body are presented. A relationship is established between the behavior of the Joukowski functions, the total circulation, and the overall flowrate. B.J.

**A86-13433**

**COMPACT GAS EJECTOR OF A HIGH DEGREE OF COMPRESSION WITH SPIRAL ARRANGEMENT OF THE NOZZLES [KOMPAKTNYI GAZOVYI EZHEKTOR BOL'SHOI STEPENI SZHATIIA S RASPOLOZHENIEM SOPL PO SPIRALI]**

IU. K. ARKADOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 6, 1984, p. 35-42. In Russian. refs

The design is described and experimental results are presented for a compact gas ejector which achieves a high degree of compression (up to 500). The ejector has a single forechamber, a single mixing chamber, and a single regulating element. High-pressure-head gas is fed into the ejector through 45 inclined supersonic nozzles spirally distributed around and along the mixing chamber. Besides exhibiting a high degree of compression, this ejector has 30 percent better cost efficiency than existing multistage ejectors. B.J.

**A86-13440**

**SUPERSONIC GAS FLOW PAST A V-SHAPED WING [OBTEKANIE V-OBRAZNOGO KRYLA SVERKHZVUKOVYM POTOKOM GAZA]**

T. M. PRITULO TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 6, 1984, p. 97-102. In Russian. refs

Pritulo's (1983) method is used to calculate pressure on the surface of a V-shaped wing with supersonic leading edges. On the lower surface of the wing, the flow is linearized with respect to a plane-parallel stream that has passed through a shock attached to the leading edge, the shock is calculated approximately as an isentropic compression. On the upper surface of the wing, the flow is linearized with respect to a plane-parallel stream that has passed through a rarefaction wave. B.J.

**A86-13456**

**AEROHYDROMECHANICS [AEROGIDROMEKHANIKA]**

A. M. MKHITARIAN, ED. Moscow, Izdatel'stvo Mashinostroenie, 1984, 352 p. In Russian. No individual items are abstracted in this volume.

The theoretical fundamentals of aerohydromechanics are examined, with attention given to hydroaerostatics, fluid and gas kinematics, ideal fluid dynamics, similarity and dimensionalities, isentropic flows, shock waves, hydraulic path drag, and boundary layer theory. Various problems in applied aerohydromechanics are then discussed, including wings and airfoils in subsonic, transonic, and supersonic flight, the aerodynamics of bodies of revolution and controls, and the aerodynamic characteristics of an aircraft as a whole. Finally, the discussion focuses on problems in hydraulics, such as calculation of local hydraulic resistance, hydraulic lines, and flows from holes and nozzles. V.L.

**A86-13532**

**BOUNDARY-LAYER DEVELOPMENT ON THE AFTERBODY OF AN ENGINE NACELLE**

E. LAI and L. C. SQUIRE (Cambridge University, England) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 158, Sept. 1985, p. 23-46. Research supported by the Ministry of Defense (Procurement Executive) and Department of Trade and Industry. refs

In the context of the estimation of the drag of a complete aircraft, the calculation of the drag associated with the engine installation presents some particular difficulties. Thus, the nacelle afterbody drag represents a critical area which has been investigated for the past few years. The present paper provides the results of an experimental investigation of the boundary-layer development on a body of revolution with a jet issuing from the base. Detailed boundary-layer measurements were made with a jet velocity of 2.5 times the free-stream velocity. The main effects of replacing a jet by a solid cylindrical sting are discussed. G.R.

**A86-13546#**

**A SOLUTION OF INVERSE PROBLEM FOR MULTI-ELEMENT AEROFOILS THROUGH APPLICATION OF PANEL METHOD**

M. SHIGEMI (National Aerospace Laboratory, Tokyo, Japan) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 28, Aug. 1985, p. 97-107. refs

A solution to the inverse problem of a multielement airfoil is presented. This solution is based on the panel method, in which vortex is chosen as singularity to be distributed around the airfoil. Because of this choice, the solution becomes very simple in comparison with other types of panel methods. To meet the requirements for the solution of inverse problem as a tool to design airfoils, it is possible in this method to obtain an airfoil whose trailing edge is always closed, and the velocity distribution around which is as close to the prescribed one as possible. With a little modification, the present method can give a solution to a problem, which is direct for some elements of a multielement airfoil, but inverse for other elements. This solution is useful when some elements of a multielement airfoil are modified in shape to get a better performance. Author

**A METHOD FOR NUMERICAL ANALYSIS OF THE AERODYNAMIC CHARACTERISTICS OF AN AEROPLANE WING IN THE SUBCRITICAL RANGE OF THE FLYING VELOCITY**

Z. DZYGADLO and T. X. CHU Journal of Technical Physics (ISSN 0324-8313), vol. 25, no. 1, 1984, p. 127-141. refs

A method for determining the aerodynamic characteristics of an aircraft wing making use of a hydrodynamic model composed of discrete vortices is described. Using this method, the coefficients of lift, drag, and transverse force, as well as those of the rolling, pitching, and yawing moments, which act on a wing in incompressible or compressible flow, can be obtained. Here, the circulation flow with attached vortices and separated vortices flowing away from the edges of the wing are studied.Two models of flow are analyzed, with and without leading-edge separation. C.D.

**A STUDY OF THE FLOW AROUND A WING EQUIPPED WITH A SPOILER [CONTRIBUTION A L'ETUDE EXPERIMENTALE ET THEORIQUE DE L'ECOULEMENT AUTOUR D'UN PROFIL D'AILE MUNI D'UN SPOILER]**

B. C. JAEGGY, W. CZICHOWSKY, P. MEYER, G. KOERBER, and R. KAUFFMANN (Saint-Louis, Institut Franco-Allemand de Recherches, France) L'Aeronautique et L'Astronautique (ISSN 0001-9275), no. 112, 1985, p. 2-20. In French. refs
(Contract DRET-82-318; DRET-84-047)

Laser velocimetry and flow visualization data were analyzed for flow around a wing equipped with a spoiler. Two- and three-dimensional velocity data were collected and photographs were taken of the flow seeded with dense oil smoke and illumined by a laser beam and a stroboscope. Attention was focused on the unsteady wake characteristics, the turbulent structures and length scales, the velocity profiles, the Reynolds stress and the pressure distributions. The data were analyzed using the nonviscous model of Maskew and Dvorak (1979). The results demonstrate the feasibility of examining separated flows using laser velocimetry and minimal computing power. Studies of the flows past a spoiler will require further trials, however, particularly for the Re stress. M.S.K.

**A86-14359**

**UNSTEADY POTENTIAL FLOW FOR OSCILLATING AIRFOILS**

I. PARASCHIVOIU (Montreal, Universite, Montreal, Canada) and J.-M. PARROUFFE Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, June 1985, p. 142-158. refs

Attention is given to the development status of an aerodynamic model for the unsteady potential flow about a blade profile, which would be applicable in calculations of the forces acting on Darrieus wind turbine rotor blades. The technique applied to unsteady potential flow distributes elementary singularities uniformly over the profile surface, as well as local singularities in the wake. Such parameters as pressure distribution, lift coefficient, moment coefficient, and time-dependent variations of the wake, are thereby calculated for various profile motions. The model has been validated for symmetrical profiles (undergoing pitching) whose maximum incidence does not exceed the static stall angle. O.C.

**A NEW FAST SOLVER PROCEDURE APPLIED TO THE BGK COMPUTER PROGRAM FOR TRANSONIC FLOW PAST AN AEROFOIL**

Y. S. WONG (Alberta, University, Edmonton, Canada) and D. J. JONES (National Aeronautical Establishment, Ottawa) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, June 1985, p. 159-169. refs
(Contract NSERC-U-0375)

A fast iterative procedure has been developed for calculating the nonconservative full potential transonic flow equation. The numerical method consists of two level iterations: the outer iterate is based on a Newton-like algorithm, and the inner iterate is based on a preconditioned minimal residual method. This method has been tested on the computer program for transonic flow past an aerofoil, originally developed by Bauer, Garabedian and Korn (1972) and often referred to as the 'BGK' code. Computational results from the present method are compared with results from a previous fast solver due to Jameson (1974). The comparison for different Mach numbers and angles of attack is very good in the inviscid case, and reasonably good in the viscous case in which Green's (1973) boundary layer method is used. The present method, howver, gives a reduction in computing time of 40 percent in inviscid calculations, while in the viscous case savings of about 25 percent can be achieved in computer time. Author

**A86-14432#**

**EVALUATION OF A METHOD FOR ANALYZING THE APERTURE REGION OF TWO-DIMENSIONAL EXTERNAL COMPRESSION INLETS**

A. F. CAMPBELL and C. K. FORESTER (Boeing Military Airplane Co., Seattle, WA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. refs
(AIAA PAPER 85-3072)

A two-dimensional Navier-Stokes code is used to compute the flow field in the aperture region of a two-dimensional external compression inlet. The goals of the study are to first establish the ability of the code to correctly predict the relative performance characteristics of previously tested aperture region designs and then use the code as a tool to derive additional design information for optimizing external compression inlet performance. Progress on the validation of the two-dimensional Navier-Stokes procedure is reported. Analytical results are compared with experimental data for one aperture region geometry. The influence of numerical smoothing and cross stream grid resolution on solution accuracy is investigated. Author

**A86-14451#**

**VISCOUS FLOW RESULTS FOR THE VORTEX-AIRFOIL INTERACTION PROBLEM**

J. C. WU, T. M. HSU, W. TANG, and L. N. SANKAR (Georgia Institute of Technology, Atlanta) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. USAF-Army-supported research. refs
(AIAA PAPER 85-4053)

The unsteady airfoil-vortex interaction problem is analyzed using two solution procedures. In the first procedure, the unsteady, incompressible Navier-Stokes equations are solved in the vorticity-stream function form using an integro-differential formulation. In the second approach, the compressible Navier-Stokes equations are solved using an Alternating Direction Implicit (ADI) procedure. Both the approaches use a body-fitted coordinate system. The effects of turbulence are modeled using a two-layer eddy viscosity model. Numerical results are presented for the interaction of a passing vortex with a NACA 0012 airfoil and a NACA 64A006 airfoil for a wide range of flow parameters and compared with available numerical data. Author

### THE EFFICIENT SIMULATION OF SEPARATED THREE-DIMENSIONAL VISCOUS FLOWS USING THE BOUNDARY-LAYER EQUATIONS

W. R. VAN DALSEM and J. L. STEGER (NASA, Ames Research Center, Moffett Field, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. refs
(AIAA PAPER 85-4064)

A simple and computationally efficient algorithm for solving the unsteady three-dimensional boundary-layer equations in the time-accurate or relaxation mode is presented. Results of the new algorithm are shown to be in quantitative agreement with detailed experimental data for flow over a swept infinite wing. The separated flow over a 6:1 ellipsoid at angle of attack, and the transonic flow over a finite-wing with shock-induced 'mushroom' separation are also computed and compared with available experimental data. It is concluded that complex, separated, three-dimensional viscous layers can be economically and routinely computed using a time-relaxation boundary-layer algorithm. Author

**A86-14453#**

### UNSTEADY AERODYNAMICS OF AIRFOILS OSCILLATING IN AND OUT OF DYNAMIC STALL

C. M. WANG, J. C. WU, and L. N. SANKAR (Georgia Institute of Technology, Atlanta) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. Army-supported research. refs
(AIAA PAPER 85-4078)

A solution procedure is presented for the computation of dynamic stall phenomena encountered by arbitrary shaped airfoils under arbitrary flow conditions. This procedure solves the unsteady, incompressible Navier-Stokes and the unsteady boundary layer equations using an efficient, zonal approach. A number of results for a modified NACA 0012 airfoil experiencing dynamic stall are presented and compared with available numerical data. Qualitative comparisons with flow visualization experiments are also presented. The present study also illustrates the effect of numerical viscosity on the accuracy and robustness of the solution procedure. Author

### JUNCTURE FLOW CONTROL USING LEADING-EDGE FILLETS

L. R. KUBENDRAN and W. D. HARVEY (NASA, Langley Research Center, Hampton, VA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 6 p. Research supported by the National Research Council and NASA. refs
(AIAA PAPER 85-4097)

Flow measurements have been made in the wake region of a simulated wing-fuselage juncture, with and without leading-edge fillets, in order to assess the effect of leading-edge modifications on the flow field around the juncture. Preliminary results indicate that there is some reduction in juncture drag at moderate angles of attack with the use of leading-edge fillets. There is also evidence of improvement in the flow characteristics on the surface downstream of the juncture when fillets are used. As the fillet size is increased, flow characteristics start deteriorating at some point, and an optimum fillet size may be required to achieve an overall improvement in the flow field. Author

### COMPUTATION OF ROTOR BLADE FLOWS USING THE EULER EQUATIONS

B. E. WAKE, N. L. SANKAR, and S. G. LEKOUDIS (Georgia Institute of Technology, Atlanta) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. Army-supported research. refs
(AIAA PAPER 85-5010)

The Euler equations are used to compute steady and unsteady three-dimensional transonic flows around nonlifting rotor blades. A hybrid numerical procedure is used that treats the spanwise derivatives explicitly and the other spatial derivatives implicitly. The steady state results are in excellent agreement with results obtained from the full potential equation. The results for unsteady flow compare well with measurements. These results demonstrate the ability of the Euler solver to compute transonic flow around helicopter blades. Author

**A86-14456#**

### SOLUTION OF TRANSONIC FLOW PAST ROTOR BLADES USING THE CONSERVATIVE FULL POTENTIAL EQUATION

L. N. SANKAR (Georgia Institute of Technology, Atlanta) and D. PRICHARD (McDonnell Douglas Helicopter Co., Culver City, CA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 11 p. Research supported by the McDonnell Douglas Helicopter Co. refs
(AIAA PAPER 85-5012)

A solution procedure is presented for the prediction of unsteady, transonic flow past helicopter rotor blades in forward flight. This procedure solves the three-dimensional, unsteady, compressible full potential equation in conservation form in a body-fitted coordinate system using a Strongly Implicit Procedure (SIP). It is assumed that the structure of the unsteady wake, as well as the structural deformation of the rotor blade due to the aerodynamic loads are known independently from a free wake-aeroelastic analysis. These effects are accounted for as corrections to the section angle of attack at several radial stations. Numerical results are presented for a number of rotor configurations in forward flight, and compared with available experimental data. Author

### VELOCITY MEASUREMENTS IN THE NEAR FIELD OF A ROTOR BLADE IN HOVER

N. M. KOMERATH, T. L. THOMPSON, and R. B. GRAY (Georgia Institute of Technology, Atlanta) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 13 p. refs
(Contract DAAG29-82-K-0094)
(AIAA PAPER 85-5013)

Measurements of the velocity field close to a model rotor blade in hover are described. The flow around the tip of the blade has been emphasized in determining the measurement grid. A large data base has been constructed for quantitative comparison with predictions. The data has been used to construct qualitative pictures of the instantaneous flow field in several planes parallel and normal to the blade planform. Selected plots of velocity components measured during the passage of the blade have also been presented for quantitative comparison with prediction techniques. Preliminary comparison of the spanwise distribution of circulation with computed values is shown. The data shows the roll-up of the velocity field around the tip into a tip vortex and the flow patterns on planes above and below the blade. Predicted results are seen to be in good agreement with the measured values at inboard stations, but more work is seen to be necessary for better prediction of the flow around the tip. Sources of possible error in the measurement are discussed. Author

A. ICHIKAWA (Civil Aviation College, Miyazaki, Japan) Journal of Aircraft (ISSN 0021-8669), vol. 22, Nov. 1985, p. 1008-1012. refs

An improved numerical method is developed for calculating the load distributions on oscillating swept tapered wings in incompressible flow. The integration domains is transformed into a rectangular domain, and the domain is divided into many chordwise strips. In the strip containing the control point, the proposed method properly accounts for Cauchy and logarithmic singularities. The solutions generally compared well with other lifting-surface theories, but with much smaller computational times. Author

**MEASUREMENT OF THE HETEROGENEOUS RECOMBINATION PROBABILITY OF OXYGEN ATOMS IN THE COURSE OF SUPERSONIC DISSOCIATED GAS FLOW INTERACTION WITH SOLID BODY SURFACES**
V. D. BERKUT, V. V. KOVTUN, N. N. KUDRIAVTSEV, S. S. NOVIKOV, and A. I. SHAROVATOV (AN SSSR, Institut Khimicheskoi Fiziki, Moscow, USSR) International Communications in Heat and Mass Transfer (ISSN 0735-1933), vol. 12, Sept.-Oct. 1985, p. 567-575. refs

A method for determining time-resolved heterogeneous recombination probabilities of oxygen atoms is described. This technique is based on the comparison of the measured and calculated heat fluxes to a flat wedge-like plate set at a small expansion angle to a supersonic dissociated gas flow with pressure of 100 mm Hg, temperature 3000-4000 K, and velocity of 2.5-3.0 km/sec. The relationship between incident shock wave Mach numbers and full dissociation of oxygen and the absence of gas recombination in the boundary layer is analyzed. The calculation of the relative fraction of the recombination of heat flux using a new heat transfer gauge technique is examined. This gauge technique, which is dependent on the surface reaction Damkohler number produces higher fractions of the recombination of heat fluxes than the previous gauge method. Experimental procedures and results revealing the applicability of this method for calculating recombination probabilities are provided. I.F.

**EXPERIMENTAL STUDY OF GAS FLOW AROUND BLUNT OBJECTS**
A. P. BEDIN, G. I. MISHIN, and M. V. CHISTIAKOVA (AN SSSR, Fiziko-Tekhnicheskii Institut, Leningrad, USSR) (Zhurnal Tekhnicheskoi Fiziki, vol. 55, Apr. 1985, p. 719-722) Soviet Physics - Technical Physics (ISSN 0038-5662), vol. 30, April 1985, p. 423-425. Translation. refs

The effects the physical properties of a gas have on the flow around segmented and conical objects were studied experimentally using ballistic models in air, argon and Freon-12. Air trials were carried out at ambient pressure while the pressures of the other gases were altered to maintain an Re of 650,000 at Mach numbers from 0.5-4 in Ar (and air) and from 1-9 in Freon-12. The flows were monitored in separated and attached regions and in the near wake. The rotation angle of the flow about the apex increased with decreases in the specific heat ratio (SHR), and was associated with expansion of the area of attached flow on the lateral surface. A relationship was observed between critical angle for separation and the Mach number in all gases. Any decrease in the SHR was accompanied by a decrease in the size of the detached flow region. M.S.K.

**MEASUREMENTS IN THE TURBULENT BOUNDARY LAYER ON AN 'INFINITE' SWEPT WING**
P. BRADSHAW and N. S. PONTIKOS (Imperial College of Science and Technology, London, England) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 159, Oct. 1985, p. 105-130. refs

The present paper is concerned with turbulence measurements on an 'infinite' swept wing, simulated by a duct attached to a blower tunnel. The work considered represents an extension of studies reported by van den Berg et al. (1975) and Elsenaar and Boelsma (1974). The current work shows in greater detail that the influence of mean-flow three-dimensionality on the dimensionless structure parameters of the turbulence is more extensive and more subtle than assumed in present calculation methods, which concentrate on the lag in direction of the shear-stress vector while not fully accounting for the decrease in magnitude implied by the experimental results. A few sample results for Reynolds-stress transport normal to the surface are presented. The paper is mainly concerned with the outer layer of the boundary layer. G.R.

**PRESSURE FLUCTUATIONS ON ROTOR BLADES GENERATED BY BLADE-VORTEX INTERACTION**
G. NEUWERTH and R. MUELLER (Aachen, Rheinisch-Westfaelische Technische Hochschule, West Germany) (European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984) Vertica (ISSN 0360-5450), vol. 9, no. 3, 1985, p. 227-239. refs

During some flight operations of helicopters the main rotor blades pass close to or intersect the trailing tip vortices of the main rotor. These blade-vortex interactions (BVI) generate strong fluctuating blade pressures leading to dynamic structural loads and impulsive noise radiation. Currently, accurate load predictions are limited by the lack of knowledge of the tip vortex structure. Therefore, a special test facility was built to investigate the basic mechanism of BVI: a special delta wing generates two leading edge vortices with a structure measured by a five-hole probe. One of these vortices interacts with a rotor which represents the main rotor. The forward flight of the helicopter is simulated by a wind tunnel. By this arrangement a better physical understanding of the BVI can be obtained. Additionally, theoretical methods for computing the local unsteady blade pressures can be checked more reliably. The pressure fluctuations are computed by means of a theory which was derived from the unsteady airfoil theory of Naumann and Yeh. Measured and computed pressure fluctuations are in good agreement. A full span model of a wing/canard concept representing a fighter configuration has been tested at STOL conditions in the NASA Langley 4 x 7 meter tunnel. The results of this test are presented, and comparisons are made to previous data of the same configuration tested as a semispan model. The potential of the propulsive wing/canard to develop very high lift coefficients was investigated with several nozzle spans (nozzle aspect ratios). Although longitudinal trim was not accomplished with the blowing distributions and configurations tested, the propulsive wing/canard appears to offer an approach to managing the large negative pitching moments associated with trailing edge flap blowing. Also presented are data showing the effects of large flap deflections and relative wing/canard positions. Presented in the appendix to the report are limited lateral-directional and ground effects data, as well as wing downwash measurements. Author

(NASA-TM-85705; NAS 1.15:85705) Avail: NTIS HC A02/MF A01 CSCL 01A

Calculations were made of the effects of surface waviness on the external pressure of a supercritical airfoil at design conditions. Wave parameters varied include amplitude, wavelength, phase, and number of cycles. Effects of single and multiple waves are calculated at various chordwise locations. General trends of surface waviness effects on pressure distribution are determined and these solutions are reported. Contour deviations are imposed on the upper surface of the airfoil. Results are presented in a manner designed to facilitate ready comparison with the ideal contour static pressure distribution. Author

The growing application of computational aerodynamics to nonlinear helicopter problems is outlined, with particular emphasis on several recent quasi-two-dimensional examples that used the thin-layer Navier-Stokes equations and an eddy-viscosity model to approximate turbulence. Rotor blade section characteristics can now be calculated accurately over a wide range of transonic flow conditions. However, a finite-difference simulation of the complete flow field about a helicopter in forward flight is not currently feasible, despite the impressive progress that is being made in both two and three dimensions. The principal limitations are today's computer speeds and memories, algorithm and solution methods, grid generation, vortex modeling, structural and aerodynamic coupling, and a shortage of engineers who are skilled in both computational fluid dynamics and helicopter aerodynamics and dynamics. Author

A new interacting boundary layer approach for computing the viscous transonic flow over airfoils is described. The theory includes a complete treatment of viscous interaction effects induced by the wake and accounts for normal pressure gradient effects across the boundary layer near trailing edges. The method is based on systematic expansions of the full Reynolds equation of turbulent flow in the limit of Reynolds numbers, Reynolds infinity. Procedures are developed for incorporating the local trailing edge solution into the numerical solution of the coupled full potential and integral boundary layer equations. Although the theory is strictly applicable to airfoils with cusped or nearly cusped trailing edges and to turbulent boundary layers that remain fully attached to the airfoil surface, the method was successfully applied to more general airfoils and to flows with small separation zones. Comparisons of theoretical solutions with wind tunnel data indicate the present method can accurately predict the section characteristics of airfoils including the absolute levels of drag. E.A.K.

**EFFECTS OF VELOCITY PROFILE AND INCLINATION ON DUAL-JET-INDUCED PRESSURES ON A FLAT PLATE IN A CROSSWIND**
A. L. JAKUBOWSKI, J. A. SCHETZ, C. L. MOORE, and R. JOAG Oct. 1985 52 p refs
(Contract NAG2-256)
(NASA-CR-177361; NAS 1.26:177361) Avail: NTIS HC A04/MF A01 CSCL 01A

An experimental study was conducted to determine surface pressure distributions on a flat plate with dual subsonic, circular jets exhausting from the surface into a crossflow. The jets were arranged in both side-by-side and tandem configurations and were injected at 90 deg and 60 deg angles to the plate, with jet-to-crossflow velocity ratio of 2.2 and 4. The major objective of the study was to determine the effect of a nonuniform (vs uniform) jet velocity profile, simulating the exhaust of a turbo-fan engine. Nonuniform jets with a high-velocity outer annulus and a low-velocity core induced stronger negative pressure fields than uniform jets with the same mass flow rate. However, nondimensional lift losses (lift loss/jet thrust lift) due to such nonuniform jets were lower than lift losses due to uniform jets. Changing the injection angle from 90 deg to 60 deg resulted in moderate (for tandem jets) to significant (for side-by-side jets) increases in the induced negative pressures, even though the surface area influenced by the jets tended to reduce as the angle decreased. Jets arranged in the side-by-side configuration led to significant jet-induced lift losses exceeding, in some cases, lift losses reported for single jets. B.W.

**A METHOD FOR CALCULATING FLOW FIELDS AROUND MOVING BODIES**
S. OGAWA and T. ISHIGURO May 1985 23 p refs
(NAL-TR-859T; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

A new method for calculating flow fields with arbitrarily moving boundaries is proposed. Under the concept of Lie derivative, field equation moving coordinates are derived. There are several kinds of such equations; an exmaple is one written in Viviand's conservative form. According to the formulation presented, it is natural and reasonable to consider that the computation coordinates fitted to the body move in space. This is the reverse of the usual computational procedures. The two dimensional incompressible Navier-Stokes equations in general moving coordinates are solved by a finite difference method. Using the third-order upwind scheme (Kawamura scheme), the present calculations are made for the dynamic stall process on an oscillating airfoil, and the flow generated by a moving cylinder. Consequently it is shown that the flow generated by a moving body can easily be analyzed by the present method. Author

(Contract NAS2-11555)
(NASA-CR-177385; NAS 1.26:177385; TN-85-7104-306-23)
Avail: NTIS HC A04/MF A01 CSCL 01A

The PLTTER graphics system, which is part of CDDMS is discussed. CDDMS is a comprehensive system for data basing and subsequent plotting of data acquired during wind tunnel tests or from computational flow analyses. The PLTTER is a system which creates report-quality plots of data which is stored on a CDDMS data base. The Requests file system allows plot-controlling information to be arranged in the way which is most appropriate for any application. The PLTTER system features many capabilities which are especially useful when plotting wind tunnel data. The PLTTER offers a variety of page formats, different grid options and parametric curve fitting algorithms, and a powerful legend capability to identify relavant information about individual curves. One or more plots on a page can be suppressed if desired so that an established page format can be maintained. Final plot output may be standard Versatec plots, QMS Laser printer plots, or microfiche. E.A.K.

**ON APPLICATIONS OF CHIMERA GRID SCHEMES TO STORE SEPARATION**
F. C. COUGHERTY, J. A. BENEK (Calspan Field Services, Arnold Air Force Station, Tenn.), and J. L. STEGER Oct. 1985 14 p refs
(NASA-TM-88193; REPT-86045; NAS 1.15:88193) Avail: NTIS HC A02/MF A01 CSCL 01A

A finite difference scheme which uses multiple overset meshes to simulate the aerodynamics of aircraft/store interaction and store separation is described. In this chimera, or multiple mesh, scheme, a complex configuration is mapped using a major grid about the main component of the configuration, and minor overset meshes are used to map each additional component such as a store. As a first step in modeling the aerodynamics of store separation, two dimensional inviscid flow calculations were carried out in which one of the minor meshes is allowed to move with respect to the major grid. Solutions of calibrated two dimensional problems indicate that allowing one mesh to move with respect to another does not adversely affect the time accuracy of an unsteady solution. Steady, inviscid three dimensional computations demonstrate the capability to simulate complex configurations, including closely packed multiple bodies. Author

(Contract NCC1-68)
(NASA-CR-174202; NAS 1.26:174202) Avail: NTIS HC A03/MF A01 CSCL 01A

The flow field is simulated on the surface of a given delta wing (Butler wing) at zero incident in a uniform stream. The simulation is done by integrating a set of flow field equations. This set of equations governs the unsteady, viscous, compressible, heat conducting flow of an ideal gas. The equations are written in curvilinear coordinates so that the wing surface is represented accurately. These equations are solved by the finite difference method, and results obtained for high-speed freestream conditions are compared with theoretical and experimental results. In this study, the Navier-Stokes equations are solved numerically. These equations are unsteady, compressible, viscous, and three-dimensional without neglecting any terms. The time dependency of the governing equations allows the solution to progress naturally for an arbitrary initial initial guess to an asymptotic steady state, if one exists. The equations are transformed from physical coordinates to the computational coordinates, allowing the solution of the governing equations in a rectangular parallel-piped domain. The equations are solved by the MacCormack time-split technique which is vectorized and programmed to run on the CDC VPS 32 computer. Author

**AN INVESTIGATION INTO THE VERTICAL AXIS CONTROL POWER REQUIREMENTS FOR LANDING VTOL TYPE AIRCRAFT ONBOARD NONAVIATION SHIPS IN VARIOUS SEA STATES**
M. E. STEVENS and J. ROSKAM Jul. 1985 216 p
(Contract NCC2-242)
(NASA-CR-176355; NAS 1.26:176355; KU-FRL-623-1) Avail: NTIS HC A10/MF A01 CSCL 01A

The problem of determining the vertical axis control requirements for landing a VTOL aircraft on a moving ship deck in various sea states is examined. Both a fixed-base piloted simulation and a nonpiloted simulation were used to determine the landing performance as influenced by thrust-to-weight ratio, vertical damping, and engine lags. The piloted simulation was run using a fixed-based simulator at Ames Research center. Simplified versions of an existing AV-8A Harrier model and an existing head-up display format were used. The ship model used was that of a DD963 class destroyer. Simplified linear models of the pilot, aircraft, ship motion, and ship air-wake turbulence were developed for the nonpiloted simulation. A unique aspect of the nonpiloted simulation was the development of a model of the piloting strategy used for shipboard landing. This model was refined during the piloted simulation until it provided a reasonably good representation of observed pilot behavior. B.W.

Transonic flow fields about wing geometries are computed using an Euler/Navier-Stokes approach in which the flow field is divided into several zones. The flow field immediately adjacent to the wing surface is resolved with fine grid zones and solved using a Navier-Stokes algorithm. Flow field regions removed from the wing are resolved with less finely clustered grid zones and are solved with an Euler algorithm. Computational issues associated with this zonal approach, including data base management aspects, are discussed. Solutions are obtained that are in good agreement with experiment, including cases with significant wind tunnel wall effects. Additional cases with significant shock induced separation on the upper wing surface are also presented. Author

Computer aided tomography (CAT) provides a means of noninvasively measuring the air density distribution around an aerodynamic model. This technique is global in that a large portion of the flow field can be measured. A test of the applicability of CAT to transonic velocities was studied. A hemispherical-nose cylinder afterbody model was tested at a Mach number of 0.8 with a new laser holographic interferometer at the 2- by 2-Foot Transonic Wind Tunnel. Holograms of the flow field were taken and were reconstructed into interferograms. The fringe distribution (a measure of the local densities) was digitized for subsequent data reduction. A computer program based on the Fourier-transform technique was developed to convert the fringe distribution into three-dimensional densities around the model. Theoretical aerodynamic densities were calculated for evaluating and assessing the accuracy of the data obtained from the tomographic method. Author

**DOUBLE-BRANCHED VORTEX GENERATOR**

E. R. CANTWELL, R. V. WESTPHAL, and R. D. MEHTA (Stanford Univ., Calif.) Nov. 1985 25 p refs
(NASA-TM-88201; REPT-86064; NAS 1.15:88201) Avail: NTIS HC A02/MF A01 CSCL 01A

In order to assess the suitability of using a double branched vortex generator in parametric studies involving vortex interactions, an experimental study of the main vortex and secondary flows produced by a double branched vortex generator was conducted in a 20-by-40 cm indraft wind tunnel. Measurements of the cross flow velocities were made with a five hole pressure probe from which vorticity contours and vortex parameters were derived. The results showed that the optimum configuration consisted of chord extensions with the absence of a centerbody. Author

**GROUND EFFECTS ON V/STOL AND STOL AIRCRAFT: A SURVEY**

R. E. KUHN and J. ESHLEMAN Nov. 1985 27 p refs
(NASA-TM-86825; A-85356; NAS 1.15:86825) Avail: NTIS HC A03/MF A01 CSCL 01A

The flow fields encountered by jet- and fan-powered Vertical/Short Takeoff and Landing (V/STOL) aircraft operating in ground effect are reviewed and their general effects on the aerodynamic characteristics are discussed. The ground effects considered include: (1) the suckdown experienced by a single jet configuration in hover; (2) the fountain flow and additional suckdown experienced by multiple jet configurations in hover; (3) the ground vortex generated by jet and jet flap configurations in short takeoff and landing (STOL) operation and the associated aerodynamic and hot-gas-ingestion effects; and (4) the change in the downwash at the tail due to ground proximity. After over 30 years of research on V/STOL aircraft, the general flow phenomena are well known and, in most areas, the effects of ground proximity can be established or can be determined experimentally. However, there are some anomalies in the current data base which are discussed. Author

**A DIRECT-INVERSE METHOD FOR TRANSONIC AND SEPARATED FLOWS ABOUT AIRFOILS Final Report**

L. A. CARLSON Dec. 1985 80 p refs
(Contract NSG-1174)
(NASA-CR-176403; NAS 1.26:176403; TAMRF-3224-85-12)
Avail: NTIS HC A05/MF A01 CSCL 01A

A direct-inverse technique and computer program called TAMSEP that can be sued for the analysis of the flow about airfoils at subsonic and low transonic freestream velocities is presented. The method is based upon a direct-inverse nonconservative full potential inviscid method, a Thwaites laminar boundary layer technique, and the Barnwell turbulent momentum integral scheme; and it is formulated using Cartesian coordinates. Since the method utilizes inverse boundary conditions in regions of separated flow, it is suitable for predicing the flowfield about airfoils having trailing edge separated flow under high lift conditions. Comparisons with experimental data indicate that the method should be a useful tool for applied aerodynamic analyses. Author

**STUDIES OF THE FLOW FIELD NEAR A NACA 4412 AEROFOIL AT NEARLY MAXIMUM LIFT**

R. C. HASTINGS and B. R. WILLIAMS Dec. 1984 35 p
(AD-A157750; RAE-TM-AERO-2026; DRIC-BR-96009) Avail: NTIS HC A03/MF A01 CSCL 02D

Measurements made at a Mach number of 0.18 and a chord-based Reynolds number of 4.2 x million on a constant-chord model having a NACA 4412 aerofoil section are described and compared with the results of flow field calculations. Both the experimental arrangement and the difficulties initially experienced in achieving an adequate approximation to two-dimensional flow above the wing are briefly outlined. The measurements include static pressure distributions on the wing surface and on the wind tunnel walls above and below the mid-span section of the wing. The main emphasis in the experiment was, however, on defining the development of the upper surface boundary layer through separation (at about 20% chord ahead of the trailing-edge) and on into the wake, making extensive use of laser anemometry. The flow field calculations are the semi-inverse kind in which an inverse momentum-integral treatment of the shear flow, used to avoid difficulties at separation, is coupled to a direct solution of the inviscid flow problem. The main features of the method are outlined. GRA

**RECENT EXPERIENCE IN THE RAE (ROYAL AIRCRAFT ESTABLISHMENT) 5-METRE WIND TUNNEL OF A CHINA CLAY METHOD FOR INDICATING BOUNDARY LAYER TRANSITION**

I. R. M. MOIR Aug. 1984 11 p
(AD-A157943; RAE-TM-AERO-2007; DRIC-BR-94478) Avail: NTIS HC A02/MF A01 CSCL 14B

The china clay method is based on the differential rate of evaporation, beneath laminar and turbulent boundary layers, of a liquid absorbed on a solid spread on the surface. The liquid is chosen to have a similar refractive index to the solid so that the mixture appears to be transparent until evaporation has taken place, when the color of the solid becomes visible. The solid layer consists of china clay powder mixture with certain chemicals to form a lacquer, which is sprayed onto the surface. When dry, this forms a semi-permanent white absorbent film. A suitable liquid sprayed on to this film is absorbed by it, causing it to become transparent. Details of a visual method for indicating boundary layer transition are given, with particular reference to tests at high Reynolds number in the RAE 5-meter pressurized low-speed wind tunnel on a slender-body model. The method is compared with other techniques on the basis of ease of use and quality of the indication. GRA

**STUDY OF THE INFLUENCE OF AN OSCILLATING SPOILER ON THE SURROUNDING AERODYNAMIC FIELD [ETUDE DE L'INFLUENCE D'UNE PROTUBERANCE DE PAROI OSCILLANTE SUR LE CHAMP AERODYNAMIQUE ENVIRONNANT]**
O. RODRIGUEZ and J. M. DESSE 12 Nov. 1984 69 p refs In FRENCH
(Contract DRET-83-250)
(IMFL-3119) Avail: NTIS HC A04/MF A01

Transonic wind tunnel tests were carried out on a wall protuberance vibrating with sinudoidal oscillations. The experiments studied spoiler efficiency. The unsteady phenomena following the sinusoidal excitation were studied by ultrafast visualization and by unsteady pressure measurement on the obstacle. The free stream Mach number was 0.5. Spectrum analysis proves the nonlinear nature of the flow. The dimension of the separated flow region varies with the position of the spoiler on the body. The results show that at the frequences considered the response to the oscillations can be studied in steady flow tests. Author (ESA)

**PRESSURE-DISTRIBUTION MEASUREMENTS ON A TRANSONIC LOW-ASPECT RATIO WING**
E. R. KEENER Sep. 1985 77 p refs
(NASA-TM-86683; REPT-85131; NAS 1.15:86683) Avail: NTIS HC A05/MF A01 CSCL 01A

Experimental surface pressure distributions and oil flow photographs are presented for a 0.90 m semispan model of NASA/Lockheed Wing C, a generic transonic, supercritical, low aspect ratio, highly 3-dimensional configuration. This wing was tested at the design angle of attack of 5 deg over a Mach number range from 0.25 to 0.96, and a Reynolds number range from 3.4 x 1,000,000 to 10 x 1,000,000. Pressures were measured with both the tunnel floor and ceiling suction slots open for most of the tests but taped closed for some tests to simulate solid walls. A comparison is made with the measured pressures from a small model in high Reynolds number facility and with predicted pressures using two three dimesional, transonic full potential flow wing codes: design code FLO22 (nonconservative) and TWING code (conservative). At the given design condition, a small region of flow separation occurred. At a Mach number of 0.82 the flow was unseparated and the surface flow angles were less than 10 deg, indicating that the boundary layer flow was not 3-D. Evidence indicate that wings that are optimized for mild shock waves and mild pressure recovery gradients generally have small 3-D boundary layer flow at design conditions for unseparated flow. **ICE SHAPES AND THE RESULTING DRAG INCREASE FOR A NACA 0012 AIRFOIL**
W. OLSEN, R. SHAW, and J. NEWTON (NASA, Lewis Research Center, Cleveland, OH) AIAA, Aerospace Sciences Meeting, 22nd, Reno, NV, Jan. 9-12, 1984. 30 p. Previously announced in STAR as N85-27839. refs
(AIAA PAPER 84-0109)

Experimental measurements of the ice shapes and resulting drag increases were measured in the NASA-Lewis Icing Research Tunnel. The measurements were made over a large range of conditions (e.g., airspeed and temperature, drop size and liquid water content of the cloud, and the angle of attack of the airfoil). The measured drag increase did not agree with the existing correlation. Additional results were given which are helpful in understanding the ice structure and the way it forms, and in improving the ice accretion modeling theories. There are data on the ice surface roughness, on the effect of the ice shape on the local droplet catch, and on the relative importance of various parts of the ice shape on the drag increase. Experimental repeatability is also discussed. Author

**RESPONSE DETERMINATION OF PROPELLER TO BIRD STRIKE USING HIGH SPEED PHOTOGRAPHY**
R. S. BERTKE (Dayton, University, OH) and R. L. EDINGER (TRW, Inc., Hartzell Propeller Products Div., Piqua, OH) IN: High speed photography, videography, and photonics II; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 4-8.

Static bench type impact tests of 4.0 and 1.5 pound artificial birds striking the leading edge of composite propeller blades are conducted to determine the damage response of the blades to bird strike. The artificial birds (cylindrical in shape) are launched at velocities up to 900 ft/sec (275 m/sec) to demonstrate that composite construction propeller blades will pass the Federal Aviation Administration (FAA) bird strike requirements. A high speed framing camera is used to determine the impact velocity of the birds, maximum tip deflections, bird/blade contact time, and the elapsed time required to achieve maximum deflection. **G PROTECTION BY AN EXTREME CROUCH POSITION Phase Report, 1 Aug. 1983 - 1 Sep. 1984**
H. J. VONBECKH 4 Sep. 1984 14 p
(Contract NR PROJ. F58-523)
(AD-A157081; NADC-84162-60) Avail: NTIS HC A02/MF A01 CSCL 06S

In World War II the pilots of diving bombers tolerated high G loads by assuming a crouch position. The Dynamic Flight Simulator (Human Centrifuge) was used to prove the advantages of the crouch position. Two subjects were located in an extreme crouch position, the upper spine being at an angle of 80 to 90 degrees from the vertical. They tolerated 6.5 and 7.5 G respectively. Both subjects have tolerated only 3.5 G in former experiments when seated upright. The use of an Anti-G suit did not improve further G tolerance. Both subjects abandoned the experiment not because of the Loss of Vision, but because of the discomfort of overfilling of the facial area with blood. It is planned to find a crouch position where the vision is still maintained and the blood filling of the facial area is mitigated. This would probably be a crouch position of 45 to 60 degrees from the vertical. Author (GRA)

**AIRCRAFT INTERIOR PANEL TEST CRITERIA DERIVED FROM FULL-SCALE FIRE TESTS Final Report**
R. G. HILL, T. I. EKLUND, and C. P. SARKOS Sep. 1985 65 p refs Original contains color illustrations
(FAA/CT-85/23) Avail: NTIS HC A04/MF A01

Full scale cabin fire tests were conducted to determine potential increases in passenger survivability associated with different interior honeycomb panel constructions. The test fuselage was a C-133 with a simulated wide body door opening exposed to an 8 foot by 10 foot fuel fire. In the first series, the interior near the door was lined with the honeycomb panels to determine whether earlier studies performed with small scale enclosures were consistent with the full scale counterpart. These earlier studies resulted in the selection of the Ohio State University (OSU) Rate of Heat Release Apparatus as the most appropriate type test to evaluate aircraft panels. The first series was followed by tests that included fire blocked seats and carpeting as well as the panels to determine the type survivability increases that could be attained from low heat release materials. The scenario employed generally resulted with flashover within 2 minutes for panels considered typical in performance. A low heat release phenolic/fiberglass panel demonstrated a flashover delay until about 4 minutes into the test. An incombustible panel prevented flashover altogether. The performance of the various panels was evaluated to develop recommended flammability criteria for a modified OSU Rate of Heat Release Apparatus. Author

**FAA (FEDERAL AVIATION ADMINISTRATION) COULD IMPROVE OVERALL AVIATION SAFETY AND REDUCE COSTS ASSOCIATED WITH AIRPORT INSTRUMENT LANDING SYSTEMS**
3 Apr. 1985 50 p
(PB85-195444; GAO/RCED-85-24; B-215115) Avail: NTIS HC A03/MF A01 CSCL 01E

The Federal Aviation Administration (FAA) operates and maintains over 700 instrument landing systems at airports throughout the United States. The Government Accounting Office (GAO) found that FAA could save about $31 million between now and the year 2000 if it replaced some of its older instrument landing systems with newer systems, which are less costly to operate. GAO also found that FAA could improve overall aviation safety and reduce cost by ensuring that existing systems are located where they are needed most. GRA

**ADVANCED EMERGENCY OPENINGS FOR COMMERCIAL AIRCRAFT**
L. J. BEMENT and M. L. SCHIMMEL Nov. 1985 18 p refs Presented at the 30th Corporate Aviation Safety Seminar, Dallas, Texas, 14-16 Apr. 1985
(NASA-TM-87580; L-16012; NAS 1.15:87580) Avail: NTIS HC A02/MF A01 CSCL 01C

Explosively actuated openings in composite panels are proposed to enhance passenger survivability within commercial aircraft by providing improvements in emergency openings, fuselage venting, and fuel dump. The concept is to embed a tiny, highly stable explosive cord in the periphery of a load-carrying composite panel; on initiation of the cord, the panel is fractured to create a well-defined opening. The panel would be installed in the sides of the fuselage for passenger egress, in the top of the fuselage for smoke venting, and in the bottoms of the fuel cells for fuel dump. Described are the concerns with the use of explosive systems, safety improvements, advantages, experimental results, and recommended approach to gain acceptance and develop this concept. Author

Sep. 1985 113 p Sponsored by NASA
(NASA-CR-176393; NAS 1.26:176393) Avail: Issuing Activity CSCL 01C

Independent assessments of the provisions taken by NASA to assure the safety of their aviation operations are reported. Aviation operations conducted at the Lewis Research Center (LeRC) are reviewed. These reviews and independent assessments were undertaken as part of an on-going effort to provide NASA management with a qualitative evaluation of the overall organizational structure, administrative policy. A report which provides NASA management with a broad overview of the current status and safety of aviation operations at LeRC is presented. Recommendations for improvements are provided whenever a significant impact on the present level of safety assurance is judged to be feasible, or an existing situation has the potential for creating a hazardous condition. ## AIRCRAFT COMMUNICATIONS AND NAVIGATION

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**A86-12677**
**USING ROLL-ANGLE MEASUREMENTS TO TRACK AIRCRAFT MANEUVERS**
C. C. LEFAS (Ministry of Physical Planning, Housing, and Environment, Athens, Greece) IEEE Transactions on Aerospace and Electronic Systems (ISSN 0018-9251), vol. AES-20, Nov. 1984, p. 672-681. Research supported by Eurocontrol. refs

Present day radar trackers used for air traffic control purposes perform satisfactorily during straight-line flight, but their performance during maneuvers is sometimes degraded. The introduction of the secondary surveillance radar mode S system makes transmission of several airborne measurements to the ground station possible. This paper investigates the use of one such parameter, roll angle, to assist present trackers during maneuvers to achieve accuracies comparable to those achieved during straight-line flight. Author

**CORRELATION OF GPS RECEIVER CHANNEL TRACK CONTINUITY WITH AIRCRAFT STRUCTURAL MASKING**
E. G. BLACKWELL, E. T. FICKAS, and D. Y. RICHARDSON (SRI International, Menlo Park, CA) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 189-197.
(Contract DAEA18-81-G-0062)

A GPS receiver with antennas located in an aircraft-mounted pod will be subject to signal blockage due to masking of the GPS satellite constellation by the aircraft structure. Analysis of aircraft flight test data involving a wing-mounted GPS antenna has shown that most of the receiver's loss-of-lock occurrences can be correlated with the optical shadow of the aircraft. Shadow regions of various tactical aircraft are used to estimate the extent of tracking outages for GPS pod antennas with the full 18-satellite constellation. Author

**A86-13224**
**AN OVER THE HORIZON COMMAND/DATA LINK SYSTEM**
W. C. TURNER (Electro Magnetic Processes, Inc., Chatsworth, CA) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 327-340.

A three channel link, L-band, MDI band, and S-band, over which command, television, and telemetry are transmitted over a 100 mile range is discussed. A general description and diagram of the over the horizon command/data link system utilizing a three channel link is presented. The components and functions of the shore station, aircraft repeater station, and ship's station are described. Range altitude coverage profiles for the shore station and ship's station, revealing the range of each antenna, are provided. Techniques for determining antenna selection and location, and the selection of link transmitter power and system noise figure to achieve a carrier-to-noise ratio of ratio of 12dB or greater are analyzed. Link budgets for two paths of the over-the-horizon relay link are given. Design parameters for an over the horizon microwave link are listed. I.F.

**A86-13225**
**AIRBORNE TELEMETRY - THE ADVANCED RANGE INSTRUMENTATION AIRCRAFT**
L. G. AVERY, JR. (USAF, ARIA Programs Div., Wright-Patterson AFB, OH) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 341-347.

The ARIA which tracks and obtains telemetry data to support lunar missions, orbital vehicles, and ballistic and cruise missiles with nonreal-time and real-time coverage is discussed. The ARIA contains a 30,000 pound modular package of instrumentation subsystems, Prime Mission Electronic Equipment (PMEE). The functions of the antenna, radio frequency, record, timing, communications, and data separation subsystems and the master control console of PMEE are described. Improvements in the PMEE, and cruise missile, Pershing II, and airframe modifications are examined. Proposed modifications to the ARIA fleet include: the use of C-18 airframes; a cruise missile mission control aircraft; an advanced medium-range air-to-air missile; and a sonobuoy missile impact location system. I.F.

**A86-13226**
**AN INTEGRATED SOLUTION FOR FLIGHT TEST DATA HANDLING**
W. E. DUNN (Fairchild Weston Systems, Inc., Sarasota, FL) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 349-362.

An integrated airborne/ground data acquisition and processing system is being implemented for McClellan AFB. This Flight Data Acquisition and Processing System is capable of gathering large amounts of varied types of instrumentation data during F-111 test flights and providing general purpose computer processing of the test data results. A programmable PCM data acquisition system was developed along with companion acquisition systems for monitoring the F-111 SRAM, MARK II, PAVETACK, and MIL-STD-1553 on board computer busses. The information is stored on an IRIG instrumentation recorder for subsequent processing and display by a DEC VAX 11/780 computer in the ground station. The VAX in the ground station is supported by multiple programmable preprocessors for data compression/engineering unit conversion and a specially developed software system provides a unique integration of the airborne/ground system capabilities via a parameter data base. A special capability of the system is the ability to process a typical flight tape utilizing a single playback of the instrumentation tape at the recorded speed. Author

**A86-13227**
**AN EXTENDED PHASE-LOCK TECHNIQUE FOR AIDED ACQUISITION**
S. BARBOUR (Figgie International, Inc., Hartman Systems Div., Huntington Station, NY) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 363-370.

A novel approach is described to extend the threshold for a phase-locked loop designed for a particular telemetry receiver. By phase remodulating the error signal, the network reduces the phase swing of the signal and restores the carrier power so as to provide anti-sideband properties for biphase and PM modulation up to 1.3 radians deviation at all modulation frequencies and at a signal level where CNR is greater than 5 dB above PM threshold. D.H.

**A86-13230**
**THE USE OF TRANSLATORS WITH GPS**
E. E. WESTERFIELD (Johns Hopkins University, Laurel, MD) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 391-396.

An alternative approach is described that can obviate putting expensive receivers onboard expendable platforms to use the Air Force Global Positioning System (GPS) for position and velocity determination. If either a translator or a transdigitizer is used in the vehicle under test, signals transmitted by GPS satellites are received by vehicle antennas, translated to a frequency in the telemetry band, amplified, and transmitted to a receiving station. Specially designed receiving equipment on the ground processes the transmissions from the translator/transdigitizer, tracks the transmissions from each satellite, and makes the measurements necessary to allow computation of the platform position and velocity. Systems concepts are discussed and two current systems - one using a translator in a missile and the other a transdigitizer in a sonobuoy - are described in detail. D.H.

**REQUIREMENTS FOR GYROSCOPES FOR INERTIAL NAVIGATION**
J. D. NUTTALL (Ferranti Defence Systems, Ltd., Edinburgh, Scotland) IEE Proceedings, Part J - Optoelectronics (ISSN 0267-3932), vol. 132, pt. J, no. 5, Oct. 1985, p. 250-254.

Work regarding the fiber-optic rotation sensor is now proceeding at an estimated forty or fifty institutions in the UK, U.S., and Western Europe. Many of the institutions have had no previous experience of rotation sensors (or gyroscopes, as they are traditionally called), while some workers in the field have little idea of the current state-of-the-art of mechanical ('spinning mass') gyros and ring laser gyros (RLGs). It is pointed out that this paper is intended as a briefing for such people, taking into account the performance needed from a gyroscope suitable for use in inertial navigation today. The gimballed and strapdown systems of inertial navigation are discussed along with the use of a gyroscope for north finding, the operation of gyros with and without torquers, requirements on maximum detectable rotation rate, requirements on scale factor accuracy, gyro drift or bias, and some examples of real gyros. **SIMULATION OF THE ENHANCED TRAFFIC ALERT AND COLLISION AVOIDANCE SYSTEM (TCAS 2) Semiannual Report**
R. G. ROJAS, W. D. BURNSIDE, P. LAW, and B. GRANDCHAMP Sep. 1985 86 p refs
(Contract NSG-1498)
(NASA-CR-176328; NAS 1.26:176328; SAR-716199-3) Avail: NTIS HC A05/MF A01 CSCL 17G

The OSU aircraft code is used to analyze and simulate the TCAS 2 circular array which is mounted on the fuselage of a Boeing 737 aircraft. It is shown that the sum and difference patterns radiated by the circular array are distorted by the various structures of the aircraft, i.e., wings, tail, etc. Furthermore, monopulse curves are calculated and plotted for several beam positions and THETA angles. As expected, the worst cases of distortion occur when the beams are pointed toward the tail of the aircraft. Author

**AN ANALYTICAL COMPARISON OF THREE VISUAL APPROACH SLOPE INDICATORS: VASIS, T-VASIS AND PAPI**
J. MILLAR Aug. 1984 56 p refs Original contains color illustrations
(ARL/SYS-R-33; AR-003-963; SR-33) Avail: NTIS HC A04/MF A01

The three Visual Approach Slope Indicators (VASIs), VASIS, T-VASIS and PAPI, approved by the international Civil Aviation Organization (ICAO) for use by turbojet aeroplanes are compared. The discussion is based upon published performance data including approach path measurements and pilot opinion, ergonomics and the ability to fulfill operational requirements. It is concluded from flight trial data and operational experience that T-VASIS is a more precise and sensitive aid than Red-White VASIS which has several deficiencies. The current policy of not using Red-White VASIS for routine operations in Australia is supported by the conclusions. It is predicted that PAPI also will be less satisfactory than T-VASIS. This prediction is based mainly on ergonomic principles. Performance data about PAPI is limited and consists mainly of relatively uninformative pilot acceptance surveys. Because insufficient objective parameters describing trajectories of aircraft from the intended user-population have been published, most of the claims for PAPI superiority remain unsubstantiated. Accordingly, it is recommended that PAPI be evaluated using objective measures in a controlled experimental environment with transport aircraft. Author

(Contract NAS1-17556)
(NASA-CR-177983; NAS 1.26:177983; CSDL-R-1799) Avail: NTIS HC A10/MF A01 CSCL 01C

Three failure detection and identification techniques were compared to determine their usefulness in detecting and isolating failures in an aircraft flight control system; excluding sensor and flight control computer failures. The algorithms considered were the detection filter, the Generalized Likelihood Ratio test and the Orthogonal Series Generalized Likelihood Ratio test. A modification to the basic detection filter is also considered which uses secondary filtering of the residuals to produce unidirectional failure signals. The algorithms were evaluated by testing their ability to detect and isolate control surface failures in a nonlinear simulation of a C-130 aircraft. It was found that failures of some aircraft controls are difficult to distinguish because they have a similar effect on the dynamics of the vehicle. Quantitative measures for evaluating the distinguishability of failures are considered. A system monitoring strategy for implementing the failure detection and identification techniques was considered. This strategy identified the mix of direct measurement of failures versus the computation of failure necessary for implementation of the technology in an aircraft system. Author

**DISCOVERY OF THE KALMAN FILTER AS A PRACTICAL TOOL FOR AEROSPACE AND INDUSTRY**
L. A. MCGEE and S. F. SCHMIDT Nov. 1985 24 p refs
(NASA-TM-86847; REPT-85424; NAS 1.15:86847) Avail: NTIS HC A02/MF A01 CSCL 17G

The sequence of events which led the researchers at Ames Research Center to the early discovery of the Kalman filter shortly after its introduction into the literature is recounted. The scientific breakthroughs and reformulations that were necessary to transform Kalman's work into a useful tool for a specific aerospace application are described. The resulting extended Kalman filter, as it is now known, is often still referred to simply as the Kalman filter. As the filter's use gained in popularity in the scientific community, the problems of implementation on small spaceborne and airborne computers led to a square-root formulation of the filter to overcome numerical difficulties associated with computer word length. The work that led to this new formulation is also discussed, including the first airborne computer implementation and flight test. Since then the applications of the extended and square-root formulations of the Kalman filter have grown rapidly throughout the aerospace industry. Author

(AD-A157944; NAS-SR-1000) Avail: NTIS HC A10/MF A01 CSCL 01E

The NAS System Requirements Specification (NASSRS) is a compilation of requirements which describe the operational capabilities for the National Airspace System (NAS) as the NAS is envisioned to exist by the year 1995. In that context, it includes those existing and transitional capabilities that will also exist in the 1995 system. It is intended primarily for use as an internal FAA management tool to support the NAS design, engineering, and acquisition activities and to manage and control change to the NAS. The document provides a ground-based systems representation of the proposed operational capabilities planned for the NAS. As programs and subsystems are developed and implemented the capabilities they provide will be compared to this document as a measure of success of NAS Plan Implementation. The contents of the document include: overview; flight planning; traffic control and airspace management; monitoring; navigation; air defense and law enforcement surveillance; aircraft detection and identification; communications; maintenance and support: system effectiveness. (AD-A159115; CERL-TR-P-85/13) Avail: NTIS HC A04/MF A01 CSCL 17G

This report documents research conducted to identify problem areas in; the design of existing Type 2 Air Traffic Control Tower (ATCT) installations and to develop standard design criteria to avoid these problems in future installations. Many design problem areas were identified in the ATCT structure's architectural design, substructure, superstructure, roof systems, exterior walls, interior construction, mechanical systems, electrical systems, and air traffic control interfaces. For each of these areas, specific solutions to the problems were recommended. However, incorporation of these solutions must consider a specific site location and environmental conditions. GRA

**F-4 FUNCTIONAL MODERNIZATION**
W. D. POULIN (United Technologies Corp., Government Products Div., West Palm Beach, FL) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 815-820.
(ASME PAPER 85-GT-69)

Attention is given to the F-4 'Super Phantom' as an exemplary case of the functional modernization of an existing aircraft, as an alternative to the more expensive acquisition of new types. The F-4 modernization package considered in the present feasibility study encompasses a novel centerline (conformal) fuel tank, digital avionics, and PW1120 reengining for greater thrust. The reengining, in particular, leads to a 1:1 thrust-to-weight ratio, which is deemed capable of sustaining fighter survivability against threats anticipated through the 1990s. The performance levels obtained are comparable to those of the most recent fighter designs, at less than half the cost. O.C.

**A86-13106**
**STRUCTURAL BONDING WITH POLYSULFIDE ADHESIVE ON B-1B AIRCRAFT**
J. FASOLD (Rockwell International Corp., Columbus, OH) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 461-470.

A novel technique has been developed for the bonding of composite antiicing blankets to directionalizing vanes that are located inside the nacelle ducts of the B-1B aircraft. The selection of the adhesive system was based on the ability of the adhesive to allow removal of the blankets from the vane if necessary, while retaining the bond in the severe load spectrum created by the nacelle inlet's vibroacoustic environment. A 100-percent solids polysulfide adhesive was selected on the basis of trade studies, while structural films and pastes were rejected. O.C.

**THE USE OF AUTOMATED RIVETING SYSTEMS IN AIRCRAFT CONSTRUCTION**

J. MASKOW (Messerschmitt-Boelkow-Blohm GmbH, Hamburg, West Germany) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 855-863.

A riveting system has been developed for spherical surface airframe structures that is fully automated, using an optical sensor which automatically compensates for dimensional variations through adjustment of component tolerances. Also developed is a riveting system for the assembly of clip-to-frame connections which employs a numerically controlled positioner with an optical sensor. These systems facilitate the manufacture of longitudinal joint connections on closed aircraft fuselages. O.C.

**X-29 FLIGHT TESTING**

D. SANGL (Grumman Data Systems Corp., Bethpage, NY) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 139-146.

Attention is given to the methods used to achieve real time flight test monitoring of the NASA X-29 forward swept wing research aircraft, such that flight test analysts and design engineers in Bethpage, NY, were privy to aircraft behavior during flight testing in California. The X-29's telemetry data is PCM at 500 kb/sec, and beamed at a geosynchronous satellite. A transponder channel receives this beam and retransmits it on an antenna that covers most of the U.S. An earth station system at Calverton, NY, receives this signal and regenerates the aircraft PCM signal through a modem. O.C.

**A86-13219**

**TELEMETRY FROM EXPERIMENTAL RESCUE- AND RECOVERY SYSTEMS**

H.-J. KLEWE (DFVLR, Institut fuer Flugmechanik, Brunswick, West Germany) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 217-224. refs

Measuring techniques in rescue and recovery systems are mainly applied to parachute and ejection seat systems. Thereby, the measurements of special interest are forces occurring in the suspension lines of parachutes during inflation; accelerations acting on persons to be rescued or on materials to be recovered; the progress of velocities during the retarding of persons, ejection seats, test vehicles and so on; as well as measurements of the static pressure and possibly the outside temperature for the determination of altitudes. Further, the change of the projected area of a parachute during inflation will also be of interest. The data values are transformed by the transducers to analogue electric signals and telemetered to the ground station. To determine the projected area of the parachute during inflation this event is filmed by a high speed film camera which is installed in the rear of the test vehicle. Furthermore, the entire experiment is filmed from the ground by another high speed camera. On request, a cinetheodolite and a tracking radar installation is used additionally to get data concerning rate of descent and trajectory of the parachute-load system. Author

**THE INFLUENCE OF ADVANCED PROPULSION ON SHORT-TO MEDIUM-RANGE TRANSPORT DESIGN**

G. E. LEDBETTER (Boeing Commercial Airplane Co., Seattle, WA) Aerospace (UK) (ISSN 0305-0831), vol. 12, Oct. 1985, p. 30-32.

The effect of advanced propulsion and improved wings on the design of passenger transport aircraft is examined. A comparison of the effects of bypass ratio on the weight and thrust specific fuel consumption of turbofan and turboprop aircraft with engine cruise thrust of 4000 pounds at M = 0.75 at 3500 ft is presented; the high-speed turboprop is predicted to save 27 percent more fuel than the turbofan. An experiment evaluating the fuel efficiency of six 150-passenger transport aircraft at M = 7.5 at 35,000 ft with a design range of 1700 n mi and wing-mounted or aft-mounted engines, and various wing aspect ratios is described and a graph is provided. The results reveal the improved efficiency of the turboprop over the turbofan for each wing configuration. I.F.

**MODELING REALISTIC ENVIRONMENTAL STRESSES ON EXTERNAL STORES**

H. W. ALLEN (LTV Aerospace and Defense Co., Dallas, TX) Journal of Environmental Sciences (ISSN 0022-0906), vol. 28, Sept.-Oct. 1985, p. 26-33. refs

This paper presents a method for achieving realism required by recent DOD tailoring documents. Use of this approach can be cost-effective for modeling realistic external-store environmental vibration stresses, where no measured data is available. The emphasis presented herein is in tailoring vibration levels to actual mission-defined captive and free-flight profiles. This approach uses a 'maximum predicted environment' derived from the statistical analyses of 1839 random vibration flight data measurements made on six different external stores. The basic vibration data used in these analyses were measured on six different host aircraft under a wide variety of captive flight conditions. In comparison, the MIL-STD-810D calculated qualification test requirement for an aft-half, MER cluster, air-to-air missile, produced a required testing level greater than twice the maximum predicted environment (overall grms level) for an equivalent missile. Author

**A86-13315#**

**STRAIN MEASUREMENT OF THE USB-FLAP STRUCTURES OF NAL STOL AIRCRAFT**

K. EGAWA and M. SANO (National Aerospace Laboratory, Chofu, Japan) IN: International Congress on Experimental Mechanics, 5th, Montreal, Canada, June 10-15, 1984, Proceedings . Brookfield Center, CT, SESA, 1984, p. 236-244. refs

A reversible strain gage was developed for strain measurements in the safety tests of the upper surface blowing type flap structures that are used as high lift devices in new STOL aircraft. The strain gage has a room-temperature curing adhesive on the reverse, allowing it to be used twice, and fulfills the requirements imposed on it by the acoustically excited conditions of the test. In particular, it (1) can be attached at the measuring points without heating to avoid deforming of the test panels, (2) attains more accuracy on the first test run, permitting conductance of one-shot tests, and (3) has high durability. The gage can be used at 150 C for about 110 hours. I.S.

**A86-13368**

**WING STRUCTURE DESIGN FOR MAXIMUM AILERON EFFICIENCY [PROEKTIROVANIE KONSTRUKTSII KRYLA IZ USLOVIIA MAKSIMIZATSII EFFEKTIVNOSTI ELERONOV]**

A. V. SHARANIUK and IU. F. IAREMCHUK TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 82-89. In Russian. refs

The objective of the study is to determine the effect of changes in the stiffness of the wing structure on the efficiency of ailerons. The gradient of the aileron efficiency function is determined by using the method of Lagrangian multipliers. A low-aspect-ratio wing is considered as an example, and the aileron efficiency gradient is calculated from the wing stiffness parameters for a constant total mass of the structure, with constraints imposed on the thickness of the isotropic and orthotropic panels and on the stiffness of the beams. V.L.

**EQUATIONS OF ROLLING FOR A WHEEL WITH AN ELASTIC TIRE [OB URAVNENIIAKH KACHENIIA KOLESA S UPRUGOI SHINOI]**

V. S. GOZDEK TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 90-99. In Russian. refs

The problem of the small oscillations of a rolling wheel with an elastic tire is formulated as a boundary value problem for a partial differential equation. A method is proposed for reducing this problem to a system of ordinary differential equations. A method is also proposed for deriving equations of rolling which approximately allow for the inertia of the deformable tire. V.L.

**A86-13371**

**CHARACTERISTICS OF THE LIFTING PROPERTIES OF AIRCRAFT WITH SWEPTFORWARD WINGS AT SUPERSONIC VELOCITIES [OSOBENNOSTI NESUSHCHIKH SVOISTV SAMOLETOV S KRYL'IAMI OBRATNOI STRELOVIDNOSTI PRI SVERKHZVUKOVYKH SKOROSTIAKH]**

A. A. GLADKOV and R. A. RATNER TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 109-113. In Russian. refs

The lifting force distributions over the elements of schematic aircraft configurations with swept and sweptforward wings are compared for the case of supersonic flow using the panel method. It is shown that the main difference between the two wing configurations consists in the body-wing interference pattern. It is further shown that the difference between the lifting properties of the two types of wings becomes less pronounced with increasing Mach numbers. V.L.

**A86-13421**

**ANALYTICAL METHOD FOR CONSIDERING THE ELASTICITY OF THE BLADES IN THE AERODYNAMIC CALCULATION OF A HELICOPTER PROPELLER [ANALITICHESKII METOD UCHETA UPRUGOSTI LOPASTEI V ZADACHE AERODINAMICHESKOGO RASCHETA NESUSHCHEGO VINTA VERTOLETA]**

V. S. VOZHDAEV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 99-112. In Russian. refs

Approximate analytical solutions of the partial differential equations of the combined bending and torsional vibrations of a propeller blade are obtained along with instantaneous coefficients for the influence of circulations on the vertical displacements and elastic-twist angles of blade elements. These solutions are obtained on the basis of periodic solutions of second-order differential equations, reduced to integral operators transforming the input force excitation into the periodic response of the system. The problem thus becomes one of the aerodynamic calculation of an absolutely rigid propeller with allowance for the effect of elasticity in the influence-function matrix of induced velocities. B.J.

**A86-13437**

**DESIGN OF A MINIMUM-WEIGHT GLIDING WING [PROEKTIROVANIE SKOL'ZIASHCHEGO KRYLA MINIMAL'NOI MASSY]**

N. V. BANICHUK, V. I. BIRIUK, and I. I. KOANDE TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 6, 1984, p. 71-76. In Russian.

The problem of the optimal distribution of the stiffness characteristics over the span of a gliding swept wing is solved according to a minimum-weight criterion. Constraints are imposed on the aerodynamic load-bearing capacity of the wing and on the difference of moments between cantilevers of the wing. The influence of different structural parameters on the optimal solution is examined. B.J.

**A86-13438**

**OPTIMIZATION OF STRUCTURAL LOAD-BEARING DESIGNS USING ANISOTROPIC MODELS ACCORDING TO AEROELASTICITY CONDITIONS [OPTIMIZATSIIA KONSTRUKTIVNO-SILOVYKH SKHEM PRI ISPOL'ZOVANII ANIZOTROPNYKH MODELEI PO USLOVIIAM AEROUPRUGOSTI]**

V. I. BIRIUK and A. V. SHARANIUK TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 6, 1984, p. 77-84. In Russian. refs

The optimization of the structural load-bearing designs of wings according to aeroelasticity conditions using anisotropic models is considered. The wing panels are modeled as an orthotropic plate of variable stiffness; the optimal orientation angle of the anisotropy axes corresponding to the largest of the moduli is determined for this plate under the condition of the maximization of either the efficiency of the transverse-control elements or the critical flutter velocity (or divergence). Examples of the choice of the optimal orientation of the anisotropy axes for swept wings are presented. B.J.

**POWERED-LIFT TECHNOLOGY ON THE THRESHOLD**

W. H. DECKERT and J. A. FRANKLIN (NASA, Ames Research Center, Moffett Field, CA) Aerospace America (ISSN 0740-722X), vol. 23, Nov. 1985, p. 34-38, 40, 42.

A design configuration study and comparative performance evaluation is presented for current and planned V/STOL military aircraft and their powerplant and control systems, with a view to the effect of the operational capabilities uniquely furnished by such aircraft for battlefield tactics. Attention is given to V/STOL naval aircraft and the carrier or ship's deck conditions under which they must be able to operate. Thrust-vectoring and tilt rotor configurations are the most prominent among successful experimental and operational aircraft of this type; cargo aircraft have most often incorporated short/rough airfield operation capabilities rather than full VTOL. A major development thrust has been mounted for a supersonic short takeoff/vertical landing aircraft. O.C.

**7J7 - BOEING SETS THE PACE**
J. MOXON Flight International (ISSN 0015-3710), vol. 128, Oct. 26, 1985, p. 24-28.

Attention is given to novel technologies' incorporation in the B-7J7 150-seat airliner, which is scheduled for delivery in 1992 and will feature the use of contrarotating unducted fan (UDF) powerplants. The UDF is expected to furnish the greater part of the 40-percent fuel efficiency improvement projected for the 7J7. Other advanced technologies will encompass fly-by-wire/fly-by-light controls with a direct optical link between sensors and controllers, a high speed data bus for cockpit, systems and computer communications, and aluminum-lithium alloy and graphite/epoxy primary structures. O.C.

**A86-14423**
**THE 'SUPER ETENDARD' IS ALWAYS OF INTEREST [LE 'SUPER ETENDARD' EST TOUJOURS D'ACTUALITE]**
J. MORISSET and R. NAZARETIAN Air et Cosmos (ISSN 0044-6971), vol. 23, Oct. 12, 1985, p. 21, 23, 24, 29. In French.

Plans are under way to produce another upgraded version of the Super Etendard (SE), which is an evolution of an aircraft first manufactured in 1956. The new versions are targeted for the defense of aircraft carriers. The selling points of the new SE are its recent successes as a low-level, maneuverable transonic attack aircraft. The upgrades include the Atar 8K50 engine for Mach 0.8 flight with over 10,000 lb thrust. Coomparisons of the SE with the new AMX show relative equivalence in many aspects. The SE will receive an advanced avionics system with automated navigation accurate to within 1 nm/hr. The cockpit will include HUD and flight phase controls. Other equipment are FLIR, ECM, and automated target acquisition and tracking. M.S.K.

**A86-14436#**
**AERO/PROPULSION TECHNOLOGY FOR STOL AND MANEUVER**
J. F. MELLO and D. R. KOTANSKY (McDonnell Aircraft Co., St. Louis, MO) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 10 p.
(AIAA PAPER 85-4013)

The expected benefits from the two-dimensional thrust vectoring the thrust reversing (TV/TR) nozzles and canards to be used on a F-16 fighter in a STOL and Maneuvering flight test program are delineated. Nozzle deflection furnishes STOL capabilities and roll, pitch and yaw control for the twin-engined F-15. Internal operations are maximized by controlling the exhaust aperture. TR can furnish up to 67 percent full reverse power in landing phases and in-flight. Dihedral canards increase lift in supersonic flight and provide positive trim, while aerodynamically reacting favorably with the wings, which are twice the length of the canards. The tests are hoped to yield effective design options for future fighter aircraft. M.S.K.

**A86-14449**
**THE DEVELOPMENT OF DYNAMIC PERFORMANCE STANDARDS FOR GENERAL AVIATION AIRCRAFT SEATS**
S. J. SOLTIS (FAA, Washington, DC) and J. W. OLCOTT (Business and Commercial Aviation, White Plains, NY) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 16-19, 1985. 18 p. refs
(SAE PAPER 850853)

Recently, recommendations were furnished to the FAA by the General Aviation Safety Panel (GASP) to encourage the establishment of FAA crash tolerance requirements for new seats for general aviation aircraft carrying less than 10 passengers. The guidelines were based on NASA, FAA and GASP crash test data and mil-spec standards for aircrashworthiness, particularly for the UH-60A helicopter. Analyses were performed of probable causes of accidents, impact velocities and correlations among various types of small aircraft. Impact pulse shapes and durations and survivable limits were quantified. Criteria were defined for the causes of injuries to certain parts of the body to devise standardized testing of new seat designs to determine if the seats offer adequate restraint/protection for passengers. M.S.K.

**A86-14458#**
**STUDIES OF ROTOR-AIRFRAME INTERACTIONS IN FORWARD FLIGHT**
N. M. KOMERATH, H. M. MCMAHON, and J. E. HUBBARTT (Georgia Institute of Technology, Atlanta) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 10 p. refs
(Contract DAAG29-82-K-0094)
(AIAA PAPER 85-5015)

The helicopter rotor and airframe cannot be treated in isolation if significant improvements in forward-flight performance are to be achieved; rotor-airframe interaction effects must be understood and predictable. Results from an experimental/analytical study of this interaction problem are presented and discussed. The experimental results include mean and periodic pressures on the surface of a cylindrical airframe and measured mean velocity components in the rotor wake. An existing prediction code is used to calculate mean pressures and velocity components which are compared with the experimental results. The impingement of the rotor wake on the airframe causes significant effects with regard to both the mean and periodic pressures. These mean effects are not adequately predicted by an available fully-coupled interaction code in its present form. A comprehensive prediction code must include unsteady effects. Author

**A86-14498#**
**THE FUNDAMENTALS OF AIRCRAFT COMBAT SURVIVABILITY ANALYSIS AND DESIGN**
R. E. BALL (U.S. Naval Postgraduate School, Monterey, CA) New York, AIAA, 1985, 410 p. refs

A comprehensive treatment is presented of military aircraft design problems to which the continuing development of antiaircraft weapons gives rise. The discussion encompasses both fixed wing and rotary wing aircraft; all mission types and combat scenarios are treated, under a general organization which distinguishes among vulnerability (due to the position of critical components), susceptibility (likelihood of detection and destruction in a given enemy threat environment), and survivability (active measures taken to ensure minimum detection and destruction probability, including battle damage repair). An attempt is made to anticipate likely developments in enemy sensor technologies and weapon lethality in the near future, as well as to project potentially fruitful aircraft design optimization solutions. O.C.

**FLUTTER AND DIVERGENCE AEROELASTIC CHARACTERISTICS FOR COMPOSITE FORWARD SWEPT CANTILEVERED WING**
I. LOTTATI (Technion - Israel Institute of Technology, Haifa) Journal of Aircraft (ISSN 0021-8669), vol. 22, Nov. 1985, p. 1001-1007. refs

An analytical investigation was conducted to determine the aeroelastic flutter and divergence behavior of a cantilevered, composite, forward swept rectangular wing. The influence due to the variation in the bending-torsion stiffness coupling of the tailored wing on the flutter and divergence critical dynamic pressure is analyzed. The analytical approach utilizes the incompressible two-dimensional unsteady aerodynamic strip theory. Flutter and divergence velocities were obtained by using an optimization procedure that solves exactly the coupled bending-torsion equations for a cantilevered swept wing. The results indicate that

the flutter and divergent of a fixed-root wing involve a compromise, since the bending-torsion stiffness that maximizes the flutter velocity tends to minimize the divergent speed and vice versa.

### THE LAMINAR AIRLINER - PROSPECTS AND PROBLEMS

B. R. A. BURNS (British Aerospace, PLC, Preston, England) Air International (ISSN 0306-5634), vol. 29, Nov. 1985, p. 235-239.

A development history and performance improvement evaluation is presented for various active boundary layer control (BLC) laminarization methods that have been applied to modified and experimental aircraft in order to improve their aerodynamic efficiency and reduce their fuel consumption. Boundary layer suction through slots or holes has been the object of primary interest amon BLC techniques, often in conjunction with exotic airfoil profiles and propulsion system integration configurations. The substantial gains predicted for BLC aircraft on theoretical grounds have often, however, gone unrealized because of the inherent, boundary turbulence-generating presence of aircraft surface imperfections and vibrations, rain and ice impacts on the leading edge, and even the effect of insects that are encountered as swarms at low altitudes. O.C.

### WING ASPECT RATIO OPTIMIZATION RELATED TO PAYLOAD AND TO FUEL CONSUMPTION OF TRANSPORT PROPELLER AIRPLANES

P. A. GILI and F. B. QUAGLIOTTI (Torino, Politecnico, Turin, Italy) Society of Allied Weight Engineers, Annual Conference, 43rd, Atlanta, GA, May 21-23, 1984. 17 p. refs
(SAWE PAPER 1615)

Solutions are obtained relating the range, payload, and fuel consumption of a propeller aircraft as a function of the wing aspect ratio (WAR) and the flight attitude (FA). A simple and reliable formula for predicting the wing weight is proposed and introduced in the flight performance (FP) equations, which express the FP as a function of the WAR only, permitting brief analysis of many design solutions in a large operational field. The analytical results allow drawing of many diagrams for the relations between the payload or fuel consumption and the FA, for optimum values of WAR at different operational ranges. I.S.

### 4 X S = S(ATF)

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 5, Nov. 1985, p. 10-17.

A technology integration and performance forecast is presented for the U.S. Air Force's next-generation Advanced Tactical Fighter (ATF), which will become operational at the turn of the century. The most critical performance improvements envisaged for the ATF are sustained supersonic flight, short field takeoff and landing capabilities, enhanced survivability through the incorporation of stealth features (reducing IR emissions and radar cross section), and enhanced supportability in a combat scenario. Significant acceleration, maneuvering, and thrust reversal (for short landing run) contributions must be made by a 9:1 thrust/weight ratio powerplant that integrally incorporates a thrust vectoring/reversing two-dimensional variable geometry nozzle. O.C.

### DOUGLAS PLANS CONTINUING UPGRADES TO MAINTAIN MD-80 COMPETITIVENESS

K. F. MORDOFF Aviation Week and Space Technology (ISSN 0005-2175), vol. 123, Nov. 11, 1985, p. 52, 57, 59, 61, 65.

A projection is made of configurational possibilities and prospective performance improvements obtainable for the MD-80 family of medium size airliners. The two primary variants foreseen are the MD-87, for the 115-130 seat transport class, which will be derived by a shortening of the MD-80 fuselage, and the 160-seat MD-89, derived by stretching the MD-80. In the longer term, attention is to be given to the incorporation of ultrahigh bypass engines which may be of either propfan or unducted fan type. More extensive primary structural use is planned for carbon/epoxy and kevlar/epoxy composites, and novel carbon or glass fiber-reinforced phenolics will be introduced. O.C.

### AIRBUS INDUSTRIE STRESSES TECHNOLOGY, AVAILABILITY OF A320

J. M. LENOROVITZ Aviation Week and Space Technology (ISSN 0005-2175), vol. 123, Nov. 11, 1985, p. 81, 83, 85.

A performance capability and market viability assessment is made for the state-of-the-art technology A320 airliner, whose total orders and options over the course of 1986 are expected to rise to nearly 300 aircraft. Certification for the A320 is scheduled for 1988, using CFM56-5 engines. The airliner will seat 120-179 passengers, depending on cabin configuration, and it incorporates fly-by-wire controls, pilot/copilot sidestick controllers, a centralized maintenance data system, a novel wing design with automatic load alleviation, and extensive use of composite materials in both primary and secondary structures. The manufacturer has begun to survey prospective customers for the requirements of twin-engine (TA-9) and four-engine (TA-11) wide body airliners. O.C.

### THE V-22 - PREPARING FOR FULL-SCALE DEVELOPMENT

R. J. TRACY (U.S. Naval Air Systems Command, Washington, DC) Vertiflite (ISSN 0042-4455), vol. 31, Nov.-Dec. 1985, p. 27-29.

The V-22 tilt-rotor aircraft must possess a range of over 2000 mi, have rotors under 38 ft diam, and in shipboard basing weigh less than 25 tons. The V-22 is approaching full-scale development after 6000 hr of wind tunnel tests to characterize the configuration, drag, rotor effects, spin behavior, aeroelstic boundaries, the engine nacelle airflow characteristics and methods validation. Longitudinal instability at a low lift coefficient has been eliminated and the scale model results indicate a flutter-free performance at over 420 kt. Some of the design choices, such as the nacelle tilt in hover, have been validated on the XV-15 aircraft. Full-size tests have been performed on the wing structure, which will sport 1200 lb of composite parts. Particular attention is being given to minimizing weight as the design studies progress. M.S.K.

**A86-16097**

### TOMORROW'S FLEET - THE LIGHT HELICTOPER FAMILY (LHX)

R. K. ANDERSON (U.S. Army, Aviation Systems Command, Washington, DC) Vertiflite (ISSN 0042-4455), vol. 31, Nov.-Dec. 1985, p. 42-46.

The development program for the next generation of light rotorcraft has progressed to contracts for the turboshaft engine and the preparation of the RFP for the LHX air vehicle system. The LHX will have two variants: the scout/attack aircraft (SCAT) and light utility (U). Both will be capable of one-person operation, flight in adverse weather and achieve 40-50 percent cost redutions compared to the current fleet. The avionics will be state of the art digital equipment, driven by VHSIC and accepting voice commands. The total procurement will be 5023 aircraft. The program is in the concept exploration stage, and has defined the gross weight interval as 7500-8500 lb and at $6/4 million each for the SCAT/U vehicles. Innovation has been the guideword in defining the LHX specifications, which will only be 40 pages long.

### FEASIBILITY OF SIMPLIFYING COUPLED LAG-FLAP-TORSIONAL MODELS FOR ROTOR BLADE STABILITY IN FORWARD FLIGHT

G. R. NILAKANTAN (Hindustan Aeronautics, Ltd., Bangalore, India) and G. H. GAONKAR (Florida Atlantic University, Boca Raton) (European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984) Vertica (ISSN 0360-5450), vol. 9, no. 3, 1985, p. 241-256. refs

The feasibility of simplifying coupled lag-flap-torsional models is explored for the low-frequency stability of isolated hingeless rotor blades in forward flight. The nonlinear equations of moderate deflections with appropriate geometric nonlinearities are valid to third order, so are the perturbed linear equations about time dependent equilibrium (trim) positions. Aerodynamic strip theory based on a quasisteady approximation of two-dimensional unsteady airfoil theory is used. Under linear and quasilinear propulsive trim conditions, stability is investigated for four cases: a base-line model with elastic lag bending, flap bending and torsion degrees of freedom, the modified elastic lag-flap model that neglects only torsional dynamic effects, and the rigid blade models with and without quasisteady approximation to torsion. The method of equivalent Lock number and drag coefficient is used for qualitative insights into dynamic inflow effects. The range of validity of the modified elastic lag-flap and rigid lag-flap models is outlined with respect to torsional frequencies for soft (including matched stiffness) and stiff inplane rotors. Author

**THE EFFECT OF HIGHER HARMONIC CONTROL (HHC) ON A FOUR-BLADED HINGELESS MODEL ROTOR**

G. LEHMANN (DFVLR, Institut fuer Flugmechanik, Brunswick, West Germany) (European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984) Vertica (ISSN 0360-5450), vol. 9, no. 3, 1985, p. 273-284. refs

A four-bladed hingeless rotor system was used for application of higher harmonic control (HHC) inputs. With the objective of obtaining a better knowledge of the dynamic behavior of rotor forces and moments theoretical and experimental investigations were conducted. Wind tunnel measurements in the DNW with the DFVLR rotor test rig included different advance ratios and trimmed flight conditions scaled down from the BO-105 helicopter. After a brief description of the test equipment, the sensor arrangement, the data acquisition and data reduction, the evaluation of the reference data will be described. In the second part of this contribution the effect of the 3, 4 and 5/rev control inputs to the vibratory hub and blade loads are demonstrated. The major aspect to be discussed is the extraction of nonlinearities and couplings in the control inputs, which are the amplitudes and phases of the three higher harmonic blade pitch angles. Additionally comparisons of the cost functions, used at simulation runs and the wind tunnel tests, are described. The cost function gives a value for the vibration level on the dedicated rotor system which is an input for most of the common HHC algorithms. Author

**EXPERIENCE WITH A NEW APPROACH TO ROTOR AEROELASTICITY**

M. H. PATEL and G. T. S. DONE (City University, London, England) (European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984) Vertica (ISSN 0360-5450), vol. 9, no. 3, 1985, p. 285-294. Research supported by the Ministry of Defence. refs

Experience with an alternative procedure for computing the aeroelastic stability of a helicopter rotor system is described. The method has already been presented at a previous European Rotorcraft Forum, and is aimed at generating the coefficients of the aeroelastic equations of motion automatically on the computer. The main objective of the current work is to validate the associated computer program using three practical examples provided by Westland Helicopters Ltd. These examples are graded such that different aspects of the program are tested. The validation exercise is completed by comparing the results obtained by the new method with those previously obtained using conventional techniques, and providing explanation for discrepancies where they occur. **PNEUMATIC ACTUATOR DEVICE Patent**

R. W. GAZZERA, inventor (to Air Force) 16 Apr. 1985 7 p
Supersedes AD-D009822
(AD-D011794; US-PATENT-4,510,846;
US-PATENT-CLASS-91-460) Avail: US Patent and Trademark Office CSCL 13K

A closed center four-way poppet actuator control device is incorporated into a pneumatic actuation system for controlling the movement of flight surfaces. The closed center four-way poppet actuator control device has a housing, a pair of two-way poppet valves in the housing, a rocker arm assembly mounted on the housing and connected to the pair of two-way poppet valves, and a diaphragm assembly also mounted in the housing and in contact with the two-way valves. A torque motor-driver assembly connected to the diaphragm assembly actuates the two-way valves as determined by control symbols. The rocker arm causes the two-way valves to function opposite each other: one allows high pressure gas to be input to a lobe motor acutator while the other allows gas to be output from the lobe motor actuator. Each two-way valve has a cylindrical poppet valve for inletting the gas to the actuator and a disk poppet valve for outputting the gas from the actuator to a vent. The actuator causes movement of the flight surfaces through a gearbox. A velocity transducer monitors this movement and transmits this movement to an electronic control unit which sends control signals to drive the torque motor-driver assembly that actuates said actuator control device. **THE C-17: WE NEED IT YESTERDAY**

B. R. HOOTEN 25 Apr. 1985 37 p
(AD-A157147) Avail: NTIS HC A03/MF A01 CSCL 01C

This student essay examines the historical development of the C-17, beginning in the 1970's when Tactical Airlift Command was pressing for development of the Advanced Medium Shortfield Takeoff and Landing Transport. An in-depth look is taken at the Congressionally Mandated Mobility Study and at the analyses done by the C-X Task Force that led to the final definition of the C-17. The US Air Force Airlift Master Plan is reviewed to show the importance of the C-17 to the structure of our airlift force of the future. Real world potential applications of the C-17 are projected by examination of two studies of actual airlift operations. AHUAS TARA '83, (a combined operation in Honduras) and URGENT FURY, the US rescue mission to Grenada in October 1983. This essay supports the need to buy the C-17 by showing the detailed, logistical process that led to its design, and by using two recent actual operations to show the airplane's unprecedented airlift capabilities of today and into the foreseeable future. **WINGTIP SAILS TESTED ON Y-5 AIRCRAFT**

Y. DAXI *In its* China Rept.: Sci. and Technol. (JPRS-CST-85-029) p 49-53 3 Sep. 1985 Transl. into ENGLISH from Guoji Hangkong (Beijing), no. 5, May 1985 p 2-3
Avail: NTIS HC A08/MF A01

In recent years, much attention has been given to the use of wingtip ailerons or wing tip sails to reduce induced drag because for most transport airplanes, the induced drag at cruising speed is approximately 30 percent of the total drag; at lower speeds the ratio is even higher. For the Y-5 biplane, the induced drag to total drag ratio is approximately 55.6 percent, at cruising speed the ratio is approximately 33 percent, and during climb it is 58 percent. Therefore, wing tip ailerons or wing tip sails potentially can be very effective in reducing the overall drag of the aircraft. Since a large number of Y-5 airplanes are used in China for a variety of applications, a research program was initiated in August 1982 to install and test wing tip sails on the Y-5 aircraft. Results show that the use of wing tip sails improved the performance of the Y-5 aircraft. Author

### ABRASION BEHAVIOR OF ALUMINUM AND COMPOSITE SKIN COUPONS, STIFFENED SKINS AND STIFFENED PANELS REPRESENTATIVE OF TRANSPORT AIRPLANE STRUCTURES

K. E. JACKSON Nov. 1985 33 p refs
(Contract DA PROJ. 1L1-61102-AH-45)
(NASA-TP-2520; L-16018; NAS 1.60:2520; AVSCOM-TR-85-B-7)
Avail: NTIS HC A03/MF A01 CSCL 01C

A three-phase investigation was conducted to compare the friction and wear response of aluminum and graphite-epoxy composite materials when subjected to loading conditions similar to those experienced by the skin panels on the underside of a transport airplane during an emergency belly landing on a runway surface. The first phase involved a laboratory test which used a standard belt sander to provide the sliding abrasive surface. Small skin-coupon test specimens were abraded over a range of pressures and velocities to determine the effects of these variables on the coefficient of friction and wear rate. The second phase involved abrading I-beam stiffened skins on actual runway surface over the same range of pressures and velocities used in the first phase. In the third phase, large stiffened panels which most closely resembled transport fuelage skin construction were abraded on a runway surface. This report presents results from each phase of the investigation and shows comparisons between the friction and wear behavior of the aluminum and graphite-epoxy composite materials. Author

### TRADEOFF ANALYSIS OF TECHNOLOGY NEEDS FOR PUBLIC SERVICE HELICOPTERS

J. S. BAUCHSPIES, W. R. BRYANT, JR., and W. E. SIMPSON Aug. 1985 120 p refs
(Contract NASW-3554)
(NASA-CR-3927; NAS 1.26:3927; ORI-TR-2459) Avail: NTIS HC A06/MF A01 CSCL 01C

The design requirements for a family or type of Public Service Helicopter (PSH) is examined which will satisfy the needs of municipal and state governments in the following mission areas: Emergency Medical Service--Airborne Rescue Squad; Law Enforcement; Search and Rescue; and Environmental Control (Fire Fighting, Pollution, Resource Management). The report compares both design and performance requirements as specified by the PSH user's group against current technological capabilities, RTOPS and US Army LHX design requirements. The study explores various design trade-offs and options available to the aircraft designer/manufacturer in order to meet the several criteria specified by the PSH user's group. In addition, the report includes a brief assessment of the feasibility of employing certain advanced rotorcraft designs to meet the stringent combination of operational capabilities desired by the Public Service Helicopter Users. ### AIRCRAFT OF THE FUTURE

S. YEGER (OKB Tupolev, USSR) Nov. 1985 9 p Transl. into ENGLISH from Techn.-Oekonomische Inform. der Zivilen Luftfahrt (West Germany), v. 13, no. 2, 1977 p 88-90 Original language document was announced in IAA as A77-39452 Transl. by The Corporate Word, Inc., Pittsburgh, Pa.
(Contract NASW-4006)
(NASA-TM-77952; NAS 1.15:77952) Avail: NTIS HC A02/MF A01 CSCL 01C

Some basic problems connected with attempts to increase the size and capacity of transport aircraft are discussed. According to the square-cubic law, the increase in structural weight is proportional to the third power of the increase in the linear dimensions of the aircraft when geomettric similarity is maintained, while the surface area of the aircraft increases according to the second power. A consequence is that the fraction of useful weight will decrease as aircraft increase in size. However, in flying-wing designs in which the whole load on the wing is proportional to the distribution of lifting forces, the total bending moment on the wing will be sharply reduced, enabling lighter construction. Flying wings may have an ultimate capacity of 3000 passengers. DOE

### PRELIMINARY REPORT ON IN-FLIGHT MEASUREMENT OF ROTOR HUB DRAG AND LIFT USING THE RSRA

C. W. ACREE, JR. Oct. 1985 28 p refs
(NASA-TM-86764; REPT-85288; NAS 1.15:86764) Avail: NTIS HC A03/MF A01 CSCL 01C

The Rotor Systems Research Aircraft (RSRA) is a compound helicopter that was test flown as a fixed wing aircraft, with the main rotor blades removed and the rotor hub installed. An onboard rotor load measurement system measured the resulting rotor hub drag and lift. Measured hub drag and lift are plotted for comparison to that predicted by full scale and 1/6 scale model wind tunnel tests. The success of the demonstration gives confidence that planned improvements to the RSRA will allow high accuracy hub drag and lift measurements to be made in flight on a routine research basis. **STANDARDISED FATIGUE LOADING SEQUENCES FOR HELICOPTER ROTORS (HELIX AND FELIX). PART 2: FINAL DEFINITION OF HELIX AND FELIX**
P. R. EDWARDS and J. DARTS Aug. 1984 124 p
(AD-A156622; RAE-TR-84085; DRIC-BR-95846) Avail: NTIS HC A06/MF A01 CSCL 14B

This report defines two loading standards for the fatigue evaluation of helicopter rotor materials and components. They were developed as a collaborative study between West Germany, the Netherlands and UK. Details of the contributing organizations are given in Appendix A. The new loading standards follow the earlier TWIST (Transport Wing Standard), and FALSTAFF (Fighter Aircraft Loading Standard For Fatigue evaluation). After the tradition of these earlier loading sequences, the new loading standards have been given identifying names. For these the origin of the word helicopter (Helix-spiral, pteronwing from the Greek) has provided a convenient basis. The new standards are called: Helix loading standard for hinged or articulated rotors; Felix loading standard for fixed or semi-rigid rotors. This report defines the final form of the two standards, statistical content according to different counting methods and full details of their method of generation. GRA

**LIMITED AIRWORTHINESS AND FLIGHT CHARACTERISTICS (A AND FC) TEST OF THE QUICK FIX CONFIGURATION Final Report, 23 May - 27 Jun. 1984**
G. L. SKINNER, G. M. BISHOP, E. J. TAVARES, and R. C. MURRELL Oct. 1984 67 p
(AD-A157716; USAAEFA-83-20) Avail: NTIS HC A04/MF A01 CSCL 01C

The US Army Aviation Engineering Flight Activity conducted an evaluation to determine the increase in power required and the change in handling qualities due to the installation of the AN/ALQ-151(V)2 countermeasures system and associated mission equipment on the UH-60A helicopter. Testing conducted between 23 May to 2 June 1984 totaled 12.4 hours. The addition of the Quick Fix System and associated mission equipment created an increase in equivalent flat plate area (F sub e) of 17 sq ft (ft2) for advance ratios (mu) of 0.26 and greater. For mu's less than 0.26, the change in F sub e increased above 17 sq ft as a function of thrust coefficient. Handling qualities of the Quick Fix configured YEH-60A were unchanged from a normal utility configured UH-60A and were determined satisfactory. One deficiency, interference between the main rotor blades and the upper elements of the (no. 3 and no. 4) direction finding dipole antennas during ground taxi and four shortcomings were associated with the Quick Fix configuration. (Contract N00600-82-D-8362)
(AD-A158275; DTNSRDC/CMLD-CR-47-85) Avail: NTIS HC A05/MF A01 CSCL 13D

The general objective of this study was to conduct a survey and analysis of current and planned aircraft external fuel tanks, with emphasis on the disposability and nestability aspects of these fuel tanks. The study focused on design requirements, fabrication and assembly, and physical distribution, with particular attention directed to the use of the robotic equipment for the assembly of nestable fuel tanks aboard the ship. The principal conclusion of this study is that the development of disposable, nestable external aircraft fuel tanks with automated assembly aboard ship, using robotic equipment, is a feasible option for implementation within the next five to ten years. Chapter 1 of the report presents an introduction and summary description of the major results of the survey. Chapter 2 then provides a summary description of the tentative operational requirements established by the Navy for disposable, nestable external aircraft fuel tanks. Chapter 3 presents a discussion of the possible fabrication and assembly techniques and problems for such fuel tanks. Chapter 4 then discusses the physical distribution aspects of external aircraft fuel tanks. Chapter 5 concludes with a listing of the conclusions and recommendations resulting from this analysis. **ADVANCED TECHNOLOGY HELICOPTER LANDING GEAR PRELIMINARY DESIGN INVESTIGATION Final Report, Sep. 1983 - Jul. 1984**
J. K. SEN, M. W. VOTAW, and D. C. WEBER Jul. 1985 247 p
(Contract DAAK51-83-C-0039; DA PROJ. 1L1-62209-AH-76)
(AD-A158816; HHI-84-284; USAAVSCOM-TR-84-D-20) Avail: NTIS HC A11/MF A01 CSCL 01C

This report describes the preliminary designs of two configurations of helicopter crashworthy landing gears: (1) with the trailing arms of the main gear coupled with a torque, which forces both shock struts to absorb the kinetic energy of an unsymmetrical crash impact, and (2) with the trailing arms uncoupled; i.e., the torque tube is replaced by a cross tube which is incapable of reacting the high torsional load of an unsymmetrical crash impact. Retractable and fixed landing gears of both configurations have been designed, as well as a standard (noncrashworthy) retractable landing gear. All landing gears are of tailwheel designs. The designs apply the systems approach to crashworthiness where the total impact energy absorbed is shared by the landing gear, fuselage and seat. The designs of the crashworthy landing gears were completed after a preliminary investigation of crash impact at sink speeds up to 42 fps, roll angles up to + or - 20 degrees and pitch angles up to -10+20 degrees. The crashworthy evaluations were made with program KRASH. A detailed analysis with KRASH was then conducted for all configurations of landing gears. Based on the weight trend curves and cost analysis, a crashworthy design criterion was recommended. This design criterion was the basis for updating the landing gear design. The designs identify the fabrication methods and processes for the landing gear. Estimates of cost and weight of the updated designs are also presented. GRA

Laboratory tests were conducted to determine the individual and combined effects of a high contact ratio (HCR) planetary gearset and a stainless steel housing on the acoustic (high frequency) vibration signature of the BLACK HAWK helicopter main transmission. Vibration levels at the planetary mesh frequency increased significantly with the stainless steel housing, but increased unexpectedly with the HCR planetary. The primary reason for the increased response with the HCR was the reduced gear face widths. GRA

**AIRCREW DOSE AND ENGINE DUST INGESTION FROM NUCLEAR CLOUD PENETRATION M.S. Thesis**
S. P. CONNERS Mar. 1985 168 p
(AD-A159246; AFIT/GNE/PH/85M-4) Avail: NTIS HC A08/MF A01 CSCL 01B

This thesis evaluates the threat to aircraft and aircrew from dust and radioactivity in a cloud generated by nuclear surface bursts. A model of the nuclear cloud is generated, using any number and type of weapons and any desire dust size distribution. The cloud is propagated through the atmosphere for a given time, then penetrated by an aircraft. The activity density in the cloud is converted to dose to the crew for a given path through the cloud. Radiation shielding and dust filters are included in the calculations. Alternatively, the cloud dust mass density can be converted to mass trapped in a filter or the cabin, or to the dust mass that has entered the engine. Methods for determining particle size and altitude distributions are presented. The ionizing dose to the crewmember is computed for both sky-shine and the dust trapped in the cabin during cloud passage. A method of computing the shielding power of the crew compartment against sky-shine is presented. Given the air flow rate into a filter or engine, the mass of ingested dust is found. These nuclear cloud and aircraft models are incorporated in a computer code oriented toward operational use. A significant feature of the code includes the ability to easily change the scenario with menu driven options. GRA

**MISSILE GUIDANCE BASED ON KALMAN FILTER ESTIMATION OF TARGET MANEUVER**

Y. M. TANG (Chinese Aeronautical Establishment, Luoyang Dynamic Institute, People's Republic of China) and J. A. BORRIE (Cranfield Institute of Technology, England) IEEE Transactions on Aerospace and Electronic Systems (ISSN 0018-9251), vol. AES-20, Nov. 1984, p. 736-741. refs

A weakness of conventional proportional navigation for a homing missile is related to a limited effectiveness in coping with evasive maneuvers of the target. The present investigation is concerned with an extended Kalman filter which generates an estimate of target lateral acceleration. This estimate is used together with other information to generate the required lateral missile acceleration, taking into account a precomputed suboptimal control law. Attention is given to a simplified model of target behavior, the design of the extended Kalman filter, system model and missile guidance law design, and a computer simulation. The simulation shows that a substantial improvement in miss distance is achieved. G.R.

**AIR FORCE FLIGHT TEST INSTRUMENTATION SYSTEM**

M. F. LAMY (SCI Systems, Inc., Huntsville, AL) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 13-19.

The U.S. Air Force's Flight Test Instrumentation System (AFFTIS) is being developed to furnish flight test instrumentation capabilities for aircraft through the 1990s. The AFFTIS System Controller (ASC) orchestrates the functions of the airborne PCM system, which encompasses a central control unit and distributed data acquisition units (DAUs) via high speed serial/response data bus. Each of the remote DAUs includes a memory containing format information. The command from the ASC points to the correct format instruction location within the DAU. All of the PCM format structure is user-definable and programmable. Attention is given to ground and laboratory support equipment. O.C.

**A PROGRAMMABLE DATA ACQUISITION SYSTEM WITH INTEGRATED TEST AND CALIBRATION FACILITIES**

A. ZACH and R. GANDERT (DFVLR, Institut fuer Flugmechanik, Brunswick, West Germany) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 155-172.

The accurate and testable data acquisition system developed for the Advanced Technologies Testing Aircraft System consists of a distributed modular microprocessor system with signal conditioning units that are located near the system's sensors. Control is exercised by a master unit with integral PCM encoder. Flexible signal conditioning, which features software-controlled parameters and adaptable signal inputs, can be automatically tested via an analog calibration bus that uses switchable signal paths. O.C.

**MILITARY AVIONICS**

G. WARWICK Flight International (ISSN 0015-3710), vol. 128, Oct. 5, 1985, p. 24-31.

The advanced cockpit displays being developed to exploit the capabilities of state of the art digital avionics are described, along with the avionics systems. Triple and quadruple redundancy is being used to enhance digital systems, and their associated servosystems, to reliability levels offered by part-mechanical systems. The introduction of color-coded CRT graphics displays, voice activated controls and AI into the cockpit alters the pilot role to that of a flight manager. Recent advances in shadow-mask CRT technologies have provided the full-color, adequate brightness/resolution and reliability, i.e., vibration resistance, needed for fighter cockpit applications such as moving map displays. For the on-board computer, multiple pathways augment failure tolerance and allow majority voting, although triply redundant systems must employ more self-checking than quadruply redundant systems. Acceptable totally fly-by-wire systems permit active, automated control of dynamically unstable aircraft configurations such as the X-29. M.S.K.

**ICING WIND TUNNEL TESTS ON THE CSIRO LIQUID WATER PROBE**

W. D. KING (CSIRO, Cloud Physics Laboratory, Sydney, Australia), J. E. DYE, J. W. STRAPP (National Center for Atmospheric Research, Boulder, CO), D. BAUMGARDNER (Department of the Environment, Atmospheric Environment Service, Downsview, Canada), and D. HUFFMAN (Particle Measuring Systems, Inc., Boulder, CO) Journal of Atmospheric and Oceanic Technology (ISSN 0739-0572), vol. 2, Sept. 1985, p. 340-352. refs

The CSIRO probe for airborne measurements of liquid water content (LWC) is currently used by many research organizations. It was felt that a series of icing wind tunnel comparisons and calibrations of the type performed on the Johnson-Williams (JW) probe by Strapp and Schemenauer (1982) would help to evaluate the performance of the probe. The present paper provides a description of such tests. Aspects of tunnel calibration awe discussed along with the tunnel profiles, details regarding the employed probes, and the analysis of the probe data. Attention is given to the effect of varying yaw angle, the effects of varying the operating temperature, the effect of airspeed, the effect of ambient temperature, the replacement heads, the effects of power supply voltage, the offset voltage and its effect on damping, long-term stability, inoperative slave wires and inconsistencies. G.R.

**EVALUATION OF METEOROLOGICAL AIRBORNE DOPPLER RADAR. I DUAL-DOPPLER ANALYSES OF AIR MOTIONS. II - TRIPLE-DOPPLER ANALYSES OF AIR MOTIONS**
P. H. HILDEBRAND and C. K. MUELLER (National Center for Atmospheric Research, Boulder, CO) Journal of Atmospheric and Oceanic Technology (ISSN 0739-0572), vol. 2, Sept. 1985, p. 362-392. refs

A number of studies have shown that ground-based Doppler radars are valuable tools for atmospheric sciences research. However, ground-based Doppler observations are limited to measurements of phenomena which occur within the area covered by the radars. Some of the problems of ground-based radars can be overcome by making use of airborne Doppler radars. During the past two years, the potential value of practical airborne Doppler radar systems has been demonstrated in tests of a 3-cm Doppler radar aboard the NOAA P3 aircraft. In the present paper, observations are presented of a convective storm by airborne and ground-based Doppler radars, taking into account also the subsequent comparative analyses of the storm structure. G.R.

**AUTOMATION AND INTEGRATION ON AFTI/F-16**
A. F. BARFIELD and F. R. SWORTZEL (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 8 p.
(AIAA PAPER 85-3089)

The techniques being pursued in the Advanced Fighter Technology Integration (AFTI/F-16) program to provide enhanced automation, effectiveness and reliability in fighter aircraft are surveyed. The goal is to furnish increased lethality and deliverability of weapons systems and augmented maneuverability while keeping the pilot workload at manageable levels. Triply-redundant computers provide for fully digital mechanization for multimode flight control. Each flight phase is decoupled from others and automated wherever possible, in addition to simplifed vertical and sideways manual translation control. Enhanced control is achieved with blended surfaces control, with control modes selected as one-button options. Automation also covers trajectory control for bombing, air-to-air gunnery, collision avoidance and integrated systems operation. M.S.K.

**RADIOMETRIC CHARACTERIZATION METHODS FOR INFRARED COUNTERMEASURES SYSTEMS**
J. L. GRANGAARD (USAF, Infrared and Laser Standards Laboratory, Newark Air Force Station, OH), C. LINK (Northrop Corp., Defense Systems Div., Rolling Meadows, IL), G. SPADE (Sanders Associates, Inc., Nashua, NH), and W. RAMSEY (Loral Electro-Optical Systems, Inc., Pasadena, CA) IN: Optical radiation measurements; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1985, p. 39-46.

For the purpose of jamming an infrared tracker, Infrared Countermeasures Systems (IRCM) produce a complicated pulsed pattern of infrared radiation. The produced radiation varies rapidly with time, direction, and wavelength. Large simulation facilities are employed to test the effect which these systems produce on the tracking ability of an infrared seeker. A number of measurement facilities have been designed for the evaluation of IRCM systems. The present paper provides a detailed description of the measurement system used at Newark Air Force Station. Attention is given to the radiometer measurement equation, the relative spectral output measurement, spectral scaling factor measurement, an estimate of measurement error, methods of measuring radiant intensity, and an intercomparison of techniques. **FIBER OPTIC AIRCRAFT SYSTEMS ELECTROMAGNETIC PULSE (EMP) SURVIVABILITY**
B. GAGE, R. GREENWELL, M. SUMMERLIN, and B. ZETLEN (Science and Engineering Associates, Inc., Seattle, WA) IN: Fiber optics in adverse environments II; Proceedings of the Meeting, San Diego, CA, August 22-24, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 109-115. refs

It is pointed out that a single eletromagnetic pulse (EMP) event can disrupt or destroy vital military electronics and aircraft avionics which operate in an area as large as the entire continental United States. This paper is concerned with the application of fiber optic technology for aircraft systems EMP survivability optic technology. In the case of the present methodology of data and signal transfer in aircraft, complex electromagnetic protection techniques are needed to protect aircraft avionics from lightning, EMP, and electromagnetic interference. The EMP problem is further enhanced by the increased use of new nonmetallic composite aircraft structural materials which diminish outer layer topological shielding. Fiber optic technology, in connection with its inherent dielectric nature, provides the most cost-effective alternative to conventional shielded transmission paths. G.R.

**PERFORMANCE OF AN ALPHA-VANE AND PITOT TUBE IN SIMULATED HEAVY RAIN ENVIRONMENT Final Report**
J. K. LUERS and I. B. FISCUS Oct. 1985 32 p refs
(Contract NAG1-522)
(NASA-CR-176353; NAS 1.26:176353; UDR-TR-85-131) Avail: NTIS HC A03/MF A01 CSCL 01D

Experimental tests were conducted in the UDRI Environmental Wind/Rain Tunnel to establish the performance of an alpha-vane, that measures angle of attack, in a simulated heavy rain environment. The tests consisted of emersing the alpha-vane in an airstream with a concurrent water spray penetrating vertically through the airstream. The direction of the spray was varied to make an angle of 5.8 to 18 deg with the airstream direction in order to simulate the conditions that occur when an aircraft lands in a heavy rain environment. Rainrates simulated varied from 1000 to 1200 mm/hr which are the most severe ever expected to be encountered by an aircraft over even a 30 second period. Tunnel airspeeds ranged from 85 to 125 miles per hour. The results showed that even the most severe rainrates produced a misalignment in the alpha-vane of only 1 deg away from the airstream direction. Thus for normal rain conditions experienced by landing aircraft no significant deterioration in alpha-vane performance is expected. B.W.

**EXPERIMENTAL EVALUATION OF HEAVY FAN-HIGH-PRESSURE COMPRESSOR INTERACTION IN A THREE-SHAFT ENGINE. I - EXPERIMENTAL SETUP AND RESULTS**
A. SCHAEFFLER (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) and D. C. MIATT (Rolls-Royce, Ltd., Bristol, England) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 828-832.
(ASME PAPER 85-GT-173)

Severe aerodynamic interaction between the fan core stream section and the high-pressure compressor of a three-shaft, low bypass ratio engine is described. At high fan running lines, a heavy single-cell rotating stall was found in the fan core stream even at high aerodynamic speeds of between 90-98 percent. The rotating circumferential distortion with 180-200 deg sector angle is swallowed by the intermediate pressure compressor, but erodes the high pressure compressor surge margin by about 22 percent, leading to steady-state surges. A remotely mounted transducer in a specific arrangement was used successfully for measurements in the hot environment behind intermediate and high pressure compressor using a 'long-line' system with a closed end at the downstream pipe. **FIBER OPTICS FOR PROPULSION CONTROL SYSTEMS**
R. J. BAUMBICK (NASA, Lewis Research Center, Cleveland, OH) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 851-855. Previously announced in STAR as N84-14111.
(ASME PAPER 84-GT-97)

In aircraft systems with digital controls, fiberoptics has advantages over wire systems because of its inherent immunity to electromagnetic noise (EMI) and electromagnetic pulses (EMP). It also offers a weight benefit when metallic conductors are replaced by optical fibers. To take full advantage of the benefits of optical waveguides, passive optical sensors are also being developed to eliminate the need for electrical power to the sensor. Fiberoptics may also be used for controlling actuators on engine and airframe. In this application, the optical fibers, connectors, etc. will be subjected to high temperature and vibrations. This paper discussed the use of fiberoptics in aircraft propulsion systems together with the optical sensors and optically controlled actuators being developed to take full advantage of the benefits which fiberoptics offers. The requirements for sensors and actuators in advanced propulsion systems are identified. The benefits of using fiberoptics in place of conventional wire systems are discussed as well as the environmental conditions under which the optical components must operate. B.W.

**THE DESIGN, PERFORMANCE AND ANALYSIS OF A HIGH WORK CAPACITY TRANSONIC TURBINE**
J. D. BRYCE, M. R. LITCHFIELD, and N. P. LEVERSUCH (Royal Aircraft Establishment, Farnborough, England) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 931-937. refs
(ASME PAPER 85-GT-15)

This paper describes the design and testing of a high work capacity single-stage transonic turbine of aerodynamic duty tailored to the requirements of driving the high-pressure core of a lowcost turbofan engine. Aerodynamic loading was high for this duty, and a major objective in the design was the control of the resulting transonic flow to achieve good turbine performance. Practical and coolable blading was a design requirement. At the design point (pressure ratio = 4.48), a turbine total-to-total efficiency of 87.0 percent was measured, based on measured shaft power and a tip clearance of 1.4 percent of blade height. In addition, the turbine was comprehensively instrumented to allow measurement of aerofoil surface static pressures on both stator and rotor; the latter being expedited via a rotating 'scanivalve' system. Downstream area traverses were also conducted. Analysis of these measurements indicates that the turbine operates at overall reaction levels lower than design, but the rotor blade performs efficiently. Author

**MATERIALS AND MANUFACTURING PROCESSES FOR ADVANCED JET ENGINES**
R. E. SCHAFRIK (USAF, Systems Command, Andrews AFB, MD) and R. WILLIAMS (USAF, Materials Laboratory, Wright-Patterson AFB, OH) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 1424-1429. refs

This paper will discuss requirements and developments in materials performance, manufacturing quality, and life cycle cost for future jet engines. Advances in powered flight have always required improvements in engine technology which, in turn, has oftentimes been paced by progress in materials and manufacturing technology. In addition, man-rated aircraft demand the ultimate in propulsion system reliability. As a result, assuring quality of aeronautical engine parts and assemblies has become as important as the material properties used by the design engineer. And since the cost of owning and operating aircraft has become a key factor in selecting a system and determining the quantity to be purchased, factors such as engine durability, ease of repair, and in-service inspectability now have equal status to material performance and manufacturing quality. The impact of these three elements is playing a significant role in determining future directions for military jet aircraft engines. Author

**CUMULATIVE-DAMAGE MODELING OF FATIGUE CRACK GROWTH IN TURBINE ENGINE MATERIALS**
J. M. LARSEN and T. NICHOLAS (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) Engineering Fracture Mechanics (ISSN 0013-7944), vol. 22, no. 4, 1985, p. 713-730. refs
(Contract AF PROJECT 2307P102)

Life predictions of turbine engine structural components utilize fracture mechanics principles to determine fatigue crack growth rates. Fatigue cracks grow under conditions of variable temperature, frequency, hold time, stress ratio and stress level. At elevated temperatures, time-dependent material behavior can play a significant role in the material behavior. Cumulative-damage models must account for all these variables as well as interaction effects. The earliest modeling involved interaction schemes and, primarily, time-independent material behavior. More recent work has focused on time-dependence and creep-fatigue interaction effects. A review of current modeling concepts is presented. Author

**VIBRATION ANALYSIS OF ROTATING TURBOMACHINERY BLADES BY AN IMPROVED FINITE DIFFERENCE METHOD**
K. B. SUBRAHMANYAM and K. R. V. KAZA (NASA, Lewis Research Center, Cleveland, OH) International Journal for Numerical Methods in Engineering (ISSN 0029-5981), vol. 21, Oct. 1985, p. 1871-1886. refs

The problem of calculating the natural frequencies and mode shapes of rotating blades is solved by an improved finite difference procedure based on second-order central differences. Lead-lag, flapping and coupled bending-torsional vibration cases of untwisted blades are considered. Results obtained by using the present improved theory have been observed to be close lower bound solutions. The convergence has been found to be rapid in comparison with the classical first-order finite difference method. While the computational space and time required by the present approach is observed to be almost the same as that required by the first-order theory for a given mesh size, accuracies of practical interest can be obtained by using the improved finite difference procedure with a relatively smaller matrix size, in contrast to the classical finite difference procedure which requires either a larger matrix or an extrapolation procedure for improvement in accuracy. **DEVELOPMENT OF MODERN TURBOPROP ENGINES**
H. I. H. SARAVANAMUTTOO (Carleton University, Ottawa, Canada) (NATO, AGARD, Specialist Meeting on Aerodynamics and Acoustics of Propellers, Toronto, Canada, Oct. 1984) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, June 1985, p. 131-139. NSERC-supported research. refs

An evaluation is made of configurational possibilities and technology readiness considerations relevant to the design of turboprop powerplants suitable for 'propfan' propulsion of airliners, with attention to engine core performance advancements made since turboprops were last used in airliners (the late 1950s) and the critical upgrading of transmissions for the higher power levels envisaged. The technical risks foreseen suggest a channeling of initial efforts toward engines of moderate, 10,000-12,000 shp output; the goal of Mach 0.8 cruise speeds for such power plants, as set by NASA, may be overly ambitious. O.C.

(AIAA PAPER 85-1354)

The Dynamic Engine Analysis Program, DEAN, is a FORTRAN code implemented on the IBM/370 mainframe at NASA Lewis Research Center for digital simulation of turbofan engine dynamics. DEAN is an interactive program which allows the user to simulate engine subsystems as well as full engine systems with relative ease. The nonlinear first order ordinary differential equations which define the engine model may be solved by one of four integration schemes, a second order Runge-Kutta, a fourth order Runge-Kutta, an Adams Predictor-Corrector, or Gear's method for still systems. The numerical data generated by the model equations are displayed a specified intervals between which the user may choose to modify various parameters affecting the model equations and transient execution. Following the transient run, versatile graphics capabilities allow close examination of the data. DEAN's modeling procedure and capabilities are demonstrated by generating a model of simple compressor rig. Author

**RIBBON-BURNER SIMULATION OF T-700 TURBINE SHROUD FOR CERAMIC-LINED SEALS RESEARCH**
J. K. LITTLE (USAF, Arnold Air Force Station, TN), G. P. ALLEN, G. MCDONALD, and R. C. HENDRICKS (NASA, Lewis Research Center, Cleveland, OH) . Ceramic Engineering and Science Proceedings (ISSN 0196-6219), vol. 6, July-Aug. 1985, p. 849-861. Previously announced in STAR as N85-19364. refs

Experimental and analytical studies were conducted to determine the acceptability of a ribbon-burner simulation of engine conditions for testing ceramic-lined turbine tip shrouds. The calculated values reveal that the ribbon burner establishes at least as harsh a thermal environment as is present at any time within the turbine shroud. Comparisons were made with ceramic components in a turboshaft engine. Author

**TEST OF JET ENGINE TURBINE BLADES BY THERMOGRAPHY**
K. DING (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) IN: International Conference on Thermal Infrared Sensing for Diagnostics and Control (Thermosense VII), Cambridge, MA, November 5-8, 1984, Proceedings . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1985, p. 52-56. refs

Two applications of thermography for testing and development of turbomachinery components are described. Fabrication defects in the cooling system of internally cooled turbine blades are detected by transient heating of the blade and measuring its surface temperature distribution by an infrared imaging system. Defects like blocking, narrowing, widening, and mispositioning of cooling channels can clearly be identified by the disturbance of the transient surface temperature distribution of the blade. To improve the cooling configuration of turbine blades, the cooling effectiveness over the total blade surface must be determined under test conditions similar to those in the turbomachine. The infrared measurement of blade surface temperature distributions in a hot air cascade and the method for correcting the infrared intensities for radiation reflected at the measuring surface are illustrated in an example. **COMPRESSOR RESEARCH FACILITY F100 HIGH PRESSURE COMPRESSOR INLET TOTAL PRESSURE AND SWIRL PROFILE SIMULATION Final Report, Dec. 1980 - Nov. 1983**
W. W. COPENHAVER Oct. 1984 287 p
(Contract AF PROJ. 3066)
(AD-A157108; AFWAL-TR-84-2030) Avail: NTIS HC A13/MF A01 CSCL 21E

The F100 gas turbine engine currently powers the Air Force F-15 and F-16 aircraft. The compression section of this engine consists of a three-stage fan followed by a ten-stage High Pressure Compressor (HPC). A component test of the F100 HPC will be performed in the Compressor Research Facility (CRF) of the Aero Propulsion Laboratory (APL) at Wright-Patterson Air Force Base, to investigate its stall and post stall characteristics. This testing will require that the high pressure compressor entrance profiles be simulated to obtain results which correspond to actual engine operation. Since these entrance profiles had never been measured, a program was designed to experimentally measure the total and static pressure, temperature and flow angle profiles at the HPC entrance of an F100 Series 3 engine (F100 (3)), (S/NP072). The measured profile data were then used as design data for a set of inlet screens and vanes. These vanes and screens will simulate the engine fan discharge profiles for the HPC test. The manufactured screens and vanes were tested in Room 24 of Building 18 of the Air Force Wright Aeronautical Laboratories to verify their simulation capabilities. Five separate test periods were necessary to achieve the program goals. These tests are described in Sections 2 thru VI. The program discussion and conclusions are presented in Section 7 and 8. GRA

(AD-A157643; AFESC/ESL-TR-84-61) Avail: NTIS HC A04/MF A01 CSCL 21B

This study was carried out to augment the results of an earlier investigation of turbine engine emissions. Experiments were conducted to investigate the photochemical reactivity and biological activity of exhaust from a full-scale 60 deg. sector combustor from a TF-39 turbine engine. All experiments were carried out at idle power setting. The study utilized exhaust from two conventional petroleum fuels (JP-4 and JP-5) and a shale fuel meeting JP-4 specifications Photochemical reactivity was studied with two large (8 cum 3)n Teflon outdoor environmental chambers. Photochemical reactivity is defined for purposes of this study as the maximum ozone concentration produced during a one day irradiation in natural sunlight. Experiments were undertaken with a TF-39 combustor operating on JP-4 and JP-5 fuels, for comparison with pervious studies of a full-scale TF-39 engine. The combustor exhaust was more effective than exhaust from the full-scale engine, regardless of which fuel was burned. The combustor exhaust was 60 percent more reactive than engine exhaust for JP-5 fuel, and between 30 and 100 percent more reactive for JP-4 fuel. The photochemical reactivity of exhaust generated from a shale oil-derived fuel meeting JP-4 specifications was studied. Exhaust from the shale fuel was no more reactive than exhaust from petroleum fuels, and under some circumstances was actually less reactive. The shale fuel exhaust also generated less secondary aerosol than exhaust from the petroleum fuels. GRA

An experimental Single Cylinder Test Engine Program is conducted to confirm the analytically projected performance of a two-stroke cycle diesel engine for aircraft applications. The test engine delivered 78kW indicated power from 1007cc displacement, operating at 3500 RPM on Schnuerle loop scavenged two-stroke cycle. Testing confirms the ability of a proposed 4-cylinder version of such an engine to reach the target power at altitude, in a highly turbocharged configuration. The experimental program defines all necessary parameters to permit design of a multicylinder engine for eventual flight applications; including injection system requirement, turbocharging, heat rejection, breathing, scavenging, and structural requirements. The multicylinder engine concept is configured to operate with an augmented turbocharger, but with no primary scavenge blower. The test program is oriented to provide a balanced turbocharger compressor to turbine power balance without an auxiliary scavenging system. Engine cylinder heat rejection to the ambient air has been significantly reduced and the minimum overall turbocharger efficiency required is within the range of commercially available turbochargers. Analytical studies and finite element modeling is made of insulated configurations of the engines - including both ceramic and metallic versions. A second generation test engine is designed based on current test results. Author

**HUB EFFECTS IN PROPELLER DESIGN AND ANALYSIS**
M. H. WANG Jul. 1985 183 p
(Contract N00014-82-K-0198)
(AD-A158853; OE-85-14) Avail: NTIS HC A09/MF A01 CSCL 20D

A numerical model is established for the design of propeller blade shape for a prescribed circulation and a given hub geometry. The vortex lattice approach is adapted for blades and their wakes. The hub is represented by a distribution of dipoles which ends at the hub apex. It is shown that consideration of the hub results in a lower pitch and lower camber at the inner radii. An iterative method is developed for analyzing the interference between the blades and the hub. It is shown that the circulation at the root of a propeller with a hub is larger than the circulation at the root of a propeller without a hub. Two examples show that the increase in thrust due to hub effects has the same order of magnitude as the drag force effects on the hub for propellers which are moderately loaded at the hub. Experiments are carried out for comparison with the numerical results. Excellent agreement is obtained in the circulation distribution for a conventional propeller, and fair agreement for a controllable pitch propeller. Experimental results show what the circulation is, roughly speaking, conserved. A method for estimating the drag force of the hub due to the hub vortex is established by assuming that the circulation is conserved. GRA

**ESTIMATION OF THE PROBABILITY OF A FLIGHT PARAMETER EXCEEDING A SPECIFIED VALUE UNDER CONDITIONS OF ATMOSPHERIC TURBULENCE [OTSENKA VEROIATNOSTI PREVYSHENIIA PARAMETROM POLETA ZADANNOGO ZNACHENIIA PRI DEISTVII ATMOSFERNOI TURBULENTNOSTI]**
I. N. TITOVSKII and I. G. KHVOSTOVA TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 74-81. In Russian. refs

The problem of the estimation of the probability of a flight parameter exceeding a specified value due to atmospheric turbulence is solved in the linear approximation using a continuous turbulence model and the stochastic process overshoot theory. A method is proposed for determining the probability of a parameter exceeding a specified value at least once during one hour of flight or per flight path unit length. The method also makes it possible to determine the average number of such overshooots per flight. V.L.

**A86-13365**

### MINIMIZATION OF AIRCRAFT FLIGHT TIME FOR A GIVEN DISTANCE WITH RETURN TO THE ORIGINAL POINT [MINIMIZATSIIA VREMENI POLETA SAMOLETA NA ZADANNUIU DAL'NOST' S VOZVRASHCHENIEM V ISKHODNUIU TOCHKU]

V. F. ILLARIONOV and V. T. PASHINTSEV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 54-67. In Russian. refs

An approximate approach is used to consider the problem of minimizing the flight time of an aircraft with a fixed fuel supply for a given distance with return to the original point. The optimal flight profile is constructed on the basis of the standard energy method with variation of only one parameter having a physical significance. A description is given of a method for determining the saddle points of a family of extrema corresponding either to steady-state flight regimes or to singular thrust-control regimes. A numerical example concerning flight at a constant altitude is given. B.J.

**A86-13435**

### METHOD FOR CALCULATING THE EQUILIBRIUM SPIN OF AN AIRCRAFT [METOD RASCHETA USTANOVIVSHEGOSIA DVIZHENIIA SAMOLETA PO SPIRALI]

V. K. SVIATODUKH TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 6, 1984, p. 51-62. In Russian. refs

Equations for the equilibrium spin of an aircraft are obtained in a form containing the angle of attack alpha, the sideslip angle beta, the direction cosines of the vertical, and the parameter (omega) (V)/g, where omega is the angular velocity and V is the modulus of the center-of-mass velocity. The direction cosines of the vertical are determined as explicit functions of alpha, beta, and (omega)(V)/g in the case when the aerodynamic forces do not depend on the angular velocities of the aircraft. In this case the complete equations of equilibrium motion are reduced to three moment equations depending on the above three variables. A method for the approximate determination of the dependence of the aerodynamic forces on the angular velocities of the aircraft is proposed. B.J.

**A86-13436**

### CALCULATION OF EQUILIBRIUM TURN [RASCHET USTANOVIVSHEGOSIA VIRAZHA]

A. A. SHILOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 6, 1984, p. 63-70. In Russian.

A method is developed for calculating the characteristics of such motions of an aircraft as equilibrium turn, descending turn, and equilibrium spin. Particular attention is given to the structure of the kinematic and dynamic equations used to solve the problem for arbitrary aerodynamic characteristics of the aircraft. B.J.

**A86-13931**

### DYNAMICS OF NON-AUTONOMOUS SPATIAL MOTION OF AN AEROPLANE WITH DEFORMABLE CONTROL SYSTEMS

Z. DZYGADLO and A. KRZYZANOWSKI Journal of Technical Physics (ISSN 0324-8313), vol. 25, no. 1, 1984, p. 53-77. refs

The dynamics of nonautonomous spatial motion of an aircraft with deformable control systems and moving ponderable control surfaces is analyzed. A complete nonlinear set of equations of spatial motion is derived, introducing time-dependent external forces and taking into account the elasticity and damping in the control systems and the unbalance of the ailerons, the elevator, and the rudder. A program for the numerical integration of the equations by the Runge-Kutta-Gill method is used. The effect of external forces on the dynamics of the aircraft's spatial motion is studied. The influence of stiffness and damping in the controls is investigated with a numerical resonance analysis of the oscillating control surface. C.D.

### LONGITUDINAL STABILITY OF A HOVERING, TETHERED ROTORCRAFT

D. C. RYE (Sydney, University, Australia) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 8, Nov.-Dec. 1985, p. 743-752. refs

Linearized equations describing the perturbed longitudinal motion of a tethered rotorcraft are presented. The tethering cable is assumed to be straight and inextensible. This permits development of two degree-of-freedom equations which admit cable tension variations. Routh's criteria are applied to a simplified stability quartic for hovering flight in an analytic search for stable configurations. The cable length, equilibrium tension, and point of attachment strongly influence the stability of perturbed motion. If the cable is short, the machines considered may be inherently stable. This does not appear to be possible for hovering flight on very long cables. Numerical solutions to the complete stability quartic show good agreement with approximate Routh's-criteria predictions. Author

### STABILITY AND CONTROL OF VTOL CAPABLE AIRSHIPS IN HOVERING FLIGHT

H. C. CURTISS, JR. (Princeton University, NJ) and V. SUMANTRAN Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 8, Nov.-Dec. 1985, p. 753-760. refs

(Contract NAG2-98)

The stability and control characteristics of an airship equipped with lifting rotors to provide a modest VTOL capability are discussed. The rotors are used for control and maneuvering in near-hovering flight. Configurations with two, three, and four lifting rotors are examined and compared with respect to control capabilities and dynamic response characteristics. Linearized models of the dynamics are employed for this study. A new approach to the prediction of rotor derivatives for operation near zero thrust in hover is presented. It is found that all three configurations have similar control and response characteristics. The responses are characterized by long time constants and low levels of angular damping. Author

**A SELF-REPAIRING AIRCRAFT?**

E. J. LERNER Aerospace America (ISSN 0740-722X), vol. 23, Nov. 1985, p. 22, 24.

Attention is given to a computer program which will allow future control-configured fighter aircraft to automatically compensate for the loss of a control surface due to combat damage, in order to maintain stability. Such a system, if successfully implemented, would also be able to compensate for electronic and hydraulic system failures, effectively obviating the presently critical requirement for four-fold redundancy in such systems. This would reduce cost and complexity, while increasing MTBF. The reliable detection of system failures is identified as a major problem in implementation. O.C.

**INTERACTIVE AIRCRAFT FLIGHT CONTROL AND AEROELASTIC STABILIZATION Semiannual Report, 1 May - 31 Oct. 1985**

T. A. WEISSHAAR Nov. 1985 48 p refs
(Contract NAG1-157)
(NASA-CR-176323; NAS 1.26:176323) Avail: NTIS HC A03/MF A01 CSCL 01C

Aeroservoelastic optimization techniques were studied to determine a methodology for maximization of the stable flight envelope of an idealized, actively controlled, flexible airfoil. The equations of motion for the airfoil were developed in state-space form to include time-domain representations of aerodynamic forces and active control. The development of an optimization scheme to stabilize the aeroelastic system over a range of airspeeds, including the design airspeed is outlined. The solution approach was divided in two levels: (1) the airfoil structure, with a design variable represented by the shear center position; and (2) the control system. An objective was stated in mathematical form and a search was conducted with the restriction that each subsystem be constrained to be optimal in some sense. Analytical expressions are developed to compute the changes in the eigenvalues of the closed-loop, actively controlled system. A stability index is constructed to ensure that stability is present at the design speed and at other airspeeds away from the design speed. E.A.K.

**FLUTTER CLEARANCE TESTS ON A TRANSAVIA PL-12/T-400 SKYFARMER**

A. GOLDMAN and S. GALEA Mar. 1985 66 p
(AD-A157212; ARL/STRUC-TM-400) Avail: NTIS HC A04/MF A01 CSCL 20D

The Transavia T-400 Skyfarmer is the latest version of the twin-boom agricultural aircraft and incorporates several changes from the T-300 model previously tested. Changes which could affect the flutter characteristics are: (1) Change of engine from 6 cylinder 300 horsepower to 8 cylinder 400 horsepower; (2) Increase in length of tail booms by 750 mm; (3) Increase in stub-wing span by 900 mm; (4) Removal of the spring-tab from the elevators; and (5) Addition of a dorsal stabilizer fin along each tail boom. A ground resonance test and subsequent flight tests were conducted on a Transavia T-400 Skyfarmer. The natural modes and frequencies of vibration were measured in the ground tests, and monitored during flight tests in which attempts were made to induce flutter. The results of these tests are presented. GRA

**POST STALL MANEUVERS AND THRUST VECTORING PERFORMANCE ANALYSIS Final Technical Report, Aug. 1983 - Jul. 1984**

L. E. MILLER Jul. 1984 77 p
(Contract AF PROJ. 2404)
(AD-A158100; AFWAL-TR-84-3109) Avail: NTIS HC A05/MF A01 CSCL 01B

The purpose of this effort was to determine whether or not there are any apparent performance improvements through post stall maneuvers (PSM) or thrust vectoring. The PSM is a result of high angles of attack, greater than the stall value. Two different problems were addressed. The first examined instantaneous turning performance. The second focused on minimum time turn problems. The impact of both vectored and nonvectored thrust was considered. It was proven that minimum time turns fall in the vertical plane. For maximum instantaneous turning rate and nonvectored thrust high angle of attack results if the speed is less than the critical speed which is approximately Mach 0.2. The optimal angle of attack approaches 90 deg as the speed approaches zero. For vectored thrust, the stall angle of attack is optimum and the thrust vector angle is the complement of the angle of attack. The PSM is not optimal if thrust vectoring is available. For minimum time turning performance, maximum thrust is optimal. At the end of the trajectory, the optimal angle of attack equals that for maximum instantaneous performance. The PSM is optimal. As the thrust to weight ratio increases, the maximum angle of attack increases. GRA

**AN APPLICATION OF ADAPTIVE LEARNING TO MALFUNCTION RECOVERY M.S. Thesis**

R. E. CRUZ 1985 51 p
(AD-A158129; AFIT/CI/NR-85-85T) Avail: NTIS HC A04/MF A01 CSCL 01D

A self-organizing controller was developed for a simplified two-dimensional aircraft model. The controller learns how to pilot the aircraft through a navigational mission without exceeding pre-established position and velocity limits. The controller pilots the aircraft by activating one of eight directional actuators at all times. By continually monitoring the aircraft's position and velocity with respect to the mission, the controller progressively modifies its decision rules to improve the aircraft's performance. When the controller has learned how to pilot the aircraft, two actuators fail permanently. Despite this malfunction, the controller regains proficiency at its original task. The experimental results reported show the controller's capabilities for self-organizing control, learning, and malfunction recovery. GRA

**JAPANESE REPORT ON CHINA'S F-8 FIGHTER**
Y. YUEBO *In its* China Rept.: Sci. and Technol. (JPRS-CST-85-035) p 70-72 17 Oct. 1985 Transl. into ENGLISH from Hangkong Zhishi (Beijing), no. 7, Jul. 1985 p 22-23
Avail: NTIS HC A08/MF A01

A new Chinese-built fighter aircraft has been unveiled. This aircraft, which is named the F-8, has a delta wing and a horizontal tail; it probably has two engines, and its maximum speed is estimated to be greater than Mach2. According to the article 1983-1984 Military Balance, approximately thirty F-8 aircraft are currently in service in the Chinese Air Force. G.L.C.

**PITCH RATE VERSUS G COMMAND AS THE LONGITUDINAL FLIGHT CONTROL SYSTEM DESIGN STRATEGY FOR A STATISTICALLY UNSTABLE FIGHTER TYPE AIRCRAFT WITH TWO CONTROL SURFACES**
T. P. WEBB 2 Jul. 1985 32 p
(AD-A158803; USAFA-TN-85-8) Avail: NTIS HC A03/MF A01 CSCL 01D

Pitch rate command and normal G command longitudinal flight control systems were designed using linear optimal control theory for a statically unstable, two control surface, fighter-type aircraft at both a power approach and an up-and-away flight condition. The closed-loop systems were then evaluated in man-in-the-loop simulations with pilots attempting random altitude tracking and pitch tracking tasks. The evaluation results indicated that in the power approach flight condition, normal G command was more suitable for altitude tracking and pitch rate command was preferred for pitch tracking. Results for the up-and-away flight condition were inconclusive. GRA

**DIGITAL SERVOCONTROLLER SYSTEM. VOLUME 4. RESULTS AND CONCLUSIONS Final Report, Jul. 1983 - Nov. 1984**
J. LOPEZ and K. MILLER Feb. 1985 31 p
(AD-A159068; SWRI-14-7676-VOL-4; AFWAL-TR-84-3117-VOL-4)
Avail: NTIS HC A03/MF A01 CSCL 09B

This final report describes an exploratory development effort for the design and fabrication of a digital servocontroller system for load control in full-scale air-frame fatigue tests. Each digital controller replaces four analog controllers. The LSI-11/23 microcomputer in the digital controller executes a PI algorithm to implement direct digital control. It may operate in a stand-alone mode or as a slave processor to a master computer via fiber optic link. Other programmable features specify loop parameters, building load profiles, adjusting control system gains and monitoring alarm and abort conditions. GRA

**GRUMMAN'S AUTOMATED TEST SYSTEMS**
C. SCHIANO (Grumman Data Systems Corp., Calverton, NY) IN: ITC/USA/'84; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 22-25, 1984 . Research Triangle Park, NC, Instrument Society of America, 1984, p. 147-154.

Attention is given to the features and functions of a proprietary Automated Test System (ATS) that has been successfully used to support aircraft test data processing. The ATS consists of a complement of hardware and software subsystems which, when combined with a central processor, yield the integrated system capabilities required for real time/on-line test analyses. Interactive data processing of telemetered, range-acquired, and data base-generated test data furnishes real time answers to development engineer's questions. Development histories are given for the initial (1970-1983) and current (1983-1986) configurations of the ATS, as well as projected features for the 1987-1990s time frame. O.C.

### INFLUENCE OF UNSTEADY FLOW EFFECTS ON THE LENGTH OF OPERATION OF A HYPERSONIC SHOCK TUNNEL [VLIIANIE NESTATSIONARNYKH EFFEKTOV TECHENIIA NA PRODOLZHITEL'NOST' RABOTY GIPERZVUKOVOI UDARNOI TRUBY]

V. L. GRIGORENKO, A. M. NAUMOV, and N. I. KHVOSTOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 149-155. In Russian. refs

Unsteady flow processes are considered in a hypersonic shock wind tunnel where Mach numbers of 5-20 are achieved. This flow is analyzed numerically for a wide range of governing parameters in a quasi-one-dimensional framework using a mobile variable-step computational grid with identification of the main discontinuities and high-gradient regions of gas parameters. An algorithm is developed for considering the effect of unsteady flow processes in the nozzle on the length of operation of a shock wind tunnel. B.J.

**A86-13443**

### SUBSONIC THERMAL WIND TUNNEL WITH AN EIFFEL CHAMBER [DOZVUKOVAIA TEPLOVAIA AERODINAMICHESKAIA TRUBA S KAMEROI EIFELIA]

A. M. BESPALOV, L. A. VNUKOVA, A. S. KROKHIN, and A. G. MIKHALCHENKO TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 6, 1984, p. 110-113. In Russian.

The paper gives a description of an ejector-type subsonic thermal wind tunnel with an Eiffel chamber. The wind tunnel is intended for measurements of friction distribution and viscous-flow structure on models using laser-knife, paint-drop-dispersion, and thermal-coating techniques. B.J.

**A86-13848**

### THE RIGHT COMBINATION UNLOCKS AEROSPACE EMC

O. B. M. PIETERSEN (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands) Microwaves & RF (ISSN 0745-2993), vol. 24, Oct. 1985, p. 73-76. refs

It is pointed out that aerospace vehicles present a difficult challenge for the designer concerned with electromagnetic compatibility (EMC). The requirement to keep electromagnetic interference (EMI) at acceptable levels makes it necessary to utilize a combination of empirical and computer-aided techniques. Generally, one of two basic approaches is used to ensure EMC. The specification-based approach relies on compliance with EMI specifications for each subsystem, while in the computer-aided approach, the designer predicts undesirable situations by calculations. A number of specifications are available to provide procedures for EMC testing of aerospace electronics systems and subsystems. Attention is given to transducers for EMI measurements, the major aerospace EMI specifications, EMI testing of large equipment, and the sample compatibility matrix. G.R.

### SIMULATION WORLD MOVES UP TO V/STOL

A. M. COOK (NASA, Ames Research Center, Moffett Field, CA) Aerospace America (ISSN 0740-722X), vol. 23, Nov. 1985, p. 46-48.

NASA-Ames' Vertical Motion Simulator (VMS) is a large motion amplitude manned simulator designed for investigation of landing, takeoff, and general handling qualities and control system development for STOL and VTOL aircraft. The VMS incorporates six degrees of freedom, a four-window computer-generated imagery (CGI) system, and interchangeable cabs. The CGI generates day and night scenes that can include moving objects on the ground and in flight. A project is now underway to upgrade the VMS for research on rotorcraft engaged in nap-of-the-earth flight missions. O.C.

### ENGINE SIMULATOR TECHNIQUES FOR SCALED TEST CELL STUDIES

J. D. LEE and R. J. FREULER (Ohio State University, Columbus) AIAA, SAE, ASME, and ASEE, Joint Propulsion Conference, 21st, Monterey, CA, July 8-11, 1985. 7 p. Research supported by the General Electric Co. refs
(AIAA PAPER 85-1282)

Research studies with scale model engine test cells for studying test cell aerodynamics, acoustics, and cell flow characteristics affecting engine performance have required the simulation of a variety of jet engines in accurate detail. Simulators of turboshaft engines (without propellers), low-bypass afterburning turbojets, and high-bypass turbofans were designed, fabricated and successfully operated using high-pressure air ejector systems for the motive power. The peculiar problems associated with such engine simulators and the methods used to attack these problems are described. This paper also outlines the specific designs used for four engine simulators. Author

### IMPROVED DRAG ELEMENT FOR WIND TUNNEL STING BALANCES

M. RINGEL and D. LEVIN (Technion - Israel Institute of Technology, Haifa) Journal of Aircraft (ISSN 0021-8669), vol. 22, Nov. 1985, p. 979-982. refs

The adverse relation between sensitivity and stiffness in wind tunnel internal sting balance design leads to solutions with high nonlinear interactions. Attention is presently given to a solution in which these interactions are minimized, and for which calibration results indicate an order-of-magnitude improvement in normal force interaction linearity as well as a 60 (or more) percent improvement in moment of interaction linearity. The novel sting balance design obtained on the basis of this method allows a higher sensitivity level of the drag output, with increased overall stiffness, to be obtained. O.C.

### RADIO FREQUENCY CHAMBER IMPROVES LAMPS MK III TESTING

J. B. SCHULTZ Defense Electronics (ISSN 0278-3479), vol. 17, Nov. 1985, p. 53, 54, 56.

Attention is given to the design features, performance capabilities, and prospective applications of an RF test chamber which allows ground facility-based acceptance trials of military helicopter avionics to be conducted prior to flight testing in a highly controlled (indoor) environment. Tests encompass electromagnetic environment response and security and cryptological measures, with round-the-clock operations requiring minimum preparation time and fast recuperation from operational failures. The LAMPS Mk III antisubmarine warfare helicopter is currently undergoing tests; future testing is anticipated to involve the U.S. Navy V-22 tilt-rotor and U.S. Army LHX helicopter programs. O.C.

(NASA-CR-177966; NAS 1.26:177966; AGARD-722-PAPER-1)
Avail: NTIS HC A02/MF A01 CSCL 14B

The background to the evolution of the cryogenic wind tunnel is outlined, with particular reference to the late 60's/early 70's when efforts were begun to re-equip with larger wind tunnels. The problems of providing full scale Reynolds numbers in transonic testing were proving particularly intractible, when the notion of satisfying the needs with the cryogenic tunnel was proposed, and then adopted. The principles and advantages of the cryogenic tunnel are outlined, along with guidance on the coolant needs when this is liquid nitrogen, and with a note on energy recovery. Operational features of the tunnels are introduced with reference to a small low speed tunnel. Finally the outstanding contributions are highlighted of the 0.3-Meter Transonic Cryogenic Tunnel (TCT) at NASA Langley Research Center, and its personnel, to the furtherance of knowledge and confidence in the concept. **WIND TUNNEL TURNING VANES OF MODERN DESIGN**
T. F. GELDER, R. D. MOORE, J. M. SANZ, and E. R. MCFARLAND 1985 23 p refs Proposed for presentation at the 24th Aerospace Sci. Meeting, Reno, Nev., 6-8 Jan. 1986; sponsored by AIAA
(NASA-TM-87146; E-2775; NAS 1.15:87146; AIAA-86-0044)
Avail: NTIS HC A02/MF A01 CSCL 14B

Rehabilitation of the Altitude Wind Tunnel includes the need for new corner turning vanes to match its upgraded performance. The design and experimental performance results from a 0.1-full scale model of the highest speed corner ($M = 0.35$) are presented and discussed along with some two dimensional inviscid analyses of two vaned corners. With a vane designed by an inverse two dimensional technique, the overall corner loss was about 12% of the inlet dynamic pressure of which about 4% was caused by vane skin friction. Comparable values with a conventionally designed circular arc vane were about 14% overall with about 7% due to skin friction. E.A.K.

This report describes a 4-year work unit on the selection, development, and testing of a novel airfield marking system on ceramic-coated aluminized steel (CAS) tiles. The CAS tiles were developed to replace painted center marking lines that are obliterated by rubber streaks from jet tires from landing aircraft. The tiles are recessed or set into the pavement by grinding out 50- by 30-foot sections (1/8 inch deep) and bonding the tiles with epoxy/polyamide adhesive (2,000- to 5,000-psi tensile strength). The tiles can be easily cleaned by spraying with aqueous detergent and wiping off the rubber residue. The tiles are flexible, weather-resistant, chemically resistant, and highly reflective in day or evening, without retroreflective glass spheres. At $2.00 to $5.00 sq. ft., the CAS tiles are much more expensive than Federal Specification TT-P-1952 latex paint (about $0.10 sq. ft.), but the high initial cost can be offset in 1 year by lower maintenance costs. Although these CAS tiles are still being tested for Air Force use, the life cycle might be 5 to 10 years before replacement. GRA

A. S. NEMYKIN and V. A. IAROSHEVSKII TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 85-98. In Russian. refs

The plane motion of a flight vehicle with nonlinear damping characteristics relative to its center of mass is analyzed. For the amplitude-phase variables, equations of motion are written using the Van der Pol transformation. The corresponding Fokker-Planck-Kholmogorov equations are averaged in phase, which makes it possible to determine the steady-state amplitude distribution and to solve the problem of the probability of the threshold amplitude being exceeded. Approximate analytical formulas are presented, and the results are compared with the numerical calculations. V.L.

**DYNAMIC FEATURES OF COMBUSTION**
A. K. OPPENHEIM (California, University; California, University, Lawrence Berkeley Laboratory, Berkeley) Royal Society (London) Philosophical Transactions, Series A (ISSN 0080-4614), vol. 315, no. 1534, Sept. 26, 1985, p. 471-508. refs
(Contract DE-AC03-76SF-00098; NSF CPE-83-02232; NAG3-131; NAG3-137)

The dynamic features of combustion are discussed for four important cases: ignition, inflammation, explosion, and detonation. Ignition, the initiation of a self-sustained exothermic process, is considered in the simplest case of a closed thermodynamic system and its stochastic distribution. Inflammation, the initiation and propagation of self-sustained flames, is presented for turbulent flow. Explosion, the dynamic effects caused by the deposition of exothermic energy in a compressible medium, is illustrated by self-similar blast waves with energy deposition at the front and the adiabatic non-self-similar wave. Detonation, the most comprehensive illustration of all the dynamic effects of combustion, is discussed with a phenomenological account of the development and structure of the wave. C.D.

**ATOM-PROBE MICROANALYSIS OF A NICKEL-BASE SUPERALLOY**
D. BLAVETTE, A. BOSTEL, and J. M. SARRAU (Rouen-Haute Normandie, Universite, Mont-Saint-Aignan, France) Metallurgical Transactions A - Physical Metallurgy and Materials Science (ISSN 0360-2133), vol. 16A, Oct. 1985, p. 1703-1711. refs

A field ion microscope (FIM) atom-probe has been used to investigate the phase compositions in a Nb-Mo bearing nickel-based superalloy. The composition of gamma-prime precipitates in fully heat-treated conditions was found to vary with their mean sizes. The matrix analyses revealed the presence of fine secondary precipitates (30 to 100 A) which occupy 10 percent of the overall volume of the material. The high spatial resolution of the atom-probe allowed the gamma-gamma-prime interface characterization. Composition profiles show that the transition between the phases occurs within one interplanar spacing. Finally, a long range order study of the ordered gamma-prime phase has been performed. The analysis of the L1(2) type (Ni, X)3 (Al, Y) precipitates, made on an atomic plane-by-plane basis, shows how alloying elements substitute for Ni and Al in the gamma-prime sublattice. The observed results, expressed in terms of occupancy probabilities for both types of sites, indicate that Ti, Nb, and Mo preferentially occupy Al sites while Cr and Co substitute for Ni. Author

**PROTECTING GAS TURBINE COMPONENTS - THE RELATIVE DURABILITY OF A CONVENTIONAL AND A PLATINUM-MODIFIED ALUMINIDE COATING**
J. L. COCKING, G. R. JOHNSTON, and P. G. RICHARDS (Department of Defence, Materials Research Laboratories, Maribyrnong, Australia) Materials and Design (ISSN 0261-3069), vol. 6, Oct.-Nov. 1985, p. 224-229. refs

Platinum-modified aluminide coating for high pressure turbine blades and vanes was investigated by the Australian DOD. Conventional aluminide coating degradation research showed that the platinum-modified aluminide is superior. After 750 hours of operation, marked corrosive attack of the leading edge of the blades and concave side of the airfoil and corrosion pits along the center of the concave side were evident in the conventional aluminide coated engine. The 750 hours of operation of the platinum-modified aluminide coated engine retained 50 percent of the coating thickness in the areas of greatest attack such as the leading edge blades and the concave side; however, wide shallow pits occurred in the concave mid-chord region. Therefore, it was determined that platinum-modified aluminide coated blades are fit for re-use after 750 hours and even at full overhaul of 1000 hours of operation. F.J.

**NATIONAL SAMPE SYMPOSIUM AND EXHIBITION, 30TH, ANAHEIM, CA, MARCH 19-21, 1985, PROCEEDINGS**

Symposium and Exhibition sponsored by the Society for the Advancement of Material and Process Engineering. Covina, CA, Society for the Advancement of Material and Process Engineering (Science of Advanced Materials and Process Engineering Series. Volume 30), 1985, 1698 p. For individual items see A86-13077 to A86-13093, A86-13095 to A86-13102, A86-13104 to A86-13157, A86-13159 to A86-13164, A86-13166 to A86-13181.

Among the topics discussed are novel biomedical materials, high temperature polyimides, structures and materials for space structures, pressure sensitive adhesives, materials for advanced electronics, fiber/matrix-interface technologies, composite materials' testing and analysis techniques, thermoplastic matrices, recent advancements in automated and robotic manufacturing methods, and novel polymeric materials. Also covered are surface mount assembly technology, metallic materials for automated and robotic systems, novel matrix resin technologies, surface preparation and adhesive bonding methods, spacecraft and missile material design, the application of computers to materials engineering, advancements in filament winding techniques, advanced composites' design and manufacture, and environmental management. O.C.

**A LOW TEMPERATURE CURING, QUICK REPAIR, FUEL RESISTANT AIRCRAFT SEALANT**

L. MORRIS (Products Research and Chemical Corp., Glendale, CA) and C. NADLER (U.S. Navy, Naval Air Development Center, Warminster, PA) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 102-110.

The application times and cure rates of two commercial rapid curing Thiokol polysulfide based sealants of MIL-S-8802 and MIL-S-83318 (USAF) types are compared with the results observed with mercaptan terminated polythioether based sealants cured with epoxy resins. A tentative specification requiring more rapid low temperature conversions, MIL-S-85420 (AS), was used as the performance standard. The application and aging characteristics of the products equal or exceed the standards. A long application life, quick curing polythioether is also compared with current MIL-S-8802 qualified material and found to have advantages. Author

**ADHESIVE SYSTEM FOR HIGH TEMPERATURE DESTRUCTIVE TESTING OF COMPOSITE STRUCTURES**

C. M. GOOLSBAY (Vought Corp., Aero Products Div., Dallas, TX) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 399-405.

An adhesive test program has been conducted in order to develop an adhesive rubber tension pad system that would retain acceptable mechanical properties in a 400 F environment, such as that of the Navy S-3A aircraft's engine nacelle door. Mosite 14124 silicone rubber and 14206 film adhesive proved to be a system with performance far exceeding engine nacelle door test requirements. O.C.

**A86-13103**

**COMPOSITE REPAIRS**

H. BROWN, ED. (Society for the Advancement of Materials and Process Engineering, Azusa, CA) Covina, CA, Society for the Advancement of Materials and Process Engineering (SAMPE Monograph, No. 1), 1985. 232 p. No individual items are abstracted in this volume.

A comprehensive account is given of the advanced laminate composite repair methods that have been developed to date in the aerospace field, largely for fiber-reinforced polymer matrix composite aircraft primary structures. Attention is given to repair procedures for commercial transport aircraft graphite/epoxy structures, the acoustoultrasonic evaluation of impact-damaged graphite/epoxy, field level equipment for repair operations, depot level repair techniques, and intermediate/high temperature composite repair methods. Also discussed are the specialized methodologies for thermoplastic matrix composites and boron/epoxy composites, the repair of a stability-critical structure, and the effect of manufacturing defects on the strength of aircraft composite structures. O.C.

**CONFORMAL COATING FOR SURFACE MOUNT ASSEMBLY**

R. W. MALARIK (Lear Siegler, Inc., Instrument Div., Grand Rapids, MI) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 755-759.

Conformal coating of electronic assemblies with surface mounted devices represents a unique problem particularly related to the close spacing between the device and the board surface. Paraxylylene, a logical-choice, proved not to be satisfactory with a ceramic substrate. An acrylic resin was selected and a process established which satisfactorily sealed the device from the environment. Author

**ELECTRICALLY CONDUCTIVE STRUCTURAL ADHESIVE**

M. G. BILLIAS and M. E. BORDERS (Lockheed-Georgia Co., Marietta, GA) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 1397-1407.

The electrically conductive structural adhesive developed for the C-5A military cargo aircraft can sustain the high currents of lightning strike without bond failure, and has passed all requirements of MIL-B-5087(B) in simulated lightning strike tests. It is now being used to bond static dischargers to the extremities of the C-5B variant. The adhesive incorporates aluminum particles in place of the previously employed silver, eliminating the galvanic corrosion potential that had been established with the aircraft structure. The static dischargers also withstand lightning strike currents. MIL-S-9129(B) is also successfully passed. O.C.

**A86-13172**

**AIRCRAFT FIELD REPAIR**

D. J. ZALUCHA (Lord Corp., Industrial Adhesives Div., Erie, PA) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 1419-1423.

One approach to field repair of aircraft structures is the use of low energy cure adhesives to either bond patches and doubler plates in place or to serve as matrices for the fabrication of in situ composites. Advances in adhesive chemistry have in recent years led to the formulation of both epoxy and acrylic adhesives suitable for such field repairs, which can be conveniently packaged as kits for that purpose. While the epoxy systems can be cured with portable induction heaters, the acrylic ones may in addition take the form of two-element systems that can cure rapidly without additional energy input. O.C.

**A86-13174**

**CONSTANT TEMPERATURE HEATERS FOR THE REPAIR OF COMPOSITE STRUCTURES**

R. J. WALTY (Deposition Technology, Inc., San Diego, CA) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 1441-1451.

The self-regulating heaters that have been developed to facilitate field repairs of composite aircraft structures heat to a specific temperature which is required by the resin system in question and permit careful temperature control over large areas, using unregulated ac and dc power supplies. Tests have confirmed the superiority of these heaters to the constant wattage heaters currently in use, in light of thermal contour heat distribution analyses of both types of systems. O.C.

**METALS ANAD PLASTICS - STATE OF THE ART AND PERSPECTIVES [METAUX ET PLASTIQUES - ETAT ACTUEL ET PERSPECTIVES]**
J. BRANDT, H. KELLERER, and P. WINKLER (Messerschmitt-Boelkow-Blohm GmbH, Ottobrunn, West Germany) Association Aeronautique et Astronautique de France, Journee des Pionniers Europeens, Paris, France, Apr. 25, 1985, Paper. 35 p. In French.
(MBB-Z-49-85-OE)

Progress and expected advances in metals and plastics for aerospace usage, especially aircraft primary structures, are discussed. Metals, mostly Al and Ti alloys, are still the preferred materials, and are expected to be enhanced to have lower densities and display greater fracture resistance in the future. The advances will be achieved with new additives to the alloys, powder metallurgy, and superplastic forming. Metal matrix composites are also under investigation, as are fiber-reinforced plastics (FRPs), the latter being more developed and cheaper to produce than the metal counterparts. Kevlar and carbon fiber reinforcements are the most promising reinforcements; however, matrix materials have yet to reach reliability levels which would permit flight-certification of FRPs for primary structures. **MEASUREMENT OF PREFERENTIAL MOISTURE INGRESS IN COMPOSITE WING/SPAR JOINTS**
J. B. WHITESIDE, R. J. DELASI, and R. L. SCHULTE (Grumman Corporate Research Center, Bethpage, NY) (International Symposium on Composites: Materials and Engineering, University of Delaware, Newark, Sept. 24-28, 1984) Composites Science and Technology (ISSN 0266-3538), vol. 24, no. 2, 1985, p. 123-145. Research supported by Grumman Aerospace Corp. refs
(Contract F33615-78-C-3209)

The distribution of absorbed moisture was measured in three integral composite skin-to-spar joint concepts. The graphite/epoxy joint specimens were dried, exposed to heavy water vapor environment and sectioned. The method of nuclear reaction analysis was used to measure the distribution of absorbed moisture in the sectioned specimens. Two of the joint concepts had periodic fibrous reinforcement penetrating the skin: Kevlar stitches in one case and graphite tows in the other. In both cases the interior moisture concentrations in and around these stitches and tows were increased considerably above the corresponding interior moisture concentrations in areas remote from the stitches or tows. Measurements of absorbed moisture across the remote sections showed good agreement with Fickian diffusion distributions. The increased interior moisture level around the stitches is consistent with an interlaminar failure obtained in a previous hot-wet skin-spar shear test. Author

**EFFECT OF MEASURED MATERIAL PROPERTIES ON THE FINITE ELEMENT ANALYSIS OF AN OH-58 COMPOSITE TAIL BOOM**
L. M. BOWMAN Oct. 1985 28 p refs
(Contract DA PROJ. 1L1-61102-AH-45)
(NASA-TM-86430; L-15969; NAS 1.15:86430; AVSCOM-TR-85-B-5) Avail: NTIS HC A03/MF A01 CSCL 11D

A static and dynamic finite element analysis is conducted on a U.S. Army OH-58 composite tail boom and compared with test data. The tail boom is a filament-wound graphite/epoxy monocoque structure. The structural design of the composite tail boom skin is based on 50-percent graphite fiber volume. However, material tests on representative samples of the tail boom skin reveal that the graphite fiber-volume fraction varied from 44.6 to 49.3 percent. To determine the effect of using measured material properties, static and dynamic finite element analyses are conducted for three fiber-volume conditions of 45, 48, and 50 percent. The static and dynamic model with the 45-percent fiber-volume graphite skins gives the closest agreement with test data. Author

Ethylene glycol is used as a refrigerant for the intake air during simulated altitude testing. There have been some problems during these tests because of the ethylene glycol accidentally leaking into the inlet airstream. Since ethylene glycol has at times been suspected of interfering with the test article, its early detection would be greatly beneficial so that testing could be stopped before damage occurs. Because a detection scheme must indicate the presence of ethylene glycol as soon as it appears in the inlet airstream, a spectroscopic technique is preferred over other methods of gas analysis such as sampling and subsequent laboratory analysis. A study was conducted to determine if microwave spectroscopy techniques could be used to monitor the level of ethylene glycol in the inlet airstream to the Engine Test Facility (ETF) test cells during simulated altitude testing. The theory of microwave spectroscopy and the spectra of ethylene glycol are reviewed. Three separate designs of microwave spectrometers are presented which should be capable of monitoring ethylene glycol in the inlet airstreams with a sensitivity of at least 10 ppm. GRA

Advanced aircraft engine research within NASA Lewis is being focused on propulsion systems for subsonic, supersonic, and hypersonic aircraft. Each of these flight regimes requires different types of engines, but all require advanced materials to meet their goals of performance, thrust-to-weight ratio, and fuel efficiency. The high strength/weight and stiffness/weight properties of resin, metal, and ceramic matrix composites will play an increasingly key role in meeting these performance requirements. At NASA Lewis, research is ongoing to apply graphite/polyimide composites to engine components and to develop polymer matrices with higher operating temperature capabilities. Metal matrix composites, using magnesium, aluminum, titanium, and superalloy matrices, are being developed for application to static and rotating engine components, as well as for space applications, over a broad temperature range. Ceramic matrix composites are also being examined to increase the toughness and reliability of ceramics for application to high-temperature engine structures and components. Author

**METHODS OF CONSTRUCTING R-CURVES AND APPLICATION OF THESE CURVES FOR EVALUATION OF MATERIALS (REVIEW)**
G. S. NESHPOR, G. D. KUDRIAVTSEVA, and A. A. ARMIAGOV (Zavodskaia Laboratoriia, vol. 51, Jan. 1985, p. 64-73) Industrial Laboratory (ISSN 0019-8447), vol. 51, no. 1, July 1985, p. 74-85. Translation. refs

The theoretical background and methods for deriving the R-curve, i.e., the resistance of a material to stable crack growth, is reviewed, along with techniques for applying it to test materials. The R-curve is based on the assumption that the energy released during unstable crack growth is constant, although in some wide specimens plastic deformation at the crack tip will cause the rate of energy release to vary from that expected. The R-curve values are a function of the stress and the effective crack length. The stress value is determined for materials by tensile testing a center-cracked flat specimen, a side-cracked compact specimen and a specimen undergoing wedge loading along the crack line to derive load-displacement data. Sample calculations are carried out for sheets of a steel alloy. M.S.K.

**HIGH-TEMPERATURE THERMOCOUPLE AND HEAT FLUX GAUGE USING A UNIQUE THIN FILM-HARDWARE HOT JUNCTION**
C. H. LIEBERT, R. HOLANDA, S. A. HIPPENSTEELE, and C. A. ANDRACCHIO (NASA, Lewis Research Center, Cleveland, OH) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 938-944. Previously announced in STAR as N85-16096. refs
(ASME PAPER 85-GT-18)

A special thin film-hardware material thermocouple (TC) and heat flux gauge concept for a reasonably high temperature and high flux flat plate heat transfer experiment was fabricated and tested to gauge temperatures of 911 K. This concept was developed for minimal disturbance of boundary layer temperature and flow over the plates and minimal disturbance of heat flux through the plates. Comparison of special heat flux gauge Stanton number output at steady-state conditions with benchmark literature data was good and agreement was within a calculated uncertainty of the measurement system. Also, good agreement of special TC and standard TC outputs was obtained and the results are encouraging. Oxidation of thin film thermoelements was a primary failure mode after about 5 of operation. **LOCAL HEAT-TRANSFER MEASUREMENTS ON A LARGE SCALE-MODEL TURBINE BLADE AIRFOIL USING A COMPOSITE OF A HEATER ELEMENT AND LIQUID CRYSTALS**
S. A. HIPPENSTEELE, L. M. RUSSELL, and F. J. TORRES (NASA, Lewis Research Center, Cleveland, OH) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 107, Oct. 1985, p. 953-960. Previously announced in STAR as N85-33435. refs
(ASME PAPER 85-GT-59)

Local heat transfer coefficients were experimentally mapped along the midchord of a five-time-size turbine blade airfoil in a static cascade operated at room temperature over a range of Reynolds numbers. The test surface consisted of a composite of commercially available materials: a mylar sheet with a layer of cholesteric liquid crystals, that change color with temperature, and a heater sheet made of a carbon-impregnated paper, that produces uniform heat flux. After the initial selection and calibration of the composite sheet, accurate, quantitative, and continuous heat transfer coefficients were mapped over the airfoil surface. The local heat transfer coefficients are presented for Reynolds numbers from 2.8 x 10 to the 5th power to 7.6 x 10 to the 5th power. Comparisons are made with analytical values of heat transfer coefficients obtained from the STANS boundary layer code. Also, a leading edge separation bubble was revealed by thermal and flow visualization. Author

**F/A 18 COMPOSITE WING AUTOMATED DRILLING SYSTEM**
E. L. BOHANAN, JR. (McDonnell Aircraft Co., St. Louis, MO) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 579-585.

The key factors influencing the configuration and subsystems of the F/A-18 aircraft wing assembly Automated Drilling System (ADS) were the wide variety of fastener hole sizes generated in the composite/metallic material and the improved machining control parameters demanded by these advanced materials. Better cutters and more precise spindles than had been available with pneumatic drilling motors were also called for. ADS production implementation has furnished a cost-effective way of meeting present requirements without resort to hard tooling concepts. O.C.

### AGE CREEP FORMING IN AN AUTOCLAVE

D. M. HAMBRICK (Avco Corp., Avco Aerostructure Div., Nashville, TN) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 971-981.

Development of the autoclave forming aluminum process has advanced current technology of age forming. Using an autoclave for application of aging heat and forming pressure, the process has been used to form 50 feet long, 2124 and 2419 aluminum wing skins containing integrally machined stiffeners and varying in thickness from 0.1 to 2.5 inches with thick pads in the middle of thin sections. The process produces smooth contours with no visible signs of abrupt changes in thickness. The skins are believed to be the largest and most complex parts ever to be age creep formed in the history of the aircraft industry. Author

### NONDESTRUCTIVE TEST METHODS FOR COMPOSITE STRUCTURES

K. L. REIFSNIDER (Virginia Polytechnic Institute and State University, Blacksburg) IN: National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 1131-1142. refs

A comparative assessment is made among the three available structural NDT&E methods that are currently available for the response characteristics of missile airframe and space structure assemblies. In vibrothermography, a carefully chosen frequency is used to excite specific structural defects until a heat-pattern of dissipated energy is formed for imaging; structural discontinuities are thereby revealed. Stiffness changes can reflect material integrity and mechanical (especially vibratory) response. C-scan and acoustoultrasonic methods constitute the third family of methods considered. O.C.

**A86-13171**

### PREDICTION AND MEASUREMENT OF DAMPING OF VIBRATIONS OF STRUCTURES BY ADHESIVES

R. A. ELY and K. B. SANGHA (LTV Aerospace and Defense Co., Dallas, TX) IN: National SAMPE Symposium and Exhibition, 30th Anaheim, CA, March 19-21, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 1408-1418. refs

Attention is given to a method for the mathematical selection of adhesives to yield large vibration damping levels in structures, with emphasis on the major influences exerted by ambient temperature and mechanical excitation frequency on the selection of such adhesive damping treatments. In addition to laboratory tests and computer calculations aiding the development of adhesively damped components for aircraft structures, two examples of fighter aircraft components employing constrained adhesive layers are presented: a flap and a spoiler, which were chronically subject to pressure fluctuations. O.C.

### NEW METHODS OF MEASURING STRAIN AND TEMPERATURE IN A TURBINE ENGINE

W. A. STANGE (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) IN: International Congress on Experimental Mechanics, 5th, Montreal, Canada, June 10-15, 1984, Proceedings . Brookfield Center, CT, SESA, 1984, p. 565-570.

This paper presents an overview of current research efforts aimed at improving turbine engine structural instrumentation capabilities. Emphasis is placed on high temperature applications and improved sensor reliability. Technologies to be described include blade tip deflection sensors to determine dynamic stress, acoustic guided wave sensors to measure steady state strain, and double core fiber optics to measure both metal temperature and steady state strain. Advantages of the various systems, potential problems and limitations, as well as an assessment as to when the various technologies are likely to be ready for actual engine test usage are presented. Author

### EXPERIMENTAL/ANALYTIC COMPARISONS CONSIDERING COMPOSITE PANELS WITH A CUTOUT

A. N. PALAZOTTO, M. SABOTA (USAF, Institute of Technology, Wright-Patterson AFB, OH), and T. JANISSE (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: International Congress on Experimental Mechanics, 5th, Montreal, Canada, June 10-15, 1984, Proceedings . Brookfield Center, CT, SESA, 1984, p. 628-633.

The nonlinear finite element (STAGSC-1) program was used to calculate the values of radial displacement (RD) in a composite graphite/epoxy panel with a symmetrically positioned square cutout that is subjected to buckling loads of 2000, 2500, and 3300 lb. These RD values were compared with experimental measurements obtained under the defined conditions. The comparison shows the sensitivity of the panel to varying boundary conditions produced by the restraints associated with the experimental panel. A description of the techniques used for fabrication of composite cylindrical panels and application of the compressive load, and of the boundary conditions, as well as the STAGSC computer code, is included. I.S.

### APPLICATION OF COMPUTERIZED DATA ACQUISITION AND DATA PROCESSING TO THE SURFACE CONTOURING OF LARGE STRUCTURES

T. M. MILLY and A. HUNTER (Lockheed Research Laboratories, Palo Alto, CA) IN: International Congress on Experimental Mechanics, 5th, Montreal, Canada, June 10-15, 1984, Proceedings . Brookfield Center, CT, SESA, 1984, p. 795-799.

This paper deals with techniques and procedures for contouring relatively large surfaces using shadow and projection moire. The Experimental Strain Analysis Processing System (ESAPS), developed at LMSC, is then applied to these techniques to increase speed and efficiency of processing. In addition, the capability has been developed which provides for the examination of the overall contours of large areas as well as detailed localized contours. With systematically obtained contour data, interactive processing procedures provide for correlation analysis and accurate interpretation of incoming data. Author

### PANEL DESIGN FOR OPTIMUM STRENGTH AND STABILITY WITH ALLOWANCE FOR THE NONUNIFORMITY OF HEATING [PROEKTIROVANIE PANELEI PO USLOVIIAM PROCHNOSTI I USTOICHIVOSTI S UCHETOM NERAVNOMERNOGO NAGREVA]

G. P. GROSHEV and E. K. LIPIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 95-103. In Russian.

The problem of optimizing the design of a reinforced panel with respect to strength and stability is solved with allowance for the interaction of the panel with the flanges of the spars and wing ribs under conditions of nonuniform heating. It is shown that in the case of high total compressive forces in the root section of the wing, sections with heavy spar flanges can be used without a significant increase in weight in comparison with the wing sections having thermocompensated panels. V.L.

### AN ALGORITHM FOR CALCULATING THE COUPLING BETWEEN MATRICES OF ELASTIC INFLUENCE COEFFICIENTS FOR TWO SYSTEMS OF COMPUTATIONAL POINTS [ALGORITHM VYCHISLENIIA SVIAZI MATRITS UPRUGIKH KOEFFITSIENTOV VLIIANIIA V DVUKH RASCHETNYKH SISTEMAKH TOCHEK]

S. V. EFIMENKO TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 1, 1984, p. 133-136. In Russian.

The interpolation of a function of two variables by spline surfaces is used to calculate the elastic influence coefficients in a system of computational points on an elastic surface from the influence coefficients of a different system of points. To illustrate the approach proposed here, calculations are carried out for a cantilever plate. V.L.

**A86-13367**

### CONSIDERATION OF THE MULTIPLICITY OF CRITICAL SPOTS IN A STRUCTURE IN ESTIMATING THE DURABILITY AND THE SERVICE LIFE [UCHET MNOZHESTVENNOSTI KRITICHESKIKH MEST KONSTRUKTSII PRI OTSENKE GOLGOVECHNOSTI I RESURSA]

V. L. RAIKHER, A. F. SELIKHOV, and I. G. KHLEBNIKOVA TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 2, 1984, p. 72-81. In Russian. refs

An aircraft structure is treated as a system containing a large number of individual elements (stress raisers), and it is shown that, under certain assumptions, this approach makes it possible to obtain a statistical model for the service life of a structure. Such a model is proposed here for the case where the durabilities of individual elements can be considered to be independent and for the case where the individual durabilities are related in a certain manner. The validity of this approach is verified experimentally using several examples. The possible versions of the durability distribution function of an individual component are examined. V.L.

### AN EXPERIMENTAL STUDY OF A VACUUM WATER-AIR EJECTOR WITH A MULTICHANNEL LIQUID-SUPPLY NOZZLE ENSURING JET-PAIR COLLISION [EKSPERIMENTAL'NOE ISSLEDOVANIE VAKUUMNOGO VODOVOZDUSHNOGO EZHEKTORA S MNOGOSTVOL'NYM SOPLOM DLIA PODACHI ZHIDKOSTI, OBESPECHIVAIUSHCHIM POPARNOE SOUDARENIE STRUI]

IU. N. VASILEV, E. P. GLADKOV, and G. A. GORSHKOVA TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 45-54. In Russian.

Experimental results are reported for a vacuum water-air ejector with a cylindrical mixing chamber and a multichannel water-supply nozzle in which the axes of the adjacent channels are inclined relative to each other at a small angle, resulting in pair collisions of the jets in the mixing chamber and a more intense jet fractionation. A comparison with results obtained for an ejector using a water-supply nozzle with parallel channels shows that the collision of jets significantly increases the efficiency of the ejector. V.L.

**A86-13387**

### A PROPERTY OF THE ELASTIC VIBRATIONS OF NEARLY SYMMETRIC SYSTEMS [OB ODNOI OSOBENNOSTI UPRUGIKH KOLEBANII 'POCHTI SIMMETRICHNYKH' SISTEM]

IA. M. PARKHOMOVSKII TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 99-106. In Russian.

It is shown that a slight asymmetry of the mass and stiffness characteristics of an aircraft relative to a vertical plane intersecting the longitudinal axis of the aircraft can sometimes cause essentially asymmetric vibrational modes. In particulaiar, this is true of the torsional modes of the wings. The mechanism of this phenemenon is illustrated by a model problem. V.L.

### A MODEL FOR THE LIFE VARIANCE OF A STRUCTURAL ELEMENT UNDER IRREGULAR LOADING [MODEL' RASSEIANIIA DOLGOVECHNOSTI ELEMENTA KONSTRUKTSII PRI NEREGULIARNOM NAGRUZHENII]

A. F. SELIKHOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 3, 1984, p. 107-120. In Russian. refs

A life variance model developed in an earlier study (Selikhov, 1984) for regular loading is extended to the case of irregular loading. By using the formalism of individual fatigue damage curves for true stresses at the highest-load point, an expression for the life variance is obtained for the case where the relative cycle number based on nominal stresses is not equal to unity. The model proposed here explains certain characteristics of life variance under conditions of irregular loading. V.L.

**A86-13410**

### USING ISOPERIMETRIC INEQUALITIES FOR THE TWO-SIDED ESTIMATION OF THE TORSIONAL STIFFNESS OF A PRISMATIC BAR [PRIMENENIE IZOPERIMETRICHESKIKH NERAVENSTV DLIA DVUKHSTORONNEI OTSENKI ZHESTKOSTI KRUCHENIIA PRIZMATICHESKOGO STERZHNIA]

V. V. EGOROV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 4, 1984, p. 120-123. In Russian.

A formula is proposed which makes it possible to obtain the upper and lower bounds for the torsional stiffness of a prismatic bar from two geometrical parameters of its cross-section, the perimeter and the area. This formula can be used to determine the trend of the change of the cross-sectional torsional stiffness for any change in the shape of the cross-section (e.g., in the case of cross-section reinforcement or replacement of one cross-section by another). V.L.

**A86-13419**

### ALLOWANCE FOR INITIAL CONDITIONS IN STATIC AND DYNAMIC CALCULATIONS OF STRUCTURES BY THE FINITE ELEMENT METHOD [UCHET NACHAL'NYKH USILII V STATICHESKIKH I DINAMICHESKIKH RASCHETAKH KONSTRUKTSII METODOM KONECHNYKH ELEMENTOV]

V. P. AGAPOV, V. D. ILICHEV, V. A. KOROTKOV, and A. V. STRELIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 79-89. In Russian. refs

The influence of initial conditions on the stiffness characteristics of aircraft structures in static and dynamic calculations is examined. A method for including initial conditions in the finite element method is described, with particular attention given to a procedure for obtaining the initial-stress matrix for a plane triangular element. The accuracy of the method is illustrated by model problems, and calculation results for the natural vibrations of a propeller are compared with experimental data. B.J.

**CERTAIN PROBLEMS OF FLUID FLOW NEAR THE CORE OF A SPIRAL DISCONTINUITY [NEKOTORYE ZADACHI O TECHENII ZHIDKOSTI V OKRESTNOSTI IADRA SPIRAL'NOGO RAZRYVA]**
A. M. GAIFULLIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 125-131. In Russian. refs

The structure of the core of a vortex sheet is analyzed in flows that are only slightly different from self-similar ones; on a low-aspect-ratio delta wing this corresponds to a slight curvature of the vortex-sheet axis. Also investigated is the structure of the core of a vortex sheet and a free boundary in axisymmetric self-similar flows. A comparison is made with the two-dimensional case. B.J.

**A86-13430**
**SEPARATED FLOW PAST A SHARP EDGE ACCORDING TO A REVERSE-JET SCHEME [OTRYVNOE OBTEKANIE OSTROI KROMKI PO SKHEME S VOZVRATNOI STRUIKOI]**
L. A. KOZHURO TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 6, 1984, p. 10-18. In Russian. refs

A solution is obtained to the problem of separated incompressible inviscid flow past a sharp edge according to Efros' scheme in the limiting case of an infinite velocity at the free streamline. The rate of change in reverse-jet momentum remains finite and is equal to the suction force acting on the sharp edge in the case of nonseparated flow. A finite concentrated force acts on the edge in a direction perpendicular to the action of the suction force. Attention is given to the limit state for flow past a plate at angle of attack with separation at the leading edge, when the velocity at the free streamline tends to infinity. B.J.

**CUTOUTS IN LOAD-BEARING STRUCTURES [VYREZY V NESUSHCHIKH KONSTRUKTSIIAKH]**
I. N. PREOBRAZHENSKII and I. A. TSURPAL Moscow, Izdatel'stvo Mashinostroenie, 1984, 112 p. In Russian. refs

Data are presented on the stability, natural frequencies, and stress distributions of the critical parts of machines and structural elements near holes, cavities, and other types of abrupt changes in the cross-section. The effect of various factors on stress concentration is estimated for different types of structures and materials. In particular, attention is given to the effect of reinforcing elements, the effect of material anisotropy, dynamic problems, the effect of the viscoelastic properties of materials on stress distribution near holes, and nonlinear problems of stress concentration. V.L.

**THE EFFECT OF THE DEFLECTOR TYPE ON INTERNAL HEAT TRANSFER IN BLADES WITH TRANSVERSE COOLANT FLOW [VLIIANIE TIPA DEFLEKTORA NA VNUTRENNII TEPLOOBMEN V LOPATKAKH S POPERECHNYM TECHENIEM OKHLADITELIA]**
A. N. BOIKO, M. N. GALKIN, S. Z. KOPELEV, and I. V. SHEVCHENKO (Moskovskii Aviatsionnyi Tekhnologicheskii Institut, Moscow, USSR) Promyshlennaia Teplotekhnika (ISSN 0204-3602), vol. 7, no. 4, 1985, p. 42-46. In Russian.

The internal heat transfer characteristics of a deflector blade are determined by liquid-metal thermostat calorimetry. The coefficients of heat transfer to the cooling air are obtained for the mean blade cross-sectional area for three types of deflectors. It is found that in deflector plates with slots or round nozzles, the cooling intensity of the inlet edge is a factor of 1.6-1.9 higher than in blades with transverse cuts. V.L.

**COMPUTATION OF AERONAUTICAL STRUCTURES [CALCULUL STRUCTURILOR DE AVIATIE]**
A. PETRE Bucharest, Editura Tehnica, 1984, 368 p. In Romanian. refs

The book presents both the classical and modern computational methods of aircraft structures. After a brief historical review of aviation, the general design and stress-strain problems are exposed. Aerodynamic principles, loads, shell structures, buckling, reliability, post-buckling behavior and plates and bars are covered in detail. A section on optimization problems ends the classical study. The modern section starts with the matrix methods, discusses the finite element method and concludes with a structural synthesis and optimization theory. The book is of interest to the academic world as well as to engineers and designers working in the aeronautical field. N.D.

**WEIGHT OPTIMIZATION OF STIFFENED CYLINDERS UNDER AXIAL COMPRESSION**
R. QIU Computers and Structures (ISSN 0045-7949), vol. 21, no. 5, 1985, p. 945-952. refs

A procedure is developed for the design of a stiffened cylinder under a given uniform axial compression with minimum weight. The approach allows the consideration of various shapes of stiffening members. The effective stiffness of the skin in its post-buckled state is taken into account in the basic analysis. The buckling analyses are accomplished as a minimum problem in the buckling mode shape parameters space using the variable metric method. A mixed procedure which combines the exterior penalty function concept and random search is used to minimize the weight of the stiffened cylinders. The design examples demonstrate the validity of the present approach. Author

**FORGING IN THE AEROSPACE INDUSTRY [LE FORGEAGE DANS L'INDUSTRIE AEROSPATIALE]**
N. BEAUCLAIR Air et Cosmos (ISSN 0044-6971), vol. 23, Oct. 19, 1985, p. 19-21, 23-27, 29. In French.

The recent recession slowed the rate at which foundaries could afford to invest in plant modernization. Modernization, i.e. CAD/CAM and net-shape forming of metals, is a necessity in order to control the costs of delivered products, which for aerospace applications usually require a high degree of precision in the stamping and forging processes. The new manufacturing techniques are currently applied in working with specialty steels, Ni, Ti and Al alloys, and will necessarily be extended to cover superalloys. Some relief is being experienced by the subcontractors due to the demand for the delivery of eight Airbus aircraft per month, along with a number of Mirage 2000 aircraft. Production of the Airbus has not, thus far, surpassed 4.5 per month. M.S.K.

**PRECISION CASTING AT ROLLS-ROYCE**
R. J. SOUTHGATE Metals and Materials (ISSN 0266-7185), vol. 1, Oct. 1985, p. 602-604, 606.

A development history and status account is presented for near-net shape, high precision aircraft engine component casting methods employed by a major manufacturer of high bypass turbofans for commercial aircraft. The complexity of such components as gas turbine blades is so great that an elaborate assembly of small and fragile ceramic cores must be inserted in the pattern die before closure and wax injection. Molds used for single crystal or directionally solidified superalloy castings differ from conventional types in that openings must be provided for the fitting of a chill plate. Ceramic shell molding techniques are also used for high temperature engine components. Attention is given to the industrial apparatus, including process and quality control elements, that have been developed by the manufacturer. O.C.

**OPTICAL COMMUNICATION BETWEEN AIRCRAFT IN LOW-VISIBILITY ATMOSPHERE USING DIODE LASERS**

A. K. MAJUMDAR (Lockheed-California Co., Kelly Johnson Research and Development Center, Burbank, CA) Applied Optics (ISSN 0003-6935), vol. 24, Nov. 1, 1985, p. 3659-3665. Research supported by the Lockheed-California Co. refs

The performance of an atmospheric optical communication link using multiple-forward-scattered (MFS) radiation is examined theoretically and experimentally. In particular, results of a laboratory-simulation experiment are used to estimate beam spread/angular spread angle in terms of channel coherence length, rms forward scatter angle, and forward-scattering efficiency, with a GaAlAs laser diode (0.8486 micron) used as a source. A pulse-position-modulation format is then considered, and the minimum field of view which optimizes the system margin for given data rate, low-visibility atmospheric parameter, and background condition is determined. The feasibility of acquisition and high-rate-data transfer between aircraft through low-visibility atmosphere is shown to be feasible. This can provide a relatively covert system with high immunity to jamming. V.L.

**DYNAMIC RESPONSE OF A LAMINATED PLATE WITH FRICTION DAMPING**

S. Z. HAN (Chinese Academy of Sciences, Institute of Mechanics, Beijing, People's Republic of China) ASME, Transactions, Journal of Vibration, Acoustics, Stress, and Reliability in Design (ISSN 0739-3717), vol. 107, Oct. 1985, p. 375-377.
(ASME PAPER 85-DET-16)

A sandwich-type plate with metal facings and felt core, fastened by bolts, was studied using both test and finite-element analysis. This type of plate is cheap, light, damping-effective and without pollution; therefore, it is widely used in astronautical engineering. The tests were conducted for different felt thicknesses, bolt numbers, and fastening forces. The results show that the damping depends on friction between the plates and the felt. As compared with an identical stiffness solid plate, the damping of laminated plates can be increased up to 30 times. A mesh with rectangular elements was adopted in the finite-element analysis. In accordance with the slipping mechanism, a rectangular plate clamped on one edge was analyzed with the foregoing elements to determine the resonant frequency and the damping. The difference between the calculated and tested results was within 5 percent for the resonant frequency. Author

**ROTOR DYNAMICS EQUATIONS IN COMPLEX FORM**

H. D. NELSON (Arizona State University, Tempe) ASME, Transactions, Journal of Vibration, Acoustics, Stress, and Reliability in Design (ISSN 0739-3717), vol. 107, Oct. 1985, p. 460, 461. refs

For a number of years, the finite element method of modeling rotor dynamic systems has been employed extensively. A presentation of rotor system equations in a complex form is convenient for some applications. The present note has the objective to provide the complex form of the rigid disk, finite rotating shaft element, and general linear bearing equations of motion. Order reduction by static condensation, assembly of the system equations, and analysis procedures, are carried out in the same manner as described by Ruhl and Booker (1972), Nordman (1974), and Nelson and McVaugh (1976). G.R.

**APPLICATION OF PULSED REFLECTION HOLOGRAPHY TO MATERIAL TESTING**

R. L. VAN RENESSE and J. W. BURGMEIJER (Centrale Organisatie voor Toegepast-Natuurwetenschappelijk Onderzoek, Delft, Netherlands) Optical Engineering (ISSN 0091-3286), vol. 24, Nov.-Dec. 1985, p. 1086-1092. Research supported by Rijksverdedigingsorganisatie voor Toegepast-Natuurwetenschappelijk Onderzoek. refs

A processing technique resulting in high quality reflection holograms is described. The pulse reflection holograms produced may be analyzed by microscope up to interference fringe densities of about 30 fringes/mm. An experimental study using the holographic technique for the detection of fatigue crack growth in a critical aircraft structure is discussed. Low-noise high-efficiency Denisyuk (1963) phase reflection holograms can be produced by the technique. Holograms of a quality sufficient for the convenient interferometric evaluation of low-diffuse reflectance objects are obtained. In addition, the technique provides a low emulsion shrinkage, making possible shrinkage manipulation and thus reconstructed-color manipulation. Rigid-body motion problems are readily solved if the plate holder is fixed to the object. Finally, sensitivity to in-plane as well as out-of-plane deformation is obtained through the observation of different angles of the objects. F.J.

Recently abroad in connection with rapid development of radar technology methods and means of antiradar protection of flight vehicles, which facilitate breach/inrush of aircraft and rockets through lines of air defense intensively are developed/processed. On the intensification of works in this direction it is possible to judge a sharp increase in the expenditures of USAF (United States Air Force) for the development of the combat means with radar - with 35.5 million dollars in 1962 to 119 million dollars in 1963 and 155 million dollars each in 1964. Utilization of radio-absorbing materials, which ensure decrease of effective surface of scattering of aircraft and rockets, is one of effective combat means with radar. GRA

### NUMERICAL AND EXPERIMENTAL STUDIES OF 3-D AND UNSTEADY TURBULENT BODY/APPENDAGE/PROPELLER FLOWS Annual Report, No. 2, 15 May 1984 - 14 May 1985

J. A. SCHETZ and R. L. SIMPSON 15 Jun. 1985 56 p
(Contract N00014-83-K-0372)
(AD-A157078) Avail: NTIS HC A04/MF A01 CSCL 20D

The 3-D, turbulent flowfield produced by a propeller operating in the wake of a variable mesh disk has been studied with numerical solutions of the Reynolds-averaged, Navier-Stokes equations and by detailed experiments in a wind tunnel. The mesh variations of the upstream disk were chosen to produce a simulation of the wake of a streamlined, axisymmetric body with a single, streamlined appendage. Comparisons of measurements and preliminary numerical predictions show good agreement for the velocity profiles behind the propeller. The 3-D flow in the junction between a cylindrical appendage and a hull can produce separation of the trailing portion of the appendage and produces a momentum deficient 3-D boundary layer that is more prone to detachment than the 2-D regions away from the appendage. Detailed measurements of the zero-pressure-gradient boundary layer upstream of an appendage of interest have been made. A procedure has been developed for reducing blockage effects in the test wind tunnel. GRA

### OPTICAL TECHNIQUE TO STUDY THE IMPACT OF HEAVY RAIN ON AIRCRAFT PERFORMANCE Final Report

C. F. HESS and F. LI Oct. 1985 43 p refs
(Contract NAS1-17932)
(NASA-CR-177989; NAS 1.26:177989; SDL-85-2424-1F) Avail: NTIS HC A03/MF A01 CSCL 01C

A laser based technique was investigated and shown to have the potential to obtain measurements of the size and velocity of water droplets used in a wind tunnel to simulate rain. A theoretical model was developed which included some simple effects due to droplet nonsphericity. Parametric studies included the variation of collection distance (up to 4 m), angle of collection, effect of beam interference by the spray, and droplet shape. Accurate measurements were obtained under extremely high liquid water content and spray interference. The technique finds applications in the characterization of two phase flows where the size and velocity of particles are needed. Author

### TRANSIENT TEST OF SUSPENSION ELECTRONICS FOR GYROSCOPE Patent Application

P. H. ITO, inventor (to Air Force) 8 Jul. 1985 48 p
(AD-D011853; US-PATENT-APPL-SN-752767) Avail: NTIS HC A03/MF A01 CSCL 17G

The rotor suspension electronics of an electrostatic gyro suspension system is required to perform flawlessly to sustain the life of the gyro. Transient abnormalities as short as one millisecond duration will cause the spinning rotor to come in contact with the surrounding electrodes and result in destruction of the gyro. Thus, not infrequently after a catastrophic dropped rotor incident no trace of the fault is evident upon ensuing check of the system. To remedy this problem a built in test (BIT) system is used to provide fault isolation. The test circuitry is built into the navigation system electronics and integrated with the system program. The fault isolation electronics comprise sensor circuits to monitor functional subdivisions of the electronic suspension system for signal abnormality and a processing circuit which receives the sensor circuit outputs and identifies the primary source of the fault. The faults are detected and the source is flagged at the time of occurrance. The output of the fault isolation electronics is a latched coded readout which is fed to the navigation computer for memory storage and any appropriate follow-up system action, such as power shutdown. After initialization by the computer, the fault isolation function is an automatic operation by the electronic circuitry. Author (GRA)

### NEW PASSIVE HELICOPTER DETECTOR

G. R. ELLIOTT 1985 7 p Presented at the 26th Ann. Meeting of the Inst. of Nucl. Mater. Management, Albuquerque, N. Mex., 21; Jul. 1985
(Contract DE-AC04-76DP-00789)
(DE85-015160; SAND-85-1670C; CONF-850765-9) Avail: NTIS HC A02/MF A01

Sandia has developed a new helicopter detector. The device relies on the correlation between the acoustic wave from the helicopter and the resulting coupled seismic wave. A significant feature of this approach is that the detector is completely passive; there is no radio frequency radiation. Intended for deployment as a perimeter sensor around a site, the unit offers a low nuisance/false alarm rate and a high probability of detection for a wide range of helicopters. Reliable detection occurs when the target is at high altitude and also very near the earth's surface. Detection ranges start at one kilometer for the small, four-place, civilian helicopter and approach five kilometers for heavier, military types. The system has two parts: a transducer package containing a micrphone and a geophone and a digital processor. Development is underway for a model which will be AC powered and well suited to permanent facilities. A prototype unit using a lightweight, battery powered processor is being constructed for rapid-deployment applications. DOE

### DEVELOPMENT AND EVALUATION OF A MICROBURST TEST APPARATUS FOR USE AS A MINIMUM DESTRUCTIVE TEST FOR PARACHUTE MATERIAL

G. T. EGGLESTONE, N. M. BROWNE, and M. TAYLOR Apr. 1985 33 p
(AD-A158110; MRL-R-959) Avail: NTIS HC A03/MF A01 CSCL 11E

Conventional testing of parachute canopy materials to identify the extent of polymer degradation requires large amounts of material resulting in extensive repairs if the material is found to be sound. A microburst test apparatus designed and built at the Materials Research Labs is capable of testing the canopy in-situ, with a degree of damage confined to a 3.2 mm diameter hole. This does not require repair and fits between a ripstop repeat on canopy material from modern day T-1 0 parachutes. The microburst unit gives a digital readout for maximum pressure to burst and pressure to burst/time integral. Correlations between these results and those from conventional tensile and Mullens burst tests showed the microburst test results to more closely resemble those from accepted tensile test methods. ### HEAT TRANSFER AND PRESSURE DROP PERFORMANCE OF A FINNED-TUBE HEAT EXCHANGER PROPOSED FOR USE IN THE NASA LEWIS ALTITUDE WIND TUNNEL

G. J. VANFOSSEN Nov. 1985 27 p refs
(NASA-TM-87151; E-2623; NAS 1.15:87151) Avail: NTIS HC A03/MF A01 CSCL 20D

A segment of the heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel (AWT) facility has been tested under dry and icing conditions. The heat exchanger has the largest pressure drop of any component in the AWT loop. It is therefore critical that its performance be known at all conditions before the final design of the AWT is complete. The heat exchanger segment is tested in the NASA Lewis Icing Research Tunnel (IRT) in order to provide an icing cloud environment similar to what will be encountered in the AWT. Dry heat transfer and pressure drop data are obtained and compared to correlations available in the literature. The effects of icing sprays on heat transfer and pressure drop are also investigated. **FLUID FORCES ON TWO CIRCULAR CYLINDERS IN CROSSFLOW**

J. A. JENDRZEJCZYK and S. S. CHEN Jun. 1985 60 p
(Contract W-31-109-ENG-38)
(DE85-014294; ANL-85-35) Avail: NTIS HC A04/MF A01

Fluid excitation forces are measured in a water loop for two circular cylinders arranged in tandem and normal to flow. The Strouhal number and fluctuating drag and lift coefficients for both cylinders are presented for various spacings and incoming flow conditions. Results show the effects of Reynolds number, pitch ratio, and upstream turbulence on the fluid excitation forces. DOE

**CRUSHING STRENGTH OF ALUMINUM OXIDE AGGLOMERATES Final Report, Apr. 1983 - Sep. 1984**

R. A. GAMBLE Jul. 1985 40 p Prepared in cooperation with Sverdrup Technology, Inc., Arnold AFS, TN
(AD-A158051; AEDC-TR-85-16) Avail: NTIS HC A03/MF A01 CSCL 20K

Aluminum oxide, which is formed during combustion of aluminum-based solid propellants, condenses and solidifies in the exhaust flow to form sub-micron-size particles, which may then adhere together to form agglomerates. Particle sampling, which is required for motor performance or environmental impact investigations, is usually done using a probe placed in the supersonic exhaust flow field. The bow shock at the sample probe inlet will decelerate the gas flow which introduces a large velocity differential between the gas and particulate. This differential will result in a sudden increase on the aerodynamic drag on the agglomerates which may cause them to shear apart, thus altering the sample size distribution. In this effort, aluminum oxide agglomerates were formed and then crushed in order to estimate the magnitude of the interparticle forces binding the agglomerate together. The agglomerates were formed by tumbling commercially available aluminum oxide powder in a container, and strength was determined by measuring the load required to crush the agglomerate between two flat plates. Analysis indicated that through, uniformly-shaped particles formed the strongest agglomerates. The experimentally-derived particle bonding forces were in agreement with values predicted by the van der Waal force equation for closely-spaced spheres. Rocket exhaust particulates collected from a test facility exhaust processing system proved to be unstable because of impurities. GRA

**WAVES DUE TO A STEADILY MOVING SOURCE ON A FLOATING ICE PLATE**

J. W. DAVYS, R. J. HOSKING, and A. D. SNEYD (Waikato, University, Hamilton, New Zealand) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 158, Sept. 1985, p. 269-287. refs

The propagation of flexural waves in floating ice plates is governed by two restoring forces - elastic bending of the plate, and the tendency of gravity to make the upper surface of the supporting water horizontal. This paper studies steady wave patterns generated by a steadily moving source on a water-ice system that is assumed to be homogeneous and of infinite horizontal extent, using asymptotic Fourier analysis to give a simple description of the wave pattern far from the source. Short-wavelength elastic waves propagate ahead, while the long gravity waves appear behind; and, depending on the system parameters, one, two, or no caustics may appear. Wavecrest patterns are shown, and the amplitude variation with direction from the source is given. Where the two caustics just merge together, a special mathematical function analogous to the Airy function is introduced to describe wave amplitudes. These waves can be detectd by a strainmeter embedded in the ice, and its theoretical response is compared with some experimental measurements. Author

**MICROBURSTS - A HAZARD FOR AIRCRAFT**

P. F. LINDEN and J. E. SIMPSON (Cambridge University, England) Nature (ISSN 0028-0836), vol. 317, Oct. 17, 1985, p. 601, 602. refs

Laboratory experiments are reported which show that when a descending column of dense fluid reaches the ground and begins to spread out horizontally, an intense vortex with a horizontal axis forms at the leading edge of the outflowing air. The intensity of this vortex results from the increase in vorticity due to the rapid stretching of the length of the leading edge. The properties of such a horizontal vortex with its associated updrafts and downdrafts are consistent with those found in microbursts, which are a severe hazard to aircraft when taking off or landing. C.D.

Future large AF electrical generator channels will be required to operate in parallel to supply single large loads. These channels will be required to use a minimum number of conversion stages to maintain the highest possible efficiency. The EW or other large loads will use power converted directly from the variable speed generator, and only that power required to be 400-Hz will be converted by the V.S.C.F. unit. Redundancy for one generator out condition will be required. The protection and control of the parallel bus will require more sophistication and complexity than the systems presently available. Large rating generators, contactors, and distribution systems will require design effort and test. This report covers a design study to meet the requirements of advanced high power EW systems for aircraft. This report covers the design of a 50 kVA, six-phase generator which is spray oil cooled. The output ratings are 60 kVA at 53% speed, 120 kVA at 60% speed and 410 kVA above 83% speed. The generator maximum design speed is 15,000 rpm. GRA

**THE HELICOPTER TO FIXED WING CONVERSION PROGRAM: A CRITICAL REVIEW**
L. T. MASSEY Apr. 1985 39 p
(AD-A156820; ACSC-85-1750) Avail: NTIS HC A03/MF A01 CSCL 05I

USAF helicopter pilots are initially trained by the U.S. Army through their undergraduate helicopter pilot training program. Four to seven years later, some of these pilots have the opportunity to convert to fixed wing aircraft via the fixed wing conversion program currently conducted by sending selected helicopter pilots through Air Force undergraduate pilot training. This study reviews these programs and assesses the impact this training philosophy has on career opportunities for helicopter pilots, both for those who convert to fixed wing systems, as well as for those who remain in helicopters. Two alternatives are presented which would resolve the problems identified. The study concludes that the USAF could provide better career opportunities for helicopter pilots, as well as improve experience levels in the helicopter force, by enacting changes to current training programs. **CRITERIA FOR A STATE-OF-THE-ART VISION TEST SYSTEM Final Report**
K. MOFFITT and L. V. GENCO May 1985 109 p
(Contract F33615-82-C-0511)
(AD-A157099; AFAMRL-TR-85-004) Avail: NTIS HC A06/MF A01 CSCL 06P

Many vision test/screening devices used in the Armed Services have not changed since the 1940's. The reduction in the size of the pool of qualified aircrew candidates has caused operational Commands to question the validity of these tests. Current objectives of vision testing have evolved from a means to eliminate pilot candidates to methods of predicting aircrew performance. The Naval Aerospace Medical Research Laboratory (NAMRL) is attempting to correlate the results of several vision tests with the visual abilities of pilot trainees as demonstrated during monitored training flights. This report describes status that could be considered as useful parameters for testing in the Armed Forces vision test battery of the future. One major conclusion is that the operational visual task(s) must be suitably described in order to select appropriate clinical and laboratory test measures. Correlations and validation studies can then be performed with cooperative efforts such as those between NAMRL and AFAMRL. GRA

**PILOT-ORIENTED PERFORMANCE MEASUREMENT Final Report, Jan. - Dec. 1983**
J. DEMAIO, H. H. BELL, and J. BRUNDERMAN Aug. 1985 15 p
(Contract AF PROJ. 2313)
(AD-A158849; AFHRL-TP-85-18) Avail: NTIS HC A02/MF A01 CSCL 14B

Aircrew performance measurement is a critical problem in evaluating the quality of a visual simulation system and in determining the effectiveness of aircrew training devices. An effective performance measurement system must be able to separate performance into appropriate components and describe the relationship of these components. This paper describes a performance measurement system developed to analyze pilot performance in maintaining altitude in both straight and turning flight as a function of the object density of the simulated visual environment. The analysis indicates that pilot performance can be divided into perceptual and task difficulty factors and that the effect of the visual environment on each of these factors can be determined. A prototype performance measurement system was developed to describe pilot performance in a simulator. The pilot's task was to maintain altitude at 200 feet both in straight and in turning flight. Pilot performance was sensitive to task difficulty and to visual scene quality. The strength of this performance measurement system was that it analyzed performance in terms of overall task performance and also specific pilot control inputs. GRA

**EFFECTS OF DIGITAL ALTIMETRY ON PILOT WORKLOAD**
R. L. HARRIS, SR. and B. J. GLOVER Nov. 1985 20 p refs
(NASA-TM-86424; L-15989; NAS 1.15:86424) Avail: NTIS HC A02/MF A01 CSCL 05H

A series of VOR-DME instrument landing approaches was flown in the DC-9 full-workload simulator to compare pilot performance, scan behavior, and workload when using a computer-drum-pointer altimeter (CDPA) and a digital altimeter (DA). Six pilots executed two sets of instrument landing approaches, with a CDPA on one set and a DA on the other set. Pilot scanning parameters, flight performance, and subjective opinion data were evaluated. It is found that the processes of gathering information from the CDPA and the DA are different. The DA requires a higher mental workload than the CDPA for a VOR-DME type landing approach. Mental processing of altitude information after transitioning back to the attitude indicator is more evident with the DA than with the CDPA. E.A.K.

**ALERTED MONITORS: HUMAN OPERATORS AIDED BY AUTOMATED DETECTORS Final Report**
R. D. SORKIN and D. E. ROBINSON Dec. 1984 55 p
(Contract DTRS56-83-C-00047)
(PB85-222750; DOT/OST/P34-85/021) Avail: NTIS HC A04/MF A01 CSCL 05H

In an alerted monitor system, an automated detector assists a human operator in the detection and diagnosis of problems occurring in some monitored process. Air traffic control centers and the flight decks of commercial aircraft include many examples of such systems. This project developed a general model of the altered-monitor system and evaluated the effects on system performance of interactions between the human operator and automated detector. One of the types of interaction evaluated (contingent criterion strategy) yields optimal performance from the combined person-machine system. Two laboratory experiments were performed to evaluate the assumptions of the model and the interactions between the operator and automated components. GRA

**A METHOD FOR ARRANGING NODES ALONG THE LINES OF A COMPUTATIONAL GRID DURING THE NUMERICAL SOLUTION OF PROBLEMS IN MATHEMATICAL PHYSICS [METOD RASSTANOVKI UZLOV VDOL' LINII SCHETNOI SETKI PRI CHISLENNOM RESHENII ZADACH MATEMATICHESKOI FIZIKI]**

V. L. IUMASHEV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 4, 1984, p. 115-119. In Russian.

Automatic grid generation during the numerical solution of problems in mathematical physics involves the problem of node arrangment along an arbitrary line in accordance with a given criterion. A numerical method for solving this problem is proposed which can be used in a sufficiently general case where the line and the node arrangement criterion are given in the form of certain computational procedures rather than in analytical form. The method is illustrated by an example in which a grid is constructed for a body with a variable-width elliptical cross-section representing a flight vehicle model. V.L.

**A86-13418**

**APPLICATION OF THE STATE-SPACE METHOD TO ANALYZE THE STABILITY OF DIGITAL SYSTEMS [PRIMENENIE METODA PROSTRANSTVA SOSTOIANII DLIA ANALIZA USTOICHIVOSTI TSIFROVYKH SISTEM]**

IU. I. DIDENKO, P. V. KUSHNIR, and IU. F. SHELIUKHIN TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 68-78. In Russian. refs

Methodological questions involving the use of state equations to analyze the stability of complex digital systems are examined. Consideration is given to delay in the feedback circuits, the use of several reception beats of input information, and the renewal of the state-vector components of the digital controlling part. Generalized matrix expressions describing the behavior of such systems are obtained. A digital flight control system is considered as an example. B.J.

**EXPERT SYSTEMS AND THEIR USE IN AUGMENTING DESIGN OPTIMIZATION**

G. H. KIDWELL and M. A. ESKEY (NASA, Ames Research Center, Moffett Field, CA) AIAA, AHS, and ASEE, Aircraft Design Systems and Operations Meeting, Colorado Springs, CO, Oct. 14-16, 1985. 16 p. refs

(AIAA PAPER 85-3095)

The challenging requirements that are evolving for future aircraft demand that each design be optimally integrated, for the penalties imposed by nonoptimal performance are significant. Classic numerical optimization algorithms have been and will continue to be important tools for aircraft designers. These methods are, however, limited to certain categories of aircraft design variables, leaving the remainder to be determined by the user. A method that makes use of knowledge-based expert systems offers the potential for aiding the conceptual design process in a way that is similar to that of numerical optimization, except that it would address discrete, discontinuous, abstract, or any other unoptimized aspect of vehicle design and integration. Other unique capabilities such as automatic discovery and learning in design may also be achievable in the near term. This paper discusses current practice in conceptual aircraft design and knowledge-based systems, and how knowledge-based systems can be used in conceptual design. Author

**A86-14827**

**UNCERTAINTY AND CONTROL - SOME ACTIVITIES AT DFVLR**

G. GRUEBEL (DFVLR, Institut fuer Dynamik der Flugsysteme, Oberpfaffenhofen, West Germany) IN: Uncertainty and control; Proceedings of the International Seminar, Bonn, West Germany, May 1985 . Berlin and New York, Springer-Verlag, 1985, p. 1-47. refs

Some activities at DFVLR which deal with system modelling and performance evaluation under uncertainty, as well as feedback control applications, are reported. Activities in applied nonlinear parameter identification, on-line wind measurement and prediction, stochastic simulation, and sensor diagnosis via analytic redundancy are briefly described. Applications of feedback control are examined, including model-following control for inflight simulation, robust stabilization of high-performance aircraft, aircraft flutter stability augmentation via active mode decoupling, and active damping of mechanical lightweight structures based on finite element modelling. C.D.

**A86-14830**

**MULTI-MODEL APPROACHES TO ROBUST CONTROL SYSTEM DESIGN**

J. ACKERMANN (DFVLR, Institut fuer Dynamik der Flugsysteme, Oberpfaffenhofen, West Germany) IN: Uncertainty and control; Proceedings of the International Seminar, Bonn, West Germany, May 1985 . Berlin and New York, Springer-Verlag, 1985, p. 108-130. refs

The design of fixed-gain, robust controllers is reviewed. Two design methods are considered: (1) the simultaneous assignment of the poles to a given region for all members of the plant family by parameter space methods, and (2) the interactive Pareto optimization of a vectorial performance index. The testing of the controller for parameter uncertainty in continuous intervals is examined. The existence and dynamic order of simultaneous Gamma stabilizers is discussed. C.D.

**APPLICATIONS OF ARTIFICIAL INTELLIGENCE; PROCEEDINGS OF THE MEETING, ARLINGTON, VA, MAY 3, 4, 1984**

J. F. GILMORE, ED. (Georgia Institute of Technology, Atlanta) Meeting sponsored by SPIE - The International Society for Optical Engineering. Bellingham, WA, SPIE - The International Society for Optical Engineering (SPIE Proceedings. Volume 485), 1984, 243 p. For individual items see A86-15279 to A86-15285.

(SPIE-485)

Subjects related to expert systems are discussed, taking into account a context dependent automatic target recognition system, computer understanding of air traffic control displays, the role of the image analyst in computer vision, a demonstration of an ocean surveillance information fusion expert system, and the location of multiple faults by diagnostic expert systems. Other topics explored are concerned with knowledge-based systems, autonomous vehicles, and image understanding. Attention is given to aspects of interfacing an intelligent decision-maker to a real-time control system, a reasoning system for computer aided engineering, an 'intelligent' optical design program, an adaptive interpolator algorithm for area-array fine guidance sensors, terrain navigation concepts for autonomous vehicles, the autonomous helicopter system, an autonomous vehicle navigation algorithm, the planning of strategic paths through variable terrain data, the contextual analysis of tactical scenes, and a structural target analysis and recognition system. G.R.

**A86-15283**
**AIRID - AN APPLICATION OF THE KAS/PROSPECTOR EXPERT SYSTEM BUILDER TO AIRPLANE IDENTIFICATION**
J. P. ALDRIDGE (Los Alamos National Laboratory, NM) IN: Applications of artificial intelligence; Proceedings of the Meeting, Arlington, VA, May 3, 4, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 73-79.

The Knowledge Acquisition System/Prospector expert system building tool has been used to construct an expert system to identify aircraft on the basis of observables such as wing shape, engine number/location, fuselage shape, and tail assembly shape. Additional detailed features are allowed to influence the identification as 'other favorable features'. Constraints on the observations imposed by bad weather and distant observations have been included as contexts to the models. Models for Soviet and U.S. fighter aircraft have been included. Inclusion of other types of aircraft such as bombers, transports, and reconnaissance craft is straightforward. Two models permit exploration of the interaction of semantic and taxonomic networks with the models. A full set of text data for fluid communication with the user has been included. The use of demons as triggered output responses to enhance utility to the user has been explored. This paper presents discussion of the ease of building the expert system using this powerful tool and problems encountered in the construction process. Author

**STATISTICAL SAMPLING OF AIRCRAFT OPERATIONS AT NON-TOWERED AIRPORTS**
M. FORD and R. SHIRACK Apr. 1985 49 p
(AD-A157095; FAA-APO-85-7) Avail: NTIS HC A03/MF A01 CSCL 12A

The purpose of this handbook is to provide a statistically sound method of estimating aircraft operations at non-towered airports from sampling counts. The handbook is written for planners, engineers, airport operators responsible for aircraft planning, and persons that collect data for FAA Airport Master Records (Form 5010.1). Many of these users will be familiar with general aviation airports, but not necessarily with statistical methods. Accurate information on aircraft activity at non-towered airports is a major need of airport owners and operators as well as planners and administrators charged with the planning and development of the airport system. Unlike towered airports, where air traffic controllers keep constant tallies of activity, most non-towered airports have no accurate record of usage. Obtaining accurate aircraft activity counts will provide a variety of benefits. Investment decisions can be made with more confidence if benefit-cost analysis is based on accurate information about use of the facility. Design criteria, which may have a significant impact on development and operating costs; can be more efficiently applied. Even when decisions are based on forecasts rather than present circumstances, accurate base data is necessary to make accurate forecasts of activity. GRA

**DEVELOPMENT OF A FLIGHT SOFTWARE TESTING METHODOLOGY Final Report**
E. J. MCCLUSKEY and D. M. ANDREWS Sep. 1985 29 p refs
(Contract NAG2-246)
(NASA-CR-176391; NAS 1.26:176391) Avail: NTIS HC A03/MF A01 CSCL 09B

The research to develop a testing methodology for flight software is described. An experiment was conducted in using assertions to dynamically test digital flight control software. The experiment showed that 87% of typical errors introduced into the program would be detected by assertions. Detailed analysis of the test data showed that the number of assertions needed to detect those errors could be reduced to a minimal set. The analysis also revealed that the most effective assertions tested program parameters that provided greater indirect (collateral) testing of other parameters. In addition, a prototype watchdog task system was built to evaluate the effectiveness of executing assertions in parallel by using the multitasking features of Ada. Author

**THE MISSION ORIENTED TERMINAL AREA SIMULATION FACILITY**
J. T. KAYLOR, H. I. SIMMONS, P. B. NAFTEL (Research Triangle Inst.), J. A. HOUCK, and R. D. GROVE Oct. 1985 63 p refs
(NASA-TM-87621; NAS 1.15:87621) Avail: NTIS HC A04/MF A01 CSCL 09B

The Mission Oriented Terminal Area Simulation (MOTAS) was developed to provide an ATC environment in which flight management and flight operations research studies can be conducted with a high degree of realism. This facility provides a flexible and comprehensive simulation of the airborne, ground-based and communication aspects of the airport terminal area environment. Major elements of the simulation are: an airport terminal area environment model, two air traffic controller stations, several aircraft models and simulator cockpits, four pseudo pilot stations, and a realistic air-ground communications network. MOTAS has been used for one study with the DC-9 simulator and a series of data link studies are planned in the near future. Author

**A METHOD TO STABILIZE LINEAR SYSTEMS USING EIGENVALUE GRADIENT INFORMATION**
C. D. WIESEMAN Nov. 1985 40 p refs
(NASA-TP-2479; L-15964; NAS 1.60:2479) Avail: NTIS HC A03/MF A01 CSCL 09B

Formal optimization methods and eigenvalue gradient information are used to develop a stabilizing control law for a closed loop linear system that is initially unstable. The method was originally formulated by using direct, constrained optimization methods with the constraints being the real parts of the eigenvalues. However, because of problems in trying to achieve stabilizing control laws, the problem was reformulated to be solved differently. The method described uses the Davidon-Fletcher-Powell minimization technique to solve an indirect, constrained minimization problem in which the performance index is the Kreisselmeier-Steinhauser function of the real parts of all the eigenvalues. The method is applied successfully to solve two different problems: the determination of a fourth-order control law stabilizes a single-input single-output active flutter suppression system and the determination of a second-order control law for a multi-input multi-output lateral-directional flight control system. Various sets of design variables and initial starting points were chosen to show the robustness of the method. Author

**COMPUTER GRAPHICS APPLICATIONS TO CREW DISPLAYS Final Report**
J. WYZKOSKI *In* NASA. Johnson (Lyndon B.) Space Center The 1983 NASA/ASEE Summer Faculty Fellowship Research Program Research Reports 10 p Sep. 1983 refs
Avail: NTIS HC A18/MF A01 CSCL 09B

Astronauts are provided much data and information via the monochrome CRT displays on the orbiter. For this project two areas were investigated for the possible introduction of computer graphics to enhance and extend the utility of these displays. One involved reviewing the current orbiter displays and identifying those which could be improved via computer graphics. As an example, the tabular data on electrical power distribution and control was enhanced by the addition of color and bar charts. The other dealt with the development of an aid to berthing a payload with the Remote Manipulator System (RMS). This aid consists of a graphics display of the top, front and side views of the payload and cargo bay and point of resolution (POR) position and attitude data for the current location of the payload. The initial implementation was on an IBM PC clone. The demonstration software installed in the Johnson Space Center Manipulator Development Facility (MD) was reviewed. Due to current hardware limitations, the MDF verision is slow, i.e., about a 40+ seond update rate and, hence, not real-time. Despite this fact, the evaluation of this additional visual cue as an RMS operator aid indicates that this display, with modifications for speed, etc., can assist the crew. Further development is appropriate. Author

**RADIATIVE GASDYNAMIC PROCESSES IN IMPLODING DISCHARGES IN A PLASMODYNAMIC MAGNETOPLASMA COMPRESSOR**

A. S. KAMRUKOV, N. P. KOZLOV, IU. S. PROTASOV, and S. N. CHUVASHEV (Moskovskoe Vysshee Tekhnicheskoe Uchilishche, Moscow, USSR) (Zhurnal Tekhnicheskoi Fiziki, vol. 55, Mar. 1985, p. 533-543) Soviet Physics - Technical Physics (ISSN 0038-5662), vol. 30, March 1985, p. 315-321. Translation. refs

Radiative gasdynamic processes in collapsing radiating plasmodynamic discharges in magnetoplasma compressors are simulated numerically and the results are compargd with available experimental data. The nonequilibrium ionic composition, the electron-ion temperature stratification, and the vaporization and influx of vaporized material from the transparent channel walls into the plasma in the implosion zone are all found to be important. The interaction between radiation and vaporization appreciably alters the time dependence of the light output relative to the pumping pulse and enhances the light-emitting efficiency of the discharge. **ACOUSTIC CHARACTERISTICS OF MODELS OF EJECTOR SUPPRESSORS OF JET NOISE [AKUSTICHESKIE KHARAKTERISTIKI MODELEI EZHEKTORNYKH GLUSHITELEI SHUMA STRUI]**

IU. G. ZHULEV, O. V. LEBEDEVA, A. G. MUNIN, and IU. F. POTAPOV TsAGI, Uchenye Zapiski (ISSN 0321-3429), vol. 15, no. 5, 1984, p. 46-53. In Russian. refs

The paper presents the results of an experimental study of the acoustic characteristics of a jet-noise suppressor in the form of a corrugated nozzle and an ejector with sound-absorbing walls. It is shown that a particular combination of outlet-nozzle shapes and ejector dimensions makes it possible to reduce the jet noise to 13 dB in the range of spectrum components where the noise is maximal. This result holds both for stationary conditions and for flight conditions at speeds up to 270 km/hour. B.J.

**FIBER OPTICS IN ADVERSE ENVIRONMENTS II; PROCEEDINGS OF THE MEETING, SAN DIEGO, CA, AUGUST 22-24, 1984**

R. A. GREENWELL, ED. (Science and Engineering Associates, Inc., Seattle, WA) Meeting sponsored by SPIE - The International Society for Optical Engineering. Bellingham, WA, SPIE - The International Society for Optical Engineering (SPIE Proceedings. Volume 506), 1984, 244 p. For individual items see A86-15341 to A86-15343.
(SPIE-506)

Measurements and characterization of fiber optics in radiation environments are considered, taking into account material dispersion measurements on fiber optic cables used at the Nevada Test Site, gamma-ray to Cerenkov light conversion efficiency for pure-silica-core optical fibers, the measurement of transient radiation effects in optical fibers, optical characterization of radiation-resistant fibers, and a high-bandwidth multichannel fiber optic system for measuring gamma rays. Other topics discussed are related to radiation test monitoring systems using fiber optics, fiber optic systems in adverse environments, fiber optics in the electromagnetic environment, environmental effects on fiber optic components, radiation effects in optical fibers, and radiation effects on fiber optic devices. Attention is given to the radiation response of optical fibers in a nuclear reactor, a fiber optic digital uplink for ocean-floor experimentation, fiber optic aircraft systems electromagnetic pulse (EMP) survivability, and transient attenuation in optical fibers. **SOUND GENERATION BY FLOW OVER RELATIVELY DEEP CYLINDRICAL CAVITIES**

S. P. PARTHASARATHY, Y. I. CHO, and L. H. BACK (California Institute of Technology, Jet Propulsion Laboratory, Pasadena) Acoustical Society of America, Journal (ISSN 0001-4966), vol. 78, Nov. 1985, p. 1785-1795. Army-sponsored research. refs

To develop a system for acoustic coding of moving objects containing drilled cylindrical cavities, the production of high-intensity tones by deep cylindrical cavities in a flat surface at low (0.12-0.24) Mach numbers was investigated. The sound intensity and frequency have been determined as functions of flow velocity, diameter, and depth of the cavities. It is shown that whistles can be designed for a given frequency (in the range of 5-17 kHz) and flow, and the sound pressure levels can be calculated by the equations given. Using these equations a whistle producing 106 dB at a 30.5-cm distance from a cylindrical cavity of 0.508 cm in diameter and 1.32 cm in depth with an airflow of 57.7 m/s past the cavity was designed. **PRELIMINARY MEASUREMENT OF THE NOISE FROM THE 2/9 SCALE MODEL OF THE LARGE-SCALE ADVANCED PROPFAN (LAP) PROPELLER, SR-7A**

J. H. DITTMAR Sep. 1985 22 p refs
(NASA-TM-87116; E-2718; NAS 1.15:87116) Avail: NTIS HC A02/MF A01 CSCL 02A

Noise data on the Large-scale Advanced Propfan (LAP) propeller model SR-7A were taken into the NASA Lewis 8- by 6-Foot Wind Tunnel. The maximum blade passing tone decreases from the peak level when going to higher helical tip Mach numbers. This noise reduction points to the use of higher propeller speeds as a possible method to reduce airplane cabin noise while maintaining high flight speed and efficiency. Comparison of the SR-7A blade passing noise with the noise of the similarly designed SR-3 propeller shows good agreement as expected. The SR-7A propeller is slightly noisier than the SR-3 model in the plane of rotation at the cruise condition. Projections of the tunnel model data are made to the full-scale LAP propeller mounted on the test bed aircraft and compared with design predictions. The prediction method is conservative in the sense that it overpredicts the projected model data. Author

**SOME DESIGN PHILOSOPHY FOR REDUCING THE COMMUNITY NOISE OF ADVANCED COUNTER-ROTATION PROPELLERS**

J. H. DITTMAR Aug. 1985 29 p refs
(NASA-TM-87099; E-2692; NAS 1.15:87099) Avail: NTIS HC A03/MF A01 CSCL 20A

Advanced counter-rotation propellers have been indicated as possibly generating an unacceptable amount of noise for the people living near an airport. This report has explored ways to reduce this noise level, which is treated as being caused by the interaction of the upstream propeller wakes and vortices with the downstream propeller. The noise reduction techniques fall into two categories: (1) reducing the strength of the wakes and vortices, and (2) reducing the response of the downstream blades to them. The noise from the wake interaction was indicated as being reduced by increased propeller spacing and decreased blade drag coefficient. The vortex-interaction noise could be eliminated by having the vortex pass over the tips of the downstream blade, and it could be reduced by increased spacing or decreased initial circulation. The downstream blade response could be lessened by increasing the reduced frequency parameter omega or by phasing of the response from different sections to have a mutual cancellation effect. Uneven blade to blade spacing for the downstream blading was indicated as having a possible effect on the annoyance of counter-rotation propeller noise. Although there are undoubtedly additional methods of noise reduction not covered in this report, the inclusion of the design methods discussed would potentially result in a counter-rotation propeller that is acceptably quiet. On June 1, 1980, the University of Akron and the NASA Lewis Research Center (LERC) established a Graduate Cooperative Fellowship Program in the specialized areas of Engine Structural Analysis and Dynamics, Computational Mechanics, Mechanics of Composite Materials, and Structural Optimization, in order to promote and develop requisite technologies in these areas of engine technology. The objectives of this program are consistent with those of the NASA Engine Structure Program in which graduate students of the University of Akron participate by conducting research at Lewis. This report is the second on this grant and summarizes the second and third year research effort, which includes the participation of five graduate students where each student selects one of the above areas as his special field of interest. Each student is required to spend 30 percent of his educational training time at the NASA Lewis Research Center and the balance at the University of Akron. His course work is judiciously selected and tailored to prepare him for research work in his field of interest. A research topic is selected for each student while in residence at the NASA Lewis Research Center, which is also approved by the faculty of the University of Akron as his thesis topic for a Master's and/or a Ph.D. degree. The Aeronautics and Space Engineering Board (ASEB) of the National Research Council conducted a Workshop on Aeronautical Technology: a Projection to the Year 2000 (Aerotech 2000 Workshop). The panels were asked to project advances in aeronautical technologies that could be available by the year 2000. As the workshop was drawing to a close, it became evident that a more comprehensive investigation of advanced air vehicle concepts than was possible in the limited time available at the workshop would be valuable. Thus, a special panel on vehicle applications was organized. In the course of two meetings, the panel identified and described representative types of aircraft judged possible with the workshop's technology projections. These representative aircraft types include: military aircraft; transport aircraft; rotorcraft; extremely high altitude aircraft; and transatmospheric aircraft. Improvements in performance, efficiency, and operational characteristics possible through the application of the workshop's year 2000 technology projections were discussed. The subgroups also identified the technologies considered essential and enhancing or supporting to achieve the projected aircraft improvements. B.W.

The 1983 NASA/ASEE Summary Faculty Fellowship Research Program was conducted by Texas A&M University and the Lyndon B. Johnson Space Center (JSC). The 10-week program was operated under the auspices of the American Society for Engineering Education (ASEE). The basic objectives of the programs, which began in 1965 at JSC and in 1964 nationally, are (1) to further the professional knowledge of qualified engineering and science faculty members, (2) to stimulate an exchange of ideas between participants and NASA, (3) to enrich and refresh the research and teaching activities of participants' institutions, and (4) to contribute to the research objectives of the NASA Centers. The faculty fellows spent 10 weeks at JSC engaged in a research project commensurate with their interests and background. They worked in collaboration with a NASA/JSC colleague. This document is a compilation of final reports on their research during the summer of 1983.

The United States Government has a long history of promoting the advancement of technology to strengthen the economy and national defense. An example is NASA, which was formed in 1958 to establish and maintain U.S. space technology leadership. This leadership has resulted in technological benefits to many fields and the establishment of new commercial industries, such as satellite communications. Currently, NASA's leading technology development at Ames Research Center includes the Tilt Rotor XV-15, which provides the versatility of a helicopter with the speed of a turboprop aircraft; the Numerical Aerodynamic Simulator, which is pushing the state of the art in advanced computational mathematics and computer simulation; and the Advanced Automation and Robotics programs, which will improve all areas of space development as well as life on Earth. Private industry is involved in maintaining technological leadership through NASA's Commercial Use of Space Program, which provides for synergistic relationships among government, industry, and academia. The plan for a space station by 1992 has framed much of NASA's future goals and has provided new areas of opportunity for both domestic space technology and leadership improvement of life on Earth. # SUBJECT INDEX

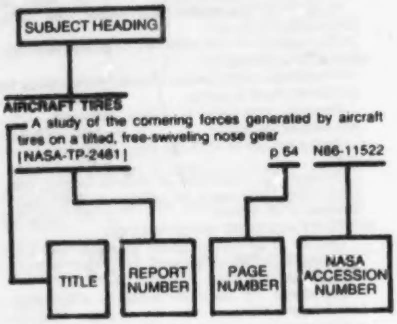
**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 198)* MARCH 1986

## Typical Subject Index Listing



The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

Flow of a diatomic rarefied gas around a cone p 78 A86-13360

Characteristics of the lifting properties of aircraft with sweptforward wings at supersonic velocities p 96 A86-13371

A study of the normal of a delta-wing aircraft at large angles of attack during unsteady motion p 79 A86-13379

Statistical formulation of the objectives of the aerodynamic experiment p 80 A86-13381

Certain characteristics of parachute-wing aerodynamics p 80 A86-13389

Using the shock-expansion method for calculating the aerodynamic characteristics of flight vehicles p 81 A86-13398

The use of reverse flow to calculate transonic flow past bodies p 81 A86-13412

Asymptotic solution of the fluid-flow problem in the core of a vortex sheet p 81 A86-13413

Analytical method for considering the elasticity of the blades in the aerodynamic calculation of a helicopter propeller p 96 A86-13421

Calculation of supersonic flow past a three-dimensional configuration using integral relationships p 81 A86-13423

Certain problems of fluid flow near the core of a spiral discontinuity p 120 A86-13424

Formation of asymmetric separated flow past slender bodies of revolution at large angles of attack p 82 A86-13429

Certain properties of two-dimensional flows in the case of flow past bodies with jets p 82 A86-13431

Supersonic gas flow past a V-shaped wing p 82 A86-13440

A method for numerical analysis of the aerodynamic characteristics of an aeroplane wing in the subcritical range of the flying velocity p 83 A86-13933

Quasi-solutions of an inverse boundary value problem of hydroaerodynamics p 120 A86-13983

Experimental study of gas flow around blunt objects p 85 A86-15980

Aerodynamic characteristics of a propulsive wing-canard concept at STOL speeds [NASA-CR-177982] p 86 N86-12205

Assessment of aerodynamic and dynamic models in a comprehensive analysis [NASA-TM-86835] p 76 N86-13266

**AERODYNAMIC COEFFICIENTS**

Statistical formulation of the objectives of the aerodynamic experiment p 80 A86-13381

Free-falling autorotating plate - A coupled fluid and flight mechanics problem p 110 A86-14533

**AERODYNAMIC CONFIGURATIONS**

Sound generation by flow over relatively deep cylindrical cavities p 129 A86-16058

Aerodynamic characteristics of a propulsive wing-canard concept at STOL speeds [NASA-CR-177982] p 86 N86-12205

Double-branched vortex generator [NASA-TM-88201] p 89 N86-13298

**AERODYNAMIC DRAG**

Certain characteristics of parachute-wing aerodynamics p 80 A86-13389

Boundary-layer development on the afterbody of an engine nacelle p 82 A86-13532

The drag of a thermally insulated plate in a stream of a compressible gas under mixed flow conditions p 120 A86-13671

Thrust and drag: Its prediction and verification --- Book p 98 A86-14161

Ice shapes and the resulting drag increase for a NACA 0012 airfoil [AIAA PAPER 84-0109] p 90 A86-14427

Length adjustable strut link with low aerodynamic drag [AD-D011851] p 107 N86-12232

Preliminary report on in-flight measurement of rotor hub drag and lift using the RSRA [NASA-TM-86764] p 100 N86-13319

Fluid forces on two circular cylinders in crossflow [DE85-014294] p 124 N86-13704

Crushing strength of aluminum oxide agglomerates [AD-A158051] p 124 N86-13756

**AERODYNAMIC FORCES**

A study of the normal of a delta-wing aircraft at large angles of attack during unsteady motion p 79 A86-13379

A combined method for the analysis of the aerodynamic forces acting on an oscillating flight vehicle in supersonic flow p 79 A86-13380

Comment on 'Aerodynamic estimation techniques for aerostats and airships' p 85 A86-14541

**AERODYNAMIC HEAT TRANSFER**

A study of heat transfer on wedges with a swept leading edge and a sharply bent generatrix p 81 A86-13399

**AERODYNAMIC HEATING**

Panel design for optimum strength and stability with allowance for the nonuniformity of heating p 119 A86-13357

Subsonic thermal wind tunnel with an Eiffel chamber p 112 A86-13443

**AERODYNAMIC INTERFERENCE**

Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections [NASA-CR-177992] p 86 N86-12204

**AERODYNAMIC LOADS**
Separated flow unsteady aerodynamic theory p 85 A86-14529
**AERODYNAMIC NOISE**
Sound generation by flow over relatively deep cylindrical cavities p 129 A86-16058
**AERODYNAMIC STABILITY**
Hypersonic flow past non-slender wedges, cones and ogives in oscillation p 76 A86-13047
Estimation of the fluctuation amplitude of the angle of attack of a flight vehicle with nonlinear damping characteristics in the presence of atmospheric turbulence p 114 A86-13386
Aeromechanical stability analysis of a hybrid heavy lift multirotor vehicle in hover p 110 A86-14530
Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight p 98 A86-16123
Interactive aircraft flight control and aeroelastic stabilization [NASA-CR-176323] p 110 N86-12233
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces [AD-A158803] p 111 N86-13334
**AERODYNAMIC STALLING**
Unsteady aerodynamics of airfoils oscillating in and out of dynamic stall [AIAA PAPER 85-4078] p 84 A86-14453
Air Force Academy Aeronautics Digest [AD-A157215] p 76 N86-12200
Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation [AD-A157108] p 107 N86-12229
Post stall maneuvers and thrust vectoring performance analysis [AD-A158100] p 110 N86-12235

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 2 [NASA-CR-174923-VOL-2] p 108 N86-13329

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 3 [NASA-CR-174923-VOL-3] p 108 N86-13330

Polymer, metal and ceramic matrix composites for advanced aircraft engine applications [NASA-TM-87132] p 117 N86-13407

**AIRCRAFT EQUIPMENT**

Navy should join the Air Force and Army program to develop an advanced integrated avionics system [PB85-222503] p 104 N86-12224

Compartmented, filament wound, one-piece aircraft fuel tanks [AD-D011793] p 107 N86-12225

Physical distribution system for aircraft external fuel tanks-survey [AD-A158275] p 101 N86-13324

**AIRCRAFT FUELS**

Physical distribution system for aircraft external fuel tanks-survey [AD-A158275] p 101 N86-13324

**AIRCRAFT HAZARDS**

The numerical computation of aircraft response to arbitrary vertical gust distributions p 110 A86-14534

**AIRCRAFT INSTRUMENTS**

Air Force flight test instrumentation system p 102 A86-13202

T-33 (Silver Star MK 3) pitot-static system calibration [AD-A157854] p 104 N86-12221

Navy should join the Air Force and Army program to develop an advanced integrated avionics system [PB85-222503] p 104 N86-12224

**AIRCRAFT LANDING**

Aircraft field repair p 115 A86-13172

Estimation of the deviation limits of the aircraft path parameters during automatic landing p 108 A86-13365

An investigation into the vertical axis control power requirements for landing VTOL type aircraft onboard nonaviation ships in various sea states [NASA-CR-176355] p 88 N86-13294

A durable airfield marking system [AD-A157953] p 113 N86-13339

**AIRCRAFT MAINTENANCE**

Composite repairs — Book p 115 A86-13103

Constant temperature heaters for the repair of composite structures p 115 A86-13174

A self-repairing aircraft? — new control methods for fighter stabilization p 110 A86-14243

**AIRCRAFT MANEUVERS**

Using roll-angle measurements to track aircraft maneuvers p 92 A86-12677

Method for calculating the equilibrium spin of an aircraft p 109 A86-13435

Calculation of equilibrium turn p 109 A86-13436

Aero/propulsion technology for STOL and maneuver [AIAA PAPER 85-4013] p 97 A86-14436

**AIRCRAFT NOISE**

Transmission acoustic vibration testing [AD-A159022] p 101 N86-13326

**AIRCRAFT PARTS**

A low temperature curing, quick repair, fuel resistant aircraft sealant p 115 A86-13082

A method for numerical analysis of the aerodynamic characteristics of an aeroplane wing in the subcritical range of the flying velocity p 83 A86-13933

**AIRCRAFT PERFORMANCE**

Air Force flight test instrumentation system p 102 A86-13202

A programmable data acquisition system with integrated test and calibration facilities — in-flight aircraft testing p 102 A86-13215

Aero/propulsion technology for STOL and maneuver [AIAA PAPER 85-4013] p 97 A86-14436

Optical technique to study the impact of heavy rain on aircraft performance [NASA-CR-177989] p 123 N86-12580

**AIRCRAFT PILOTS**

An application of adaptive learning to malfunction recovery [AD-A158129] p 110 N86-12236

**AIRCRAFT POWER SUPPLIES**

Reserve generator for over-ocean twins p 106 A86-14244

Two-hundred to 300 KVA conditioned power system - development, phase 1 [AD-A158820] p 125 N86-13832

**AIRCRAFT PRODUCTION**

Flexible assembly subsystems — automated airframe assembly p 126 A86-13125

The use of automated riveting systems in aircraft construction p 95 A86-13127

Technological support for aircraft production — Russian book p 75 A86-13446

Manufacturers prepare for Europe's new fighters p 75 A86-13549

Forging in the aerospace industry p 121 A86-14424

Productivity improvements through the use of CAD/CAM p 121 A86-14538

Certification granted to Franco-Italian ATR 42 p 92 N86-13617

ATR 42 production work in French, Italian plants detailed p 76 N86-13618

**AIRCRAFT RELIABILITY**

Estimation of the probability of a flight parameter exceeding a specified value under conditions of atmospheric turbulence p 108 A86-13355

Ground-simulation investigation of VTOL airworthiness criteria for terminal area operations p 90 A86-14237

Limited Airworthiness and Flight Characteristics (A and FC) test of the quick fix configuration [AD-A157716] p 101 N86-13323

**AIRCRAFT SAFETY**

Hardware integrity — description of new 32-bit microprocessor architecture for increased air safety p 126 A86-13049

The development of dynamic performance standards for general aviation aircraft seats [SAE PAPER 850853] p 97 A86-14449

FAA (Federal Aviation Administration) could improve overall aviation safety and reduce costs associated with airport instrument landing systems [PB85-195444] p 91 N86-12215

Advanced emergency openings for commercial aircraft [NASA-TM-87580] p 91 N86-13305

**AIRCRAFT STABILITY**

A property of the elastic vibrations of nearly symmetric systems p 119 A86-13367

Dynamics of non-autonomous spatial motion of an aeroplane with deformable control systems p 109 A86-13931

**AIRCRAFT STRUCTURES**

Age creep forming in an autoclave p 118 A86-13135

Prediction and measurement of damping of vibrations of structures by adhesives p 118 A86-13171

Constant temperature heaters for the repair of composite structures p 115 A86-13174

Correlation of GPS receiver channel track continuity with aircraft structural masking p 92 A86-13217

Strain measurement of the USB-flap structures of NAL STOL aircraft p 95 A86-13315

Consideration of the multiplicity of critical spots in a structure in estimating the durability and the service life p 119 A86-13367

A model for the life variance of a structural element under irregular loading p 119 A86-13368

Using isoperimetric inequalities for the two-sided estimation of the torsional stiffness of a prismatic bar p 119 A86-13410

Computation of aeronautical structures — Romanian book p 120 A86-14157

Flutter clearance tests on a Transavia PL-12/T-400 Skyfarmer [AD-A157212] p 110 N86-12234

ATR 42 production work in French, Italian plants detailed p 76 N86-13618

**AIRCRAFT SURVIVABILITY**

The fundamentals of aircraft combat survivability analysis and design — Book p 97 A86-14498

Impact of flying qualities on mission effectiveness for helicopter air combat p 110 A86-14531

**AIRCRAFT TIRES**

Equations of rolling for a wheel with an elastic tire p 96 A86-13369

**AIRCRAFT WAKES**

Effect of cantilevers on the lift characteristics of a thin swept wing and vortex-wake stability p 81 A86-13422

**AIRFOIL PROFILES**

Critical values of the Mach number of a radial airfoil cascade — for determining turboprop engine efficiency p 105 A86-13406

Linear theory of an equivalent profile in the problem concerning the influence of porous flow boundaries p 81 A86-13411

A solution of inverse problem for multi-element aerofoils through application of panel method p 83 A86-13546

A new fast solver procedure applied to the BGK computer program for transonic flow past an aerofoil p 83 A86-14360

Viscous flow results for the vortex-airfoil interaction problem [AIAA PAPER 85-4053] p 83 A86-14451

**AIRFOILS**

High-temperature thermocouple and heat flux gauge using a unique thin film-hardware hot junction [ASME PAPER 85-GT-18] p 117 A86-13059

Local heat-transfer measurements on a large scale-model turbine blade airfoil using a composite of a heater element and liquid crystals [ASME PAPER 85-GT-59] p 117 A86-13061

Ice shapes and the resulting drag increase for a NACA 0012 airfoil [AIAA PAPER 84-0109] p 90 A86-14427

Air Force Academy Aeronautics Digest [AD-A157215] p 76 N86-12200

GRUMFOIL: A computer code for the viscous transonic flow over airfoils [NASA-CR-3806] p 86 N86-12202

The status of two-dimensional testing at high transonic speeds in the University of Southampton transonic self-streamlining wind tunnel
[NASA-CR-3919] p 86 N86-12203
Aerodynamic characteristics of a propulsive wing-canard concept at STOL speeds
[NASA-CR-177962] p 86 N86-12205
An improved viscid/inviscid interaction procedure for transonic flow over airfoils
[NASA-CR-3805] p 87 N86-12208
An evaluation of four methods of numerical analysis for two-dimensional airfoil flows. Revision
[AD-A157248] p 87 N86-12209
Improved temperature detection system for use on film cooled turbine airfoils
[AD-D011762] p 107 N86-12228
A direct-inverse method for transonic and separated flows about airfoils
[NASA-CR-176403] p 88 N86-13300
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[AD-A157750] p 89 N86-13301

**AIRFRAMES**
Flexible assembly subsystems — automated airframe assembly p 126 A86-13125
Nondestructive test methods for composite structures p 118 A86-13147
Studies of rotor-airframe interactions in forward flight
[AIAA PAPER 85-5015] p 97 A86-14458
A survey of aeronautical structural research in Australia
[AD-A157211] p 76 N86-12199
Digital servocontroller system. Volume 4. Results and conclusions
[AD-A158068] p 111 N86-13335

**AIRLINE OPERATIONS**
Minimization of aircraft flight time for a given distance with return to the original point p 109 A86-13417
Selection of an optimal cost index for airline hub operation p 130 A86-14239

**AIRPORT PLANNING**
Statistical sampling of aircraft operations at non-towered airports
[AD-A157095] p 128 N86-13051

**AIRPORT TOWERS**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314

**AIRPORTS**
Aircraft field repair p 115 A86-13172
Liability of air traffic control agencies and airport operators in civil law jurisdictions p 130 A86-14372
FAA (Federal Aviation Administration) could improve overall aviation safety and reduce costs associated with airport instrument landing systems
[PB85-195444] p 91 N86-12215
Report of accomplishments under the airport improvement program
[AD-A156834] p 113 N86-12241
CBR (California Bearing Ratio) design of flexible airfield pavements with case study
[AD-A158101] p 113 N86-12242
A durable airfield marking system
[AD-A157953] p 113 N86-13339

**AIRSHIPS**
Stability and control of VTOL capable airships in hovering flight p 109 A86-14236
Comment on 'Aerodynamic estimation techniques for aerostats and airships' p 85 A86-14541

**AIRSPEED**
A method for numerical analysis of the aerodynamic characteristics of an aeroplane wing in the subcritical range of the flying velocity p 83 A86-13933
T-33 (Silver Star MK 3) pitot-static system calibration
[AD-A157654] p 104 N86-12221
Interactive aircraft flight control and aeroelastic stabilization
[NASA-CR-176323] p 110 N86-12233

**ALGORITHMS**
Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections
[NASA-CR-177992] p 86 N86-12204
Computational aspects of zonal algorithms for solving the compressible Navier-Stokes equations in three dimensions
[NASA-TM-86774] p 88 N86-13296
The evaluation of failure detection and isolation algorithms for restructurable control
[NASA-CR-177983] p 93 N86-13310
Algorithms for the reduction of wind-tunnel data derived from strain gauge force balances
[ARL/AERO-R-164] p 113 N86-13337

**ALL-WEATHER AIR NAVIGATION**
LANTIRN - Turning night into day p 103 A86-15589

**ALTIMETERS**
Effects of digital altimetry on pilot workload
[NASA-TM-86424] p 126 N86-13892

**ALTITUDE CONTROL**
Pilot-oriented performance measurement
[AD-A158649] p 126 N86-13890

**ALTITUDE SIMULATION**
Wind tunnel turning vanes of modern design
[NASA-TM-87146] p 113 N86-12239
Method to detect ethylene glycol in gaseous mixtures
[AD-A158109] p 116 N86-12272

**ALTITUDE TESTS**
T-33 (Silver Star MK 3) pitot-static system calibration
[AD-A157654] p 104 N86-12221

**ALUMINUM**
Abrasion behavior of aluminum and composite skin coupons, stiffened skins and stiffened panels representative of transport airplane structures
[NASA-TP-2520] p 100 N86-13318

**ALUMINUM ALLOYS**
Fracture toughness characterization of light alloys for aeronautical use p 114 A86-12761
Age creep forming in an autoclave p 118 A86-13135
Metals anad plastics - State of the art and perspectives
[MBB-Z-49-85-OE] p 116 A86-14474

**ALUMINUM COATINGS**
Protecting gas turbine components - The relative durability of a conventional and a platinum-modified aluminide coating p 114 A86-13005
A durable airfield marking system
[AD-A157953] p 113 N86-13339

**ALUMINUM OXIDES**
Crushing strength of aluminum oxide agglomerates
[AD-A158051] p 124 N86-13756

**AMPLITUDES**
Waves due to a steadily moving source on a floating ice plate — used as aircraft runway p 124 A86-13535
Effect of surface waviness on a supercritical laminar-flow-control airfoil
[NASA-TM-85705] p 86 N86-12206

**ANALYSIS (MATHEMATICS)**
Discovery of the Kalman filter as a practical tool for aerospace and industry
[NASA-TM-86847] p 94 N86-13311

**ANGLE OF ATTACK**
A study of the normal of a delta-wing aircraft at large angles of attack during unsteady motion p 79 A86-13379
Estimation of the fluctuation amplitude of the angle of attack of a flight vehicle with nonlinear damping characteristics in the presence of atmospheric turbulence p 114 A86-13386
Performance of an alpha-vane and pitot tube in simulated heavy rain environment
[NASA-CR-176353] p 103 N86-12220
Post stall maneuvers and thrust vectoring performance analysis
[AD-A158100] p 110 N86-12235

**ANGLES (GEOMETRY)**
Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation
[AD-A157108] p 107 N86-12229

**ANTENNA RADIATION PATTERNS**
ELT antenna gain distributions under simulated crash conditions p 92 A86-12986

**ANTIRADAR COATINGS**
Radio-absorbing materials
[AD-A157498] p 122 N86-12495

**ANTISUBMARINE WARFARE AIRCRAFT**
Radio frequency chamber improves LAMPS Mk III testing p 112 A86-15526

**APPENDAGES**
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows
[AD-A157078] p 123 N86-12552

**APPROACH INDICATORS**
An analytical comparison of three visual approach slope indicators: VASIS, T-VASIS and PAPI
[ARL/SYS-R-33] p 93 N86-13309

**APPROXIMATION**
Construction of equivalent profiles and approximate calculation of transonic flow past the root section of a swept wing p 80 A86-13396
Determination of the shape of a profile from a specified chord diagram of Mach numbers in transonic flow p 80 A86-13397
Using the shock-expansion method for calculating the aerodynamic characteristics of flight vehicles p 81 A86-13398

**ARCHITECTURE**
CBR (California Bearing Ratio) design of flexible airfield pavements with case study
[AD-A158101] p 113 N86-12242
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314

**ARCHITECTURE (COMPUTERS)**
Hardware integrity — description of new 32-bit microprocessor architecture for increased air safety p 128 A86-13049
Advanced avionics computer architecture. Volume 1. Executive summary
[AD-A158119] p 104 N86-12222
Advanced avionics computer architecture. Volume 2. Instruction set architecture specification
[AD-A158120] p 104 N86-12223

**ARM (ANATOMY)**
Passive arm retention curtain
[AD-D011876] p 91 N86-13307

**ARMED FORCES (UNITED STATES)**
The C-17: We need it yesterday
[AD-A157147] p 99 N86-12217
The helicopter to fixed wing conversion program: A critical review
[AD-A158820] p 125 N86-12966
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314

**ARROW WINGS**
Selecting the principal parameters of a wedge-profiled wing p 78 A86-13258

**ARTIFICIAL INTELLIGENCE**
Applications of artificial intelligence; Proceedings of the Meeting, Arlington, VA, May 3, 4, 1984
[SPIE-485] p 127 A86-15278
The Autonomous Helicopter System p 75 A86-15285
An analysis of the application of AI to the development of intelligent aids for flight crew tasks
[NASA-CR-3944] p 90 N86-12212

**ASPECT RATIO**
An analysis of separated flow of an ideal fluid past a finite-aspect-ratio mechanized wing p 80 A86-13395
Wing aspect ratio optimization related to payload and to fuel consumption of transport propeller airplanes
[SAWE PAPER 1616] p 96 A86-14675

**ASSEMBLING**
Flexible assembly subsystems — automated airframe assembly p 126 A86-13125
ATR 42 production work in French, Italian plants detailed p 76 N86-13618

**ASSESSMENTS**
Assessment of aerodynamic and dynamic models in a comprehensive analysis
[NASA-TM-86835] p 76 N86-13286

**ASTRODYNAMICS**
China report: Science and technology
[JPRS-CST-85-035] p 122 N86-12369

**ASTRONOMY**
USSR report: Space
[JPRS-USP-85-005] p 131 N86-14111

**ASYMPTOTIC METHODS**
Asymptotic solution of the fluid-flow problem in the core of a vortex sheet p 81 A86-13413

**ATMOSPHERIC CIRCULATION**
Evaluation of meteorological airborne Doppler radar. I Dual-Doppler analyses of air motions. II - Triple-Doppler analyses of air motions p 103 A86-14223

**ATMOSPHERIC DENSITY**
A tomographic technique for aerodynamics at transonic speeds
[NASA-TM-86786] p 89 N86-13297

**ATMOSPHERIC STRATIFICATION**
Wind shear induced by solitary waves in the lower atmosphere
[IAF PAPER 85-410] p 125 A86-15888

**ATMOSPHERIC TURBULENCE**
Estimation of the probability of a flight parameter exceeding a specified value under conditions of atmospheric turbulence p 108 A86-13365
Estimation of the fluctuation amplitude of the angle of attack of a flight vehicle with nonlinear damping characteristics in the presence of atmospheric turbulence p 114 A86-13386

**ATOMIC RECOMBINATION**
Measurement of the heterogeneous recombination probability of oxygen atoms in the course of supersonic dissociated gas flow interaction with solid body surfaces p 85 A86-14743

**ATTACK AIRCRAFT**
Modeling realistic environmental stresses on external stores p 95 A86-13275

**ATTITUDE CONTROL**
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334

**AUTOCLAVES**
Age creep forming in an autoclave p 118 A86-13135

**AUTOMATIC CONTROL**
Flexible assembly subsystems — automated airframe assembly p 126 A86-13125
The use of automated riveting systems in aircraft construction p 95 A86-13127

**AUTOMATIC LANDING CONTROL**
Estimation of the deviation limits of the aircraft path parameters during automatic landing p 108 A86-13365

**AUTOMATIC PILOTS**
Automation and integration on AFTI/F-16 [AIAA PAPER 85-3069] p 103 A86-14433

**AUTOMATIC TEST EQUIPMENT**
Boeing Military Airplane Company's robotic ultrasonic inspection system p 118 A86-13180
Grumman's automated test systems p 111 A86-13214
Portable computerized tester improves flight-line maintenance p 121 A86-15528

**AUTOMATION**
F/A 18 composite wing automated drilling system p 117 A86-13111
The use of automated riveting systems in aircraft construction p 95 A86-13127
Grumman's automated test systems p 111 A86-13214
A self-repairing aircraft? — new control methods for fighter stabilization p 110 A86-14243
Alerted monitors: Human operators aided by automated detectors [PB85-222750] p 128 N86-13906

**AUTOMOBILES**
West Europe report: Science and technology [JPRS-WST-85-031] p 123 N86-13616

**AUTONOMOUS NAVIGATION**
The Autonomous Helicopter System p 75 A86-15285

**AUTOROTATION**
Free-falling autorotating plate - A coupled fluid and flight mechanics problem p 110 A86-14533

**AVIONICS**
A microprocessor-based digital voice network p 118 A86-13221
Military avionics p 102 A86-13269
The right combination unlocks aerospace EMC p 112 A86-13648
Fiber optic aircraft systems electromagnetic pulse (EMP) survivability p 100 A86-15342
Radio frequency chamber improves LAMPS Mk III testing p 112 A86-15626
Advanced avionics computer architecture. Volume 1. Executive summary [AD-A158119] p 104 N86-12222
Advanced avionics computer architecture. Volume 2. Instruction set architecture specification [AD-A158120] p 104 N86-12223
Navy should join the Air Force and Army program to develop an advanced integrated avionics system [PB85-222503] p 104 N86-12224
Introduction to operational ASDAR system p 125 N86-12915

**AXIAL COMPRESSION LOADS**
Weight optimization of stiffened cylinders under axial compression p 120 A86-14348

**AXIAL FLOW PUMPS**
Fluid machines: Expanding the limits, past and future [NASA-TM-87161] p 107 N86-12227

**AXIAL FLOW TURBINES**
Design of the flow path of aircraft gas-turbine engines — Russian book p 105 A86-13447

**AXISYMMETRIC BODIES**
A joint analysis of the boundary layer and inviscid flow around the axisymmetric rear section of a fuselage p 79 A86-13373

**AXISYMMETRIC FLOW**
A numerical study of axisymmetric flow past a disk p 79 A86-13377
Theory of self-similar regimes of supersonic flow in an axisymmetric channel with a sudden expansion p 82 A86-13427
A numerical method for calculating internal subsonic swirling flows of an ideal gas p 85 A86-14679

## B

**B-1 AIRCRAFT**
Structural bonding with polysulfide adhesive on B-1B aircraft p 94 A86-13106

**BATHYMETERS**
Data analysis of airborne electromagnetic bathymetry [AD-A157132] p 125 N86-12744

**BENDING VIBRATION**
Certain criteria and formulas for the analysis of flexural-torsional flutter p 109 A86-13394

**BIOTECHNOLOGY**
West Europe report: Science and technology [JPRS-WST-85-031] p 123 N86-13616

**BIPLANES**
China report: Science and technology [JPRS-CST-85-029] p 122 N86-12446
Wingtip sails tested on Y-5 aircraft p 99 N86-12450

**BIRD-AIRCRAFT COLLISIONS**
Response determination of propeller to bird strike using high speed photography p 90 A86-15306

**BLADE SLAP NOISE**
Review of recent research on interior noise of propeller aircraft p 97 A86-14527

**BLADE TIPS**
Velocity measurements in the near field of a rotor blade in hover [AIAA PAPER 85-5013] p 84 A86-14457
Pressure fluctuations on rotor blades generated by blade-vortex interaction p 86 A86-16122

**BLUNT BODIES**
A marching explicit-implicit procedure for calculating supersonic flow past bodies p 78 A86-13296
The effect of the bluntness and the half-angle of a cone on the turbulent transition of a boundary layer at free-stream Mach 6 p 80 A86-13391
Experimental study of gas flow around blunt objects p 85 A86-15960

**BODY-WING CONFIGURATIONS**
Juncture flow control using leading-edge fillets [AIAA PAPER 85-4097] p 84 A86-14454

**BOEING AIRCRAFT**
Boeing Military Airplane Company's robotic ultrasonic inspection system p 118 A86-13160
7J7 - Boeing sets the pace p 97 A86-14361
Productivity improvements through the use of CAD/CAM p 121 A86-14538

**BOEING 737 AIRCRAFT**
A preliminary evaluation of the generalized likelihood ratio for detecting and identifying control element failures in a transport aircraft [NASA-TM-87620] p 111 N86-13332

**BOEING 767 AIRCRAFT**
Reserve generator for over-ocean twins p 106 A86-14244

**BOUNDARY LAYER CONTROL**
The laminar airliner - Prospects and problems — review of boundary layer control research p 98 A86-14822
Ground vibration test of the laminar flow control JStar airplane [NASA-TM-86398] p 100 N86-13321

**BOUNDARY LAYER EQUATIONS**
The efficient simulation of separated three-dimensional viscous flows using the boundary-layer equations [AIAA PAPER 85-4064] p 84 A86-14452

**BOUNDARY LAYER FLOW**
A joint analysis of the boundary layer and inviscid flow around the axisymmetric rear section of a fuselage p 79 A86-13373
Multistage compressor stator/rotor interaction p 85 A86-14556
An evaluation of four methods of numerical analysis for two-dimensional airfoil flows. Revision [AD-A157248] p 87 N86-12209
BLR studies on conic model with LDA in FL-1 wind tunnel p 87 N86-12434
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift [AD-A157750] p 89 N86-13301

**BOUNDARY LAYER SEPARATION**
The efficient simulation of separated three-dimensional viscous flows using the boundary-layer equations [AIAA PAPER 85-4064] p 84 A86-14452
An evaluation of four methods of numerical analysis for two-dimensional airfoil flows. Revision [AD-A157248] p 87 N86-12209
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows [AD-A157078] p 123 N86-12552
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift [AD-A157750] p 89 N86-13301

**BOUNDARY LAYER STABILITY**
A numerical analysis of the characteristics of a Tollmien-Schlichting wave packet in a boundary layer on a flat plate p 79 A86-13374

**BOUNDARY LAYER TRANSITION**
The effect of the bluntness and the half-angle of a cone on the turbulent transition of a boundary layer at free-stream Mach 6 p 80 A86-13391
The drag of a thermally insulated plate in a stream of a compressible gas under mixed flow conditions p 120 A86-13671
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows [AD-A157078] p 123 N86-12552
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition [AD-A157943] p 89 N86-13302

**BOUNDARY VALUE PROBLEMS**
Equations of rolling for a wheel with an elastic tire p 96 A86-13369
Quasi-solutions of an inverse boundary value problem of hydroaerodynamics p 120 A86-13983

**BUCKLING**
Computation of aeronautical structures — Romanian book p 120 A86-14157

**BURNERS**
Ribbon-burner simulation of T-700 turbine shroud for ceramic-lined seals research p 106 A86-15225

## C

**C-140 AIRCRAFT**
Ground vibration test of the laminar flow control JStar airplane [NASA-TM-86398] p 100 N86-13321

**C-5 AIRCRAFT**
Electrically conductive structural adhesive p 115 A86-13170

**CALIBRATING**
T-33 (Silver Star MK 3) pitot-static system calibration [AD-A157854] p 104 N86-12221

**CANARD CONFIGURATIONS**
Aerodynamic characteristics of a propulsive wing-canard concept at STOL speeds [NASA-CR-177982] p 86 N86-12205

**CANOPIES**
Development and evaluation of a microburst test apparatus for use as a minimum destructive test for parachute material [AD-A158110] p 123 N86-12620

**CANTILEVER MEMBERS**
Effect of cantilevers on the lift characteristics of a thin swept wing and vortex-wake stability p 81 A86-13422
Flutter and divergence aeroelastic characteristics for composite forward swept cantilevered wing p 97 A86-14536

**CASCADE FLOW**
Secondary flows and losses downstream of a turbine cascade [ASME PAPER 85-GT-64] p 77 A86-13062
Performance evaluation of linear turbine cascades using three-dimensional viscous flow calculations [ASME PAPER 85-G-65] p 77 A86-13063
Simulation of the effects of shock wave passing on a turbine rotor blade [ASME PAPER 85-GT-112] p 77 A86-13067
Critical values of the Mach number of a radial airfoil cascade — for determining turboprop engine efficiency p 105 A86-13408
Calculation of flow around rotating circular cascades with allowance for circumferential flow nonuniformity induced by a perturbation at the inlet p 82 A86-13426

**CASCADE WIND TUNNELS**
Wind tunnel turning vanes of modern design [NASA-TM-87146] p 113 N86-12239

**CATHODE RAY TUBES**
Computer graphics applications to crew displays p 128 N86-14104

**CAVITIES**
Sound generation by flow over relatively deep cylindrical cavities p 129 A86-16058

**CENTRIFUGAL PUMPS**
Fluid machines: Expanding the limits, past and future [NASA-TM-87161] p 107 N86-12227

**CERAMIC COATINGS**
A durable airfield marking system [AD-A157953] p 113 N86-13339

**CERAMIC MATRIX COMPOSITES**
Polymer, metal and ceramic matrix composites for advanced aircraft engine applications [NASA-TM-87132] p 117 N86-13407

**CERAMICS**
Ribbon-burner simulation of T-700 turbine shroud for ceramic-lined seals research p 106 A86-15225
Experimental study of ceramic-coated tip seals for turbojet engines p 121 A86-15227
West Europe report: Science and technology [JPRS-WST-85-031] p 123 N86-13616

**CHANNEL FLOW**
Linear theory of an equivalent profile in the problem concerning the influence of porous flow boundaries p 81 A86-13411
Theory of self-similar regimes of supersonic flow in an axisymmetric channel with a sudden expansion p 82 A86-13427

Wall-interference assessment in three-dimensional slotted-wall wind tunnels
[NASA-CR-176320] p 113 N86-12240
Experimental study of the combustion of gas-air mixtures in a channel and the diffusion combustion in a slipstream at high velocities
[AD-A157495] p 116 N86-12271

**CHANNELS (DATA TRANSMISSION)**
An over the horizon command/data link system
p 92 A86-13224

**CHEMICAL COMPOSITION**
Composition and photochemical reactivity of turbine engine exhaust
[AD-A157643] p 107 N86-12230

**CHEMICAL REACTIONS**
China report: Science and technology
[JPRS-CST-85-035] p 122 N86-12399

**CHINA**
China report: Science and technology
[JPRS-CST-85-029] p 122 N86-12446
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302

**CHIPS (ELECTRONICS)**
China report: Science and technology
[JPRS-CST-85-029] p 122 N86-12446

**CHORDS (GEOMETRY)**
Determination of the shape of a profile from a specified chord diagram of Mach numbers in transonic flow
p 80 A86-13397

**CIRCUIT PROTECTION**
Conformal coating for surface mount assembly
p 115 A86-13118

**CIRCUITS**
Transient test of suspension electronics for gyroscope
[AD-D011853] p 123 N86-12585
Two-hundred to 300 KVA conditioned power system - development, phase 1
[AD-A158820] p 125 N86-13832

**CIVIL AVIATION**
Air traffic prediction and optimal control of air transportation system — Russian book
p 90 A86-13452
Liability of air traffic control agencies and airport operators in civil law jurisdictions p 130 A86-14372
West Europe report: Science and technology
[JPRS-WST-85-031] p 123 N86-13616
Certification granted to Franco-Italian ATR 42
p 92 N86-13617
ATR 42 production work in French, Italian plants detailed p 76 N86-13618

**CLAYS**
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302

**CLINICAL MEDICINE**
Criteria for a state-of-the-art vision test system
[AD-A157099] p 126 N86-12973

**CLOUD GLACIATION**
Heat transfer and pressure drop performance of a finned-tube heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel
[NASA-TM-87151] p 123 N86-13677

**CLOUDS**
Aircrew dose and engine dust ingestion from nuclear cloud penetration
[AD-A159246] p 101 N86-13327

**COCKPITS**
Military avionics p 102 A86-13269
An analysis of the application of AI to the development of intelligent aids for flight crew tasks
[NASA-CR-3944] p 90 N86-12212

**COLD FLOW TESTS**
Solid fuel ramjet simulator results - Experiment and analysis in cold flow — solid fuel ramjet
p 106 A86-14562

**COLLISION AVOIDANCE**
Simulation of the enhanced traffic alert and collision avoidance system (TCAS 2)
[NASA-CR-176328] p 93 N86-12216

**COLOR**
Military avionics p 102 A86-13269

**COLOR VISION**
Criteria for a state-of-the-art vision test system
[AD-A157099] p 126 N86-12973

**COMBAT**
The fundamentals of aircraft combat survivability analysis and design — Book p 97 A86-14498
Impact of flying qualities on mission effectiveness for helicopter air combat p 110 A86-14531

**COMBINED STRESS**
Certain criteria and formulas for the analysis of flexural-torsional flutter p 109 A86-13394
Analytical method for considering the elasticity of the blades in the aerodynamic calculation of a helicopter propeller p 96 A86-13421

**COMBUSTION**
Experimental study of the combustion of gas-air mixtures in a channel and the diffusion combustion in a slipstream at high velocities
[AD-A157495] p 116 N86-12271

**COMBUSTION CHAMBERS**
Composition and photochemical reactivity of turbine engine exhaust
[AD-A157643] p 107 N86-12230

**COMBUSTION CHEMISTRY**
Dynamic features of combustion p 114 A86-12925

**COMBUSTION PHYSICS**
Dynamic features of combustion p 114 A86-12925
Calculation of unsteady flow in a two-stage gas turbine engine p 105 A86-13444

**COMBUSTION PRODUCTS**
Crushing strength of aluminum oxide agglomerates
[AD-A158051] p 124 N86-13756

**COMMERCIAL AIRCRAFT**
The influence of advanced propulsion on short- to medium-range transport design p 95 A86-13264
7J7 - Boeing sets the pace p 97 A86-14361
Douglas plans continuing upgrades to maintain MD-80 competitiveness p 98 A86-15999
Certification granted to Franco-Italian ATR 42
p 92 N86-13617
ATR 42 production work in French, Italian plants detailed p 76 N86-13618

**COMMUNICATION EQUIPMENT**
The RAJPO GPS range equipment family — navigation modules for various military applications
p 92 A86-13216

**COMMUNITIES**
Some design philosophy for reducing the community noise of advanced counter-rotation propellers
[NASA-TM-87099] p 129 N86-14007

**COMPLEX NUMBERS**
Rotor dynamics equations in complex form
p 122 A86-16040

**COMPOSITE MATERIALS**
Aircraft interior panel test criteria derived from full-scale fire tests
[FAA/CT-85/23] p 91 N86-12214
Effect of measured material properties on the finite element analysis of an OH-58 composite tail boom
[NASA-TM-86430] p 116 N86-12259
Polymer, metal and ceramic matrix composites for advanced aircraft engine applications
[NASA-TM-87132] p 117 N86-13407

**COMPOSITE STRUCTURES**
Adhesive system for high temperature destructive testing of composite structures p 115 A86-13101
F/A 18 composite wing automated drilling system
p 117 A86-13111
Nondestructive test methods for composite structures
p 118 A86-13147
Constant temperature heaters for the repair of composite structures p 115 A86-13174
Flutter and divergence aeroelastic characteristics for composite forward swept cantilevered wing
p 97 A86-14536
The performance of composite structures
p 121 A86-14680

**COMPRESSED GAS**
Compact gas ejector of a high degree of compression with spiral arrangement of the nozzles
p 82 A86-13433

**COMPRESSIBLE BOUNDARY LAYER**
A numerical analysis of the characteristics of a Tollmien-Schlichting wave packet in a boundary layer on a flat plate p 79 A86-13374

**COMPRESSIBLE FLOW**
The linear theory of a profile in a compressible gas with additional jet flow p 78 A86-13351
The drag of a thermally insulated plate in a stream of a compressible gas under mixed flow conditions
p 120 A86-13671
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

**COMPRESSION TESTS**
Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation
[AD-A157108] p 107 N86-12229

**COMPRESSORS**
Radiative gasdynamic processes in imploding discharges in a plasmodynamic magnetoplasma compressor p 129 A86-13031
Experimental evaluation of heavy fan-high-pressure compressor interaction in a three-shaft engine. I - Experimental setup and results
[ASME PAPER 85-GT-173] p 104 A86-13053
Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation
[AD-A157108] p 107 N86-12229

**COMPUTATIONAL FLUID DYNAMICS**
Aerodynamics - The role of the computer
p 76 A86-13050
Numerical analysis of fully three-dimensional periodic flows through a turbine stage
[ASME PAPER 85-GT-57] p 76 A86-13060
Calculation of flows in two- and three-dimensional nozzles by an approximate factorization method
p 77 A86-13294
A marching explicit-implicit procedure for calculating supersonic flow past bodies p 78 A86-13296
Some solutions to the Karman equation describing flow past the salient points of a profile p 79 A86-13363
Calculation of supersonic inviscid flow past a plane air intake element with an isolated head wave
p 79 A86-13364
A joint analysis of the boundary layer and inviscid flow around the axisymmetric rear section of a fuselage
p 79 A86-13373
A numerical analysis of the characteristics of a Tollmien-Schlichting wave packet in a boundary layer on a flat plate p 79 A86-13374
Profiling of supersonic ducts with specified nonisentropic parameters at the exit p 79 A86-13375
A numerical study of axisymmetric flow past a disk
p 79 A86-13377
An analysis of separated flow of an ideal fluid past a finite-aspect-ratio mechanized wing p 80 A86-13395
Using the shock-expansion method for calculating the aerodynamic characteristics of flight vehicles
p 81 A86-13398
Critical values of the Mach number of a radial airfoil cascade — for determining turboprop engine efficiency
p 105 A86-13408
The use of reverse flow to calculate transonic flow past bodies p 81 A86-13412
Asymptotic solution of the fluid-flow problem in the core of a vortex sheet p 81 A86-13413
Calculation of flow around rotating circular cascades with allowance for circumferential flow nonuniformity induced by a perturbation at the inlet p 82 A86-13426
A solution of inverse problem for multi-element aerofoils through application of panel method p 83 A86-13546
Unsteady potential flow for oscillating airfoils
p 83 A86-14359
Evaluation of a method for analyzing the aperture region of two-dimensional external compression inlets
[AIAA PAPER 85-3072] p 83 A86-14432
Computation of rotor blade flows using the Euler equations
[AIAA PAPER 85-5010] p 84 A86-14455
Solution of transonic flow past rotor blades using the conservative full potential equation
[AIAA PAPER 85-5012] p 84 A86-14456
Doublet strip method for oscillating swept tapered wings in incompressible flow p 85 A86-14537
Evaluation of low Reynolds number turbulence models for attached and separated flows p 121 A86-14539
Calculation of unsteady fan rotor response caused by downstream flow distortions p 85 A86-14558
Calculation of steady flow about propellers using a surface panel method p 85 A86-14559
A numerical method for calculating internal subsonic swirling flows of an ideal gas p 85 A86-14679
Some recent advances in computational aerodynamics for helicopter applications
[NASA-TM-86777] p 87 N86-12207
PLTTER user's guide
[NASA-CR-177385] p 88 N86-13291
On applications of chimera grid schemes to store separation
[NASA-TM-88193] p 88 N86-13292
Computational aspects of zonal algorithms for solving the compressible Navier-Stokes equations in three dimensions
[NASA-TM-86774] p 88 N86-13296

**COMPUTATIONAL GRIDS**
A method for arranging nodes along the lines of a computational grid during the numerical solution of problems in mathematical physics p 127 A86-13409
On applications of chimera grid schemes to store separation
[NASA-TM-88193] p 88 N86-13292

**COMPUTER AIDED DESIGN**
Prediction and measurement of damping of vibrations of structures by adhesives p 118 A86-13171
Expert systems and their use in augmenting design optimization
[AIAA PAPER 85-3095] p 127 A86-14434
Productivity improvements through the use of CAD/CAM p 121 A86-14538

Hub effects in propeller design and analysis
[AD-A158853] p 108 N86-13331

**COMPUTER AIDED MANUFACTURING**
Forging in the aerospace industry p 121 A86-14424
Productivity improvements through the use of CAD/CAM p 121 A86-14538

**COMPUTER AIDED TOMOGRAPHY**
A tomographic technique for aerodynamics at transonic speeds
[NASA-TM-86786] p 89 N86-13297

**COMPUTER ASSISTED INSTRUCTION**
Computer aided instruction in engineering
[AD-A158828] p 130 N86-13220

**COMPUTER GRAPHICS**
Computer graphics applications to crew displays
p 128 N86-14104

**COMPUTER PROGRAMS**
The in-flight simulation program at the NAE Flight Research Laboratory p 96 A86-14356
A new fast solver procedure applied to the BGK computer program for transonic flow past an aerofoil
p 83 A86-14360
DEAN - A program for Dynamic Engine ANalysis
[AIAA PAPER 85-1354] p 106 A86-14430
GRUMFOIL: A computer code for the viscous transonic flow over airfoils
[NASA-CR-3806] p 86 N86-12202
An evaluation of four methods of numerical analysis for two-dimensional airfoil flows. Revision
[AD-A157248] p 87 N86-12209
User's guide to STIPPAN: A panel method program for slotted tunnel interference prediction
[NASA-CR-176003] p 113 N86-12237
A direct-inverse method for transonic and separated flows about airfoils
[NASA-CR-176403] p 89 N86-13300
Development of a flight software testing methodology
[NASA-CR-176391] p 128 N86-13922

**COMPUTER SYSTEMS PROGRAMS**
Infrared flight simulation using computer generated imagery p 103 A86-15378

**COMPUTER TECHNIQUES**
Aerodynamics - The role of the computer
p 76 A86-13050

**COMPUTER VISION**
Applications of artificial intelligence; Proceedings of the Meeting, Arlington, VA, May 3, 4, 1984
[SPIE-485] p 127 A86-15278

**COMPUTERIZED SIMULATION**
The in-flight simulation program at the NAE Flight Research Laboratory p 96 A86-14356
DEAN - A program for Dynamic Engine ANalysis
[AIAA PAPER 85-1354] p 106 A86-14430
The efficient simulation of separated three-dimensional viscous flows using the boundary-layer equations
[AIAA PAPER 85-4064] p 84 A86-14452
Engine simulator techniques for scaled test cell studies
[AIAA PAPER 85-1282] p 112 A86-14480
Simulation of the enhanced traffic alert and collision avoidance system (TCAS 2)
[NASA-CR-176328] p 93 N86-12216
Aircraft crashing. Analysis and identification methods. Presentation of a solution method
[IMFL-4116] p 91 N86-13308

**COMPUTERS**
China report: Science and technology
[JPRS-CST-85-035] p 122 N86-12399
West Europe report: Science and technology
[JPRS-WST-85-031] p 123 N86-13616

**CONES**
The effect of the bluntness and the half-angle of a cone on the turbulent transition of a boundary layer at free-stream Mach 6 p 80 A86-13391

**CONFERENCES**
National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings
p 115 A86-13076
Applications of artificial intelligence; Proceedings of the Meeting, Arlington, VA, May 3, 4, 1984
[SPIE-485] p 127 A86-15278
Fiber optics in adverse environments II; Proceedings of the Meeting, San Diego, CA, August 22-24, 1984
[SPIE-506] p 129 A86-15340

**CONFIGURATION INTERACTION**
Some design philosophy for reducing the community noise of advanced counter-rotation propellers
[NASA-TM-87099] p 129 N86-14007

**CONFORMAL MAPPING**
On applications of chimera grid schemes to store separation
[NASA-TM-88193] p 88 N86-13292

**CONICAL FLOW**
Hypersonic flow past non-slender wedges, cones and ogives in oscillation p 76 A86-13047
Flow of a diatomic rarefied gas around a cone
p 78 A86-13360
Experimental study of gas flow around blunt objects
p 85 A86-15980

**CONICS**
BLR studies on conic model with LDA in FL-1 wind tunnel p 87 N86-12434

**CONNECTORS**
Length adjustable strut link with low aerodynamic drag
[AD-D011851] p 107 N86-12232

**CONSTRUCTION**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314

**CONTRAROTATING PROPELLERS**
Some design philosophy for reducing the community noise of advanced counter-rotation propellers
[NASA-TM-87099] p 129 N86-14007

**CONTROL CONFIGURED VEHICLES**
A self-repairing aircraft? — new control methods for fighter stabilization p 110 A86-14243

**CONTROL EQUIPMENT**
Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections
[NASA-CR-177992] p 86 N86-12204

**CONTROL SIMULATION**
Uncertainty and control - Some activities at DFVLR
p 127 A86-14827

**CONTROL STABILITY**
A method to stabilize linear systems using eigenvalue gradient information
[NASA-TP-2479] p 126 N86-13946

**CONTROL SURFACES**
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334

**CONTROL SYSTEMS DESIGN**
Dynamics of non-autonomous spatial motion of an aeroplane with deformable control systems
p 109 A86-13931
Uncertainty and control - Some activities at DFVLR
p 127 A86-14827
Multi-model approaches to robust control system design p 127 A86-14830
Digital servocontroller system. Volume 4. Results and conclusions
[AD-A159068] p 111 N86-13335

**CONTROL THEORY**
Uncertainty and control - Some activities at DFVLR
p 127 A86-14827
Multi-model approaches to robust control system design p 127 A86-14830

**CONTROLLERS**
Digital servocontroller system. Volume 4. Results and conclusions
[AD-A159068] p 111 N86-13335

**COOLING FINS**
Heat transfer and pressure drop performance of a finned-tube heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel
[NASA-TM-87151] p 123 N86-13677

**CORE FLOW**
Experimental evaluation of heavy fan-high-pressure compressor interaction in a three-shaft engine. I - Experimental setup and results
[ASME PAPER 85-GT-173] p 104 A86-13053

**CORROSION PREVENTION**
Protecting gas turbine components - The relative durability of a conventional and a platinum-modified aluminide coating p 114 A86-13006

**CORROSION RESISTANCE**
A durable airfield marking system
[AD-A157953] p 113 N86-13339

**COST ANALYSIS**
Selection of an optimal cost index for airline hub operation p 130 A86-14239

**COST REDUCTION**
FAA (Federal Aviation Administration) could improve overall aviation safety and reduce costs associated with airport instrument landing systems
[PB85-195444] p 91 N86-12215

**COUNTER ROTATION**
Counterrotating intershaft seals for advanced engines
p 121 A86-14554
Some design philosophy for reducing the community noise of advanced counter-rotation propellers
[NASA-TM-87099] p 129 N86-14007

**CRACK PROPAGATION**
Methods of constructing R-curves and application of these curves for evaluation of materials (Review)
p 117 A86-13011
Cumulative-damage modeling of fatigue crack growth in turbine engine materials p 105 A86-13599

**CRASH LANDING**
Aircraft crashing. Analysis and identification methods. Presentation of a solution method
[IMFL-4116] p 91 N86-13308
Abrasion behavior of aluminum and composite skin coupons, stiffened skins and stiffened panels representative of transport airplane structures
[NASA-TP-2520] p 100 N86-13316

**CRASHES**
ELT antenna gain distributions under simulated crash conditions p 92 A86-12698

**CRASHWORTHINESS**
The development of dynamic performance standards for general aviation aircraft seats
[SAE PAPER 850853] p 97 A86-14449
Advanced technology helicopter landing gear preliminary design investigation
[AD-A158816] p 101 N86-13325

**CREEP PROPERTIES**
Age creep forming in an autoclave
p 118 A86-13135

**CRITERIA**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314

**CRITICAL LOADING**
Consideration of the multiplicity of critical spots in a structure in estimating the durability and the service life
p 119 A86-13367

**CRITICAL VELOCITY**
A study of flutter on the basis of frequency tests at subcritical regimes p 109 A86-13370
Critical values of the Mach number of a radial airfoil cascade — for determining turboprop engine efficiency
p 105 A86-13408

**CROSS FLOW**
Multispark flow visualization of lateral jet injection into a swirling cross flow p 85 A86-14561
Effects of velocity profile and inclination on dual-jet-induced pressures on a flat plate in a crosswind
[NASA-CR-177361] p 87 N86-13287

**CRYOGENIC WIND TUNNELS**
Introduction to cryogenic wind tunnels
[NASA-CR-177986] p 113 N86-12236

**CRYOGENICS**
China report: Science and technology
[JPRS-CST-85-035] p 122 N86-12399

**CUMULATIVE DAMAGE**
Cumulative-damage modeling of fatigue crack growth in turbine engine materials p 105 A86-13599

**CURING**
A low temperature curing, quick repair, fuel resistant aircraft sealant p 115 A86-13082
Constant temperature heaters for the repair of composite structures p 115 A86-13174

**CURRENT DISTRIBUTION**
Two-hundred to 300 KVA conditioned power system - development, phase 1
[AD-A158820] p 125 N86-13632

**CURTAINS**
Passive arm retention curtain
[AD-D011676] p 91 N86-13307

**CURVED PANELS**
Experimental/analytic comparisons considering composite panels with a cutout p 118 A86-13336

**CYLINDRICAL BODIES**
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows
[AD-A157078] p 123 N86-12552
A method for calculating flow fields around moving bodies
[NAL-TR-859T] p 88 N86-13288

**CYLINDRICAL SHELLS**
Weight optimization of stiffened cylinders under axial compression p 120 A86-14348

## D

**DAMAGE**
Damaged runway options explored p 75 A86-15600

**DAMAGE ASSESSMENT**
Composite repairs — Book p 115 A86-13103

**DATA ACQUISITION**
A programmable data acquisition system with integrated test and calibration facilities — in-flight aircraft testing
p 102 A86-13215
An extended phase-lock technique for aided acquisition — in PM demodulators p 93 A86-13227
Introduction to operational ASDAR system
p 125 N86-12915

**DATA BASES**
PLTTER user's guide
[NASA-CR-177365] p 88 N86-13291

**DATA LINKS**
An over the horizon command/data link system
p 92 A86-13224
**DATA PROCESSING**
An integrated soluson for flight test data handling
p 93 A86-13226
Canadian forces PCM telemetry processing and display system p 111 A86-13248
**DATA REDUCTION**
Algorithms for the reduction of wind-tunnel data derived from strain gauge force balances
[ARL/AERO-R-164] p 113 N86-13337
**DATA STORAGE**
PLTTER user's guide
[NASA-CR-177365] p 88 N86-13291
**DATA TRANSMISSION**
An over the horizon command/data link system
p 92 A86-13224
**DECISION MAKING**
Alerted monitors: Human operators aided by automated detectors
[PB85-222750] p 126 N86-13906
**DEFENSE INDUSTRY**
Emerging aerospace technologies
[NASA-TM-86837] p 131 N86-14213
**DEFLECTORS**
The effect of the deflector type on internal heat transfer in blades with transverse coolant flow
p 120 A86-13673
**DELTA WINGS**
Selecting the principal parameters of a wedge-profiled wing p 78 A86-13356
A study of the normal of a delta-wing aircraft at large angles of attack during unsteady motion
p 79 A86-13379
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293
**DENSITY DISTRIBUTION**
A tomographic technique for aerodynamics at transonic speeds
[NASA-TM-86766] p 89 N86-13297
**DESIGN ANALYSIS**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314
Hub effects in propeller design and analysis
[AD-A158853] p 108 N86-13331
Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[NASA-TM-87116] p 129 N86-14006
**DESTRUCTIVE TESTS**
Adhesive system for high temperature destructive testing of composite structures p 115 A86-13101
Development and evaluation of a microburst test apparatus for use as a minimum destructive test for parachute material
[AD-A158110] p 123 N86-12620
**DETECTION**
New passive helicopter detector
[DE85-015160] p 123 N86-12595
**DEVIATION**
Estimation of the deviation limits of the aircraft path parameters during automatic landing
p 108 A86-13365
**DIATOMIC GASES**
Flow of a diatomic rarefied gas around a cone
p 78 A86-13360
**DIESEL ENGINES**
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 1
[NASA-CR-174923-VOL-1] p 108 N86-13328
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 2
[NASA-CR-174923-VOL-2] p 108 N86-13329
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 3
[NASA-CR-174923-VOL-3] p 108 N86-13330
**DIFFUSION**
Experimental study of the combustion of gas-air mixtures in a channel and the diffusion combustion in a slipstream at high velocities
[AD-A157495] p 116 N86-12271
**DIGITAL COMMAND SYSTEMS**
Development of a flight software testing methodology
[NASA-CR-176391] p 128 N86-13922
**DIGITAL NAVIGATION**
Effects of digital altimetry on pilot workload
[NASA-TM-86424] p 126 N86-13892
**DIGITAL SYSTEMS**
Fiber optics for propulsion control systems
[ASME PAPER 84-GT-97] p 105 A86-13054
Military avionics p 102 A86-13269
Application of the state-space method to analyze the stability of digital systems p 127 A86-13418
Digital servocontroller system. Volume 4. Results and conclusions
[AD-A159068] p 111 N86-13335
**DIGITAL TO VOICE TRANSLATORS**
A microprocessor-based digital voice network
p 118 A86-13221
**DIGITALIS**
Effects of digital altimetry on pilot workload
[NASA-TM-86424] p 126 N86-13892
**DISKS (SHAPES)**
A numerical study of axisymmetric flow past a disk
p 79 A86-13377
**DISPLAY DEVICES**
Canadian forces PCM telemetry processing and display system p 111 A86-13248
Military avionics p 102 A86-13269
**DISTRIBUTION**
Physical distribution system for aircraft external fuel tanks-survey
[AD-A158275] p 101 N86-13324
**DOPPLER RADAR**
Evaluation of meteorological airborne Doppler radar. I Dual-Doppler analyses of air motions. II - Triple-Doppler analyses of air motions p 103 A86-14223
**DOSAGE**
Aircrew dose and engine dust ingestion from nuclear cloud penetration
[AD-A158246] p 101 N86-13327
**DOWNWASH**
Some design philosophy for reducing the community noise of advanced counter-rotation propellers
[NASA-TM-87099] p 129 N86-14007
**DRAG MEASUREMENT**
Improved drag element for wind tunnel sting balances
p 112 A86-14932
Air Force Academy Aeronautics Digest
[AD-A157215] p 76 N86-12200
**DRAG REDUCTION**
The laminar airliner - Prospects and problems --- review of boundary layer control research p 98 A86-14822
Length adjustable strut link with low aerodynamic drag
[AD-D011651] p 107 N86-12232
China report: Science and technology
[JPRS-CST-85-029] p 122 N86-12446
Wingtip sails tested on Y-5 aircraft p 99 N86-12450
**DRILLING**
F/A 18 composite wing automated drilling system
p 117 A86-13111
**DROP SIZE**
Optical technique to study the impact of heavy rain on aircraft performance
[NASA-CR-177989] p 123 N86-12580
**DRY FRICTION**
Dynamic response of a laminated plate with friction damping
[ASME PAPER 85-DET-16] p 122 A86-16032
**DUCTED FLOW**
Profiling of supersonic ducts with specified nonisentropic parameters at the exit p 79 A86-13375
Propagation of small perturbations during the interaction of nonviscous jets p 80 A86-13390
A numerical method for calculating internal subsonic swirling flows of an ideal gas p 85 A86-14679
**DURABILITY**
Consideration of the multiplicity of critical spots in a structure in estimating the durability and the service life
p 119 A86-13367
A durable airfield marking system
[AD-A157953] p 113 N86-13339
**DUST**
Aircrew dose and engine dust ingestion from nuclear cloud penetration
[AD-A158246] p 101 N86-13327
**DYNAMIC MODELS**
A linear multivariable dynamical model of a supersonic inlet-engine combination p 85 A86-14560
Assessment of aerodynamic and dynamic models in a comprehensive analysis
[NASA-TM-86835] p 76 N86-13286
**DYNAMIC RESPONSE**
Dynamic response of a laminated plate with friction damping
[ASME PAPER 85-DET-16] p 122 A86-16032
**DYNAMIC STRUCTURAL ANALYSIS**
Allowance for initial conditions in static and dynamic calculations of structures by the finite element method
p 119 A86-13419
Dynamic strength problems in aerospace equipment
p 120 A86-13680
Rotor dynamics equations in complex form
p 122 A86-16040
NASA LeRC/Akron University Graduate Cooperative Fellowship Program and Graduate Student Researchers Program
[NASA-CR-174826] p 130 N86-13219
Ground vibration test of the laminar flow control JStar airplane
[NASA-TM-86398] p 100 N86-13321
**DYNAMIC TESTS**
The development of dynamic performance standards for general aviation aircraft seats
[SAE PAPER 850863] p 97 A86-14449

**E**

**ECONOMIC ANALYSIS**
Radio-absorbing materials
[AD-A157496] p 122 N86-12495
**EDUCATION**
The helicopter to fixed wing conversion program: A critical review
[AD-A156820] p 125 N86-12988
The 1983 NASA/ASEE Summer Faculty Fellowship Research Program research reports
[NASA-CR-171904] p 130 N86-14078
**EFFICIENCY**
Aeronautical technology 2000: A projection of advanced vehicle concepts
[NASA-CR-176322] p 130 N86-13225
**EIGENVALUES**
A method to stabilize linear systems using eigenvalue gradient information
[NASA-TP-2479] p 128 N86-13946
**EJECTION SEATS**
Telemetry from experimental rescue- and recovery systems p 95 A86-13219
Passive arm retention curtain
[AD-D011676] p 91 N86-12307
**EJECTORS**
An experimental study of a vacuum water-air ejector with a multichannel liquid-supply nozzle ensuring jet-pair collision p 119 A86-13382
Acoustic characteristics of models of ejector suppressors of jet noise p 129 A86-13416
Compact gas ejector of a high degree of compression with spiral arrangement of the nozzles
p 82 A86-13433
**ELASTIC DAMPING**
Dynamics of non-autonomous spatial motion of an aeroplane with deformable control systems
p 109 A86-13831
**ELASTIC DEFORMATION**
Equations of rolling for a wheel with an elastic tire
p 96 A86-13366
**ELASTIC PLATES**
Dynamic response of a laminated plate with friction damping
[ASME PAPER 85-DET-16] p 122 A86-16032
**ELASTIC PROPERTIES**
An algorithm for calculating the coupling between matrices of elastic influence coefficients for two systems of computational points p 119 A86-13362
Analytical method for considering the elasticity of the blades in the aerodynamic calculation of a helicopter propeller p 96 A86-13421
**ELASTODYNAMICS**
A study of flutter on the basis of frequency tests at subcritical regimes p 109 A86-13370
**ELECTRIC FIELDS**
Interpretation of F-106B in-flight lightning signatures
[NASA-CR-176387] p 100 N86-13320
**ELECTRIC GENERATORS**
Reserve generator for over-ocean twins
p 106 A86-14244
Two-hundred to 300 KVA conditioned power system - development, phase 1
[AD-A156820] p 125 N86-13832
**ELECTRICAL ENGINEERING**
China report: Science and technology
[JPRS-CST-85-035] p 122 N86-12399
**ELECTRICAL RESISTIVITY**
Electrically conductive structural adhesive
p 115 A86-13170
**ELECTROMAGNETIC COMPATIBILITY**
The right combination unlocks aerospace EMC
p 112 A86-13848
**ELECTROMAGNETIC INTERFERENCE**
The right combination unlocks aerospace EMC
p 112 A86-13848
**ELECTROMAGNETIC MEASUREMENT**
Interpretation of F-106B in-flight lightning signatures
[NASA-CR-176387] p 100 N86-13320
**ELECTROMAGNETIC NOISE**
Fiber optics for propulsion control systems
[ASME PAPER 84-GT-97] p 105 A86-13054
**ELECTROMAGNETIC PULSES**
Fiber optics for propulsion control systems
[ASME PAPER 84-GT-97] p 105 A86-13054
Fiber optic aircraft systems electromagnetic pulse (EMP) survivability p 103 A86-15342

**ELECTROMAGNETIC SHIELDING**
Fiber optic aircraft systems electromagnetic pulse (EMP) survivability p 103 A86-15342
**ELECTROMAGNETISM**
Data analysis of airborne electromagnetic bathymetry
[AD-A157132] p 125 N86-12744
**ELECTRONIC COUNTERMEASURES**
Radio-absorbing materials
[AD-A157486] p 122 N86-12485
**ELECTRONIC EQUIPMENT**
Fiber optic aircraft systems electromagnetic pulse (EMP) survivability p 103 A86-15342
Improved temperature detection system for use on film cooled turbine airfoils
[AD-D011782] p 107 N86-12228
**ELECTRONIC EQUIPMENT TESTS**
The right combination unlocks aerospace EMC
p 112 A86-13848
Radio frequency chamber improves LAMPS Mk III testing p 112 A86-15526
Portable computerized tester improves flight-line maintenance p 121 A86-15528
**ELECTROSTATIC GYROSCOPES**
Transient test of suspension electronics for gyroscope
[AD-D011853] p 123 N86-12586
**ELEVATORS (CONTROL SURFACES)**
A combined method for the analysis of the aerodynamic forces acting on an oscillating flight vehicle in supersonic flow p 79 A86-13360
**EMERGENCIES**
Advanced emergency openings for commercial aircraft
[NASA-TM-87580] p 91 N86-13305
**EMERGENCY LOCATOR TRANSMITTERS**
ELT antenna gain distributions under simulated crash conditions p 92 A86-12698
**ENERGY CONSERVATION**
Polymer, metal and ceramic matrix composites for advanced aircraft engine applications
[NASA-TM-87132] p 117 N86-13407
**ENERGY DISSIPATION**
Secondary flows and losses downstream of a turbine cascade
[ASME PAPER 85-GT-64] p 77 A86-13062
**ENGINE ANALYZERS**
DEAN - A program for Dynamic Engine ANalysis
[AIAA PAPER 85-1354] p 106 A86-14430
**ENGINE CONTROL**
Sensor failure detection for jet engines using analytical redundancy p 106 A86-14226
**ENGINE COOLANTS**
The effect of the deflector type on internal heat transfer in blades with transverse coolant flow
p 120 A86-13673
**ENGINE DESIGN**
Derivative engines versus new engines - What determines the choice?
[ASME PAPER 85-GT-190] p 104 A86-13051
The design, performance and analysis of a high work capacity transonic turbine
[ASME PAPER 85-GT-15] p 105 A86-13058
Structural bonding with polysulfide adhesive on B-1B aircraft p 94 A86-13106
Calculation of unsteady flow in a two-stage gas turbine engine p 105 A86-13444
Design of the flow path of aircraft gas-turbine engines — Russian book p 105 A86-13447
A linear multivariable dynamical model of a supersonic inlet-engine combination p 85 A86-14560
NASA LeRC/Akron University Graduate Cooperative Fellowship Program and Graduate Student Researchers Program
[NASA-CR-174826] p 130 N86-13219
**ENGINE FAILURE**
Sensor failure detection for jet engines using analytical redundancy p 106 A86-14226
**ENGINE INLETS**
Evaluation of a method for analyzing the aperture region of two-dimensional external compression inlets
[AIAA PAPER 85-3072] p 83 A86-14432
Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation
[AD-A157106] p 107 N86-12229
**ENGINE MONITORING INSTRUMENTS**
Sensor failure detection for jet engines using analytical redundancy p 106 A86-14226
**ENGINE TESTS**
New methods of measuring strain and temperature in a turbine engine p 118 A86-13336
Engine simulator techniques for scaled test cell studies
[AIAA PAPER 85-1282] p 112 A86-14480
Subscale-model and full-scale engine mixed-flow exhaust system performance comparison
p 106 A86-14528
**ENVIRONMENT POLLUTION**
Environment protection in connection with air transportation — Russian book p 124 A86-13467
**ENVIRONMENT PROTECTION**
Environment protection in connection with air transportation — Russian book p 124 A86-13467
**ENVIRONMENT SIMULATION**
Ribbon-burner simulation of T-700 turbine shroud for ceramic-lined seals research p 106 A86-15225
**ENVIRONMENTS**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314
**EQUATIONS OF MOTION**
Vibration analysis of rotating turbomachinery blades by an improved finite difference method
p 106 A86-14338
Rotor dynamics equations in complex form
p 122 A86-16040
**EQUATIONS OF STATE**
Application of the state-space method to analyze the stability of digital systems p 127 A86-13418
**EQUIPMENT SPECIFICATIONS**
Radiometric characterization methods for Infrared Countermeasures Systems p 103 A86-15314
**ERROR DETECTION CODES**
Development of a flight software testing methodology
[NASA-CR-176391] p 128 N86-13922
**ESCAPE SYSTEMS**
Parachute recovery systems design manual, chapters 1 through 4 offprint
[AD-A157839] p 87 N86-12210
**ESTIMATING**
Discovery of the Kalman filter as a practical tool for aerospace and industry
[NASA-TM-86847] p 94 N86-13311
**ETHYLENE COMPOUNDS**
Method to detect ethylene glycol in gaseous mixtures
[AD-A158109] p 116 N86-12272
**EULER EQUATIONS OF MOTION**
Computation of rotor blade flows using the Euler equations
[AIAA PAPER 85-5010] p 84 A86-14455
**EVACUATING (TRANSPORTATION)**
Advanced emergency openings for commercial aircraft
[NASA-TM-87580] p 91 N86-13305
**EVALUATION**
Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[NASA-TM-87116] p 129 N86-14006
Computer graphics applications to crew displays
p 128 N86-14104
**EVASIVE ACTIONS**
Missile guidance based on Kalman filter estimation of target maneuver p 102 A86-12683
**EXHAUST EMISSION**
Composition and photochemical reactivity of turbine engine exhaust
[AD-A157643] p 107 N86-12230
**EXHAUST FLOW SIMULATION**
Subscale-model and full-scale engine mixed-flow exhaust system performance comparison
p 106 A86-14528
**EXHAUST GASES**
Composition and photochemical reactivity of turbine engine exhaust
[AD-A157643] p 107 N86-12230
**EXOTHERMIC REACTIONS**
Dynamic features of combustion p 114 A86-12925
**EXPERIENCE**
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302
**EXPERT SYSTEMS**
Expert systems and their use in augmenting design optimization
[AIAA PAPER 85-3095] p 127 A86-14434
Applications of artificial intelligence; Proceedings of the Meeting, Arlington, VA, May 3, 4, 1984
[SPIE-485] p 127 A86-15276
AIRID - An application of the KAS/Prospector expert system builder to airplane identification
p 128 A86-15283
**EXPLOSIVE DEVICES**
Advanced emergency openings for commercial aircraft
[NASA-TM-87580] p 91 N86-13305
**EXTERNAL STORE SEPARATION**
On applications of chimera grid schemes to store separation
[NASA-TM-88193] p 88 N86-13292
**EXTERNAL STORES**
Modeling realistic environmental stresses on external stores p 95 A86-13275

## F

**F-106 AIRCRAFT**
Interpretation of F-106B in-flight lightning signatures
[NASA-CR-176387] p 100 N86-13320
**F-111 AIRCRAFT**
An integrated solution for flight test data handling
p 93 A86-13226
**F-15 AIRCRAFT**
Aero/propulsion technology for STOL and maneuver
[AIAA PAPER 85-4013] p 97 A86-14436
**F-16 AIRCRAFT**
Automation and integration on AFTI/F-16
[AIAA PAPER 85-3089] p 103 A86-14433
**F-4 AIRCRAFT**
F-4 functional modernization
[ASME PAPER 85-GT-69] p 94 A86-13052
**FABRICATION**
ATR 42 production work in French, Italian plants detailed p 76 N86-13618
**FACTORIZATION**
Calculation of flows in two- and three-dimensional nozzles by an approximate factorization method
p 77 A86-13294
**FAILURE ANALYSIS**
A preliminary evaluation of the generalized likelihood ratio for detecting and identifying control element failures in a transport aircraft
[NASA-TM-87620] p 111 N86-13332
**FALLOUT**
Aircrew dose and engine dust ingestion from nuclear cloud penetration
[AD-A159246] p 101 N86-13327
**FAN BLADES**
Experimental evaluation of heavy fan-high-pressure compressor interaction in a three-shaft engine. I - Experimental setup and results
[ASME PAPER 85-GT-173] p 104 A86-13053
**FATIGUE (MATERIALS)**
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 2: Final definition of Helix and Felix
[AD-A156622] p 101 N86-13322
**FATIGUE LIFE**
A model for the life variance of a structural element under irregular loading p 119 A86-13388
Cumulative-damage modeling of fatigue crack growth in turbine engine materials p 105 A86-13599
**FATIGUE TESTING MACHINES**
Experimental/analytic comparisons considering composite panels with a cutout p 118 A86-13338
**FATIGUE TESTS**
Digital servocontroller system. Volume 4. Results and conclusions
[AD-A159068] p 111 N86-13335
**FEASIBILITY ANALYSIS**
F-4 functional modernization
[ASME PAPER 85-GT-69] p 94 A86-13052
'But not with the greatest of ease' - A feasibility study of a human-powered ACV p 121 A86-14355
**FEEDBACK CONTROL**
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334
**FIBER COMPOSITES**
Characterization of the thermal conductivity for fibrous refractory composite insulations p 118 A86-15220
Effect of measured material properties on the finite element analysis of an OH-58 composite tail boom
[NASA-TM-86430] p 116 N86-12259
Development and evaluation of a microburst test apparatus for use as a minimum destructive test for parachute material
[AD-A158110] p 123 N86-12620
**FIBER OPTICS**
Fiber optics for propulsion control systems
[ASME PAPER 84-GT-97] p 105 A86-13054
Requirements for gyroscopes for inertial navigation
p 93 A86-13576
Fiber optics in adverse environments II; Proceedings of the Meeting, San Diego, CA, August 22-24, 1984
[SPIE-506] p 129 A86-15340
EC-135 fiber optic technology review
p 75 A86-15341
Fiber optic aircraft systems electromagnetic pulse (EMP) survivability p 103 A86-15342
**FIBER REINFORCED COMPOSITES**
Composite repairs — Book p 115 A86-13103
**FIELD THEORY (ALGEBRA)**
A method for calculating flow fields around moving bodies
[NAL-TR-859T] p 88 N86-13288
**FIGHTER AIRCRAFT**
F/A 18 composite wing automated drilling system
p 117 A86-13111

Military avionics p 102 A86-13269
Manufacturers prepare for Europe's new fighters p 75 A86-13549
A self-repairing aircraft? — new control methods for fighter stabilization p 110 A86-14243
The 'Super Etendard' is always of interest — transonic attack aircraft p 97 A86-14423
4 x S = S(ATF) — Advanced Tactical Fighter development p 96 A86-15598
LANTIRN - Turning night into day p 103 A86-15599
Damaged runway options explored p 75 A86-15600
Aerodynamic characteristics of a propulsive wing-canard concept at STOL speeds
[NASA-CR-177982] p 86 N86-12205
Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation
[AD-A157108] p 107 N86-12229
Japanese report on China's F-8 fighter p 111 N86-12405
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334

**FILAMENT WINDING**
Compartmented, filament wound, one-piece aircraft fuel tanks
[AD-D011793] p 107 N86-12225
Effect of measured material properties on the finite element analysis of an OH-58 composite tail boom
[NASA-TM-86430] p 116 N86-12259

**FILLETS**
Juncture flow control using leading-edge fillets
[AIAA PAPER 85-4097] p 84 A86-14454

**FILM COOLING**
Improved temperature detection system for use on film cooled turbine airfoils
[AD-D011762] p 107 N86-12228

**FINITE DIFFERENCE THEORY**
A marching explicit-implicit procedure for calculating supersonic flow past bodies p 78 A86-13296
Vibration analysis of rotating turbomachinery blades by an improved finite difference method p 106 A86-14338
On applications of chimera grid schemes to store separation
[NASA-TM-88193] p 88 N86-13292

**FINITE ELEMENT METHOD**
Experimental/analytic comparisons considering composite panels with a cutout p 118 A86-13336
Allowance for initial conditions in static and dynamic calculations of structures by the finite element method p 119 A86-13419
Effect of measured material properties on the finite element analysis of an OH-58 composite tail boom
[NASA-TM-86430] p 116 N86-12259
A method for calculating flow fields around moving bodies
[NAL-TR-859T] p 88 N86-13288

**FINITE VOLUME METHOD**
Numerical analysis of fully three-dimensional periodic flows through a turbine stage
[ASME PAPER 85-GT-57] p 76 A86-13060

**FIRE PREVENTION**
Aircraft interior panel test criteria derived from full-scale fire tests
[FAA/CT-85/23] p 91 N86-12214

**FIRES**
Aircraft interior panel test criteria derived from full-scale fire tests
[FAA/CT-85/23] p 91 N86-12214

**FIXED WINGS**
The helicopter to fixed wing conversion program: A critical review
[AD-A156620] p 125 N86-12968

**FLAME STABILITY**
Solid fuel ramjet simulator results - Experiment and analysis in cold flow — solid fuel ramjet p 106 A86-14562

**FLAMMABILITY**
Aircraft interior panel test criteria derived from full-scale fire tests
[FAA/CT-85/23] p 91 N86-12214

**FLAT PLATES**
A numerical analysis of the characteristics of a Tollmien-Schlichting wave packet in a boundary layer on a flat plate p 79 A86-13374
The drag of a thermally insulated plate in a stream of a compressible gas under mixed flow conditions p 120 A86-13671

**FLIGHT ALTITUDE**
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334

**FLIGHT CHARACTERISTICS**
Estimation of the probability of a flight parameter exceeding a specified value under conditions of atmospheric turbulence p 108 A86-13355
Method for calculating the equilibrium spin of an aircraft p 109 A86-13435
Limited Airworthiness and Flight Characteristics (A and FC) test of the quick fix configuration
[AD-A157716] p 101 N86-13323
Polymer, metal and ceramic matrix composites for advanced aircraft engine applications
[NASA-TM-87132] p 117 N86-13407

**FLIGHT CONDITIONS**
Estimation of the probability of a flight parameter exceeding a specified value under conditions of atmospheric turbulence p 108 A86-13355

**FLIGHT CONTROL**
Automation and integration on AFTI/F-16
[AIAA PAPER 85-3089] p 103 A86-14433
Air Force Academy Aeronautics Digest
[AD-A157215] p 76 N86-12200
Pneumatic actuator device
[AD-D011794] p 99 N86-12217
Interactive aircraft flight control and aeroelastic stabilization
[NASA-CR-176323] p 110 N86-12233
The evaluation of failure detection and isolation algorithms for restructurable control
[NASA-CR-177963] p 93 N86-13310
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334
Development of a flight software testing methodology
[NASA-CR-176391] p 128 N86-13922

**FLIGHT CREWS**
An analysis of the application of AI to the development of intelligent aids for flight crew tasks
[NASA-CR-3944] p 90 N86-12212
Aircrew dose and engine dust ingestion from nuclear cloud penetration
[AD-A159246] p 101 N86-13327

**FLIGHT HAZARDS**
The numerical computation of aircraft response to arbitrary vertical gust distributions p 110 A86-14534
Microbursts - A hazard for aircraft — small, intense thunderstorm outflow p 124 A86-14816

**FLIGHT MANAGEMENT SYSTEMS**
Selection of an optimal cost index for airline hub operation p 130 A86-14239

**FLIGHT MECHANICS**
The in-flight simulation program at the NAE Flight Research Laboratory p 96 A86-14356
Free-falling autorotating plate - A coupled fluid and flight mechanics problem p 110 A86-14533

**FLIGHT OPERATIONS**
Statistical sampling of aircraft operations at non-towered airports
[AD-A157095] p 128 N86-13051

**FLIGHT OPTIMIZATION**
Minimization of aircraft flight time for a given distance with return to the original point p 109 A86-13417

**FLIGHT PATHS**
Estimation of the deviation limits of the aircraft path parameters during automatic landing p 108 A86-13366
Infrared flight simulation using computer generated imagery p 103 A86-15378
Data analysis of airborne electromagnetic bathymetry
[AD-A157132] p 125 N86-12744
An analytical comparison of three visual approach slope indicators: VASIS, T-VASIS and PAPI
[ARL/SYS-R-33] p 93 N86-13309

**FLIGHT SAFETY**
Hardware integrity — description of new 32-bit microprocessor architecture for increased air safety p 126 A86-13049

**FLIGHT SIMULATION**
Modeling realistic environmental stresses on external stores p 95 A86-13275
Simulation world moves up to V/STOL p 112 A86-14246
Infrared flight simulation using computer generated imagery p 103 A86-15378

**FLIGHT SIMULATORS**
G protection by an extreme crouch position
[AD-A157081] p 91 N86-12213

**FLIGHT TESTS**
Air Force flight test instrumentation system p 102 A86-13202
X-29 flight testing p 95 A86-13213
Grumman's automated test systems p 111 A86-13214
A programmable data acquisition system with integrated test and calibration facilities — in-flight aircraft testing p 102 A86-13215
Correlation of GPS receiver channel track continuity with aircraft structural masking p 92 A86-13217
An integrated solution for flight test data handling p 93 A86-13226
Canadian forces PCM telemetry processing and display system p 111 A86-13249
A brief history of the first U.S. JATO flight tests of August 1941
[IAF PAPER 85-453] p 131 A86-15913
Flutter clearance tests on a Transavia PL-12/T-400 Skyfarmer
[AD-A157212] p 110 N86-12234
An analytical comparison of three visual approach slope indicators: VASIS, T-VASIS and PAPI
[ARL/SYS-R-33] p 93 N86-13309
Limited Airworthiness and Flight Characteristics (A and FC) test of the quick fix configuration
[AD-A157716] p 101 N86-13323
Development of a flight software testing methodology
[NASA-CR-176391] p 128 N86-13922

**FLIGHT TIME**
Minimization of aircraft flight time for a given distance with return to the original point p 109 A86-13417
Selection of an optimal cost index for airline hub operation p 130 A86-14239

**FLIGHT VEHICLES**
A study of flutter on the basis of frequency tests at subcritical regimes p 109 A86-13370
Using the shock-expansion method for calculating the aerodynamic characteristics of flight vehicles p 81 A86-13399

**FLOATING**
Waves due to a steadily moving source on a floating ice plate — used as aircraft runway p 124 A86-13535

**FLOW CHARACTERISTICS**
Juncture flow control using leading-edge fillets
[AIAA PAPER 85-4097] p 84 A86-14454
An improved viscid/inviscid interaction procedure for transonic flow over airfoils
[NASA-CR-3605] p 87 N86-12206

**FLOW DEFLECTION**
Some solutions to the Karman equation describing flow past the salient points of a profile p 79 A86-13363
Calculation of supersonic inviscid flow past a plane air intake element with an isolated head wave p 79 A86-13364
A numerical study of axisymmetric flow past a disk p 79 A86-13377
An analysis of separated flow of an ideal fluid past a finite-aspect-ratio mechanized wing p 80 A86-13395
Construction of equivalent profiles and approximate calculation of transonic flow past the root section of a swept wing p 80 A86-13396
The effect of a perforated wall on incompressible flow past a U-shaped vortex p 81 A86-13408
A method for numerical analysis of the aerodynamic characteristics of an aeroplane wing in the subcritical range of the flying velocity p 83 A86-13933
A study of the flow around a wing equipped with a spoiler p 83 A86-14186
A new fast solver procedure applied to the BGK computer program for transonic flow past an aerofoil p 83 A86-14360

**FLOW DIRECTION INDICATORS**
A method for measuring the direction and the Mach number of a three-dimensional supersonic nozzle p 80 A86-13392

**FLOW DISTORTION**
A study of flow near a shock wave intersection line p 78 A86-13353
The effect of the incalculable flow regime of air scoops on flow past a wing p 78 A86-13354
The use of reverse flow to calculate transonic flow past bodies p 81 A86-13412
Calculation of flow around rotating circular cascades with allowance for circumferential flow nonuniformity induced by a perturbation at the inlet p 82 A86-13426
Certain properties of two-dimensional flows in the case of flow past bodies with jets p 82 A86-13431
Calculation of unsteady fan rotor response caused by downstream flow distortions p 85 A86-14558

**FLOW DISTRIBUTION**
Symmetric transonic flow past wings of large aspect ratios p 78 A86-13352
Flow of a diatomic rarefied gas around a cone p 78 A86-13360
Design of the flow path of aircraft gas-turbine engines — Russian book p 105 A86-13447
Multistage compressor stator/rotor interaction p 85 A86-14556
Some recent advances in computational aerodynamics for helicopter applications
[NASA-TM-86777] p 87 N86-12207
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows
[AD-A157078] p 123 N86-12552

A method for calculating flow fields around moving bodies
[NAL-TR-869T] p 88 N86-13288

Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

Computational aspects of zonal algorithms for solving the compressible Navier-Stokes equations in three dimensions
[NASA-TM-86774] p 88 N86-13296

Ground effects on V/STOL and STOL aircraft: A survey
[NASA-TM-86825] p 89 N86-13299

Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[AD-A157750] p 89 N86-13301

Pressure-distribution measurements on a transonic low-aspect ratio wing
[NASA-TM-86683] p 90 N86-13304

Crushing strength of aluminum oxide agglomerates
[AD-A158051] p 124 N86-13756

**FLOW EQUATIONS**

Numerical analysis of fully three-dimensional periodic flows through a turbine stage
[ASME PAPER 85-GT-57] p 76 A86-13060

Some solutions to the Karman equation describing flow past the salient points of a profile p 79 A86-13363

**FLOW GEOMETRY**

Profiling of supersonic ducts with specified nonisentropic parameters at the exit p 79 A86-13375

The effect of a perforated wall on incompressible flow past a U-shaped vortex p 81 A86-13406

Theory of self-similar regimes of supersonic flow in an axisymmetric channel with a sudden expansion
p 82 A86-13427

**FLOW MEASUREMENT**

A method for measuring the direction and the Mach number of a three-dimensional supersonic nozzle
p 80 A86-13392

A study of the flow around a wing equipped with a spoiler p 83 A86-14186

Experimental study of gas flow around blunt objects
p 85 A86-15960

Measurements in the turbulent boundary layer on an 'infinite' swept wing p 86 A86-16102

**FLOW THEORY**

Theory of self-similar regimes of supersonic flow in an axisymmetric channel with a sudden expansion
p 82 A86-13427

Comment on 'Aerodynamic estimation techniques for aerostats and airships' p 85 A86-14541

**FLOW VELOCITY**

BLR studies on conic model with LDA in FL-1 wind tunnel p 87 N86-12434

**FLOW VISUALIZATION**

Certain characteristics of parachute-wing aerodynamics p 80 A86-13389

A study of the flow around a wing equipped with a spoiler p 83 A86-14186

Multispark flow visualization of lateral jet injection into a swirling cross flow p 85 A86-14561

Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302

Pressure-distribution measurements on a transonic low-aspect ratio wing
[NASA-TM-86683] p 90 N86-13304

**FLUID FLOW**

Fluid forces on two circular cylinders in crossflow
[DE85-014294] p 124 N86-13704

**FLUID MECHANICS**

Fluid machines: Expanding the limits, past and future
[NASA-TM-87161] p 107 N86-12227

**FLUTTER**

Flutter and divergence aeroelastic characteristics for composite forward swept cantilevered wing
p 97 A86-14536

**FLUTTER ANALYSIS**

A study of flutter on the basis of frequency tests at subcritical regimes p 109 A86-13370

A combined method for the analysis of the aerodynamic forces acting on an oscillating flight vehicle in supersonic flow p 79 A86-13380

Certain criteria and formulas for the analysis of flexural-torsional flutter p 109 A86-13394

**FM/PM (MODULATION)**

An extended phase-lock technique for aided acquisition --- in PM demodulators p 93 A86-13227

**FORGING**

Forging in the aerospace industry p 121 A86-14424

**FORTRAN**

Simulation of the enhanced traffic alert and collision avoidance system (TCAS 2)
[NASA-CR-176328] p 93 N86-12216

**FRACTURE MECHANICS**

Dynamic strength problems in aerospace equipment
p 120 A86-13620

**FRACTURE STRENGTH**

Fracture toughness characterization of light alloys for aeronautical use p 114 A86-12761

Methods of constructing R-curves and application of these curves for evaluation of materials (Review)
p 117 A86-13011

**FRANCE**

Certification granted to Franco-Italian ATR 42
p 92 N86-13617

ATR 42 production work in French, Italian plants detailed p 76 N86-13116

**FREE FALL**

Free-falling autorotating plate - A coupled fluid and flight mechanics problem p 110 A86-14535

**FUEL CONSUMPTION**

The influence of advanced propulsion on short- to medium-range transport design p 95 A86-13264

Wing aspect ratio optimization related to payload and to fuel consumption of transport propeller airplanes
[SAWE PAPER 1615] p 98 A86-14875

**FUEL CONTROL**

Polymer, metal and ceramic matrix composites for advanced aircraft engine applications
[NASA-TM-87132] p 117 N86-13407

**FUEL INJECTION**

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 1
[NASA-CR-174923-VOL-1] p 108 N86-13328

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 2
[NASA-CR-174923-VOL-2] p 108 N86-13329

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 3
[NASA-CR-174923-VOL-3] p 108 N86-13330

**FUEL TANKS**

A low temperature curing, quick repair, fuel resistant aircraft sealant p 115 A86-13082

Compartmented, filament wound, one-piece aircraft fuel tanks
[AD-D011793] p 107 N86-12225

Physical distribution system for aircraft external fuel tanks-survey
[AD-A158275] p 101 N86-13324

**FUSELAGES**

A joint analysis of the boundary layer and inviscid flow around the axisymmetric rear section of a fuselage
p 79 A86-13373

Simulation of the enhanced traffic alert and collision avoidance system (TCAS 2)
[NASA-CR-176328] p 93 N86-12216

## G

**GAS ANALYSIS**

Method to detect ethylene glycol in gaseous mixtures
[AD-A158109] p 116 N86-12272

**GAS DYNAMICS**

Radiative gasdynamic processes in imploding discharges in a plasmodynamic magnetoplasma compressor p 129 A86-13031

Aerodynamic characteristics of a finite-aspect-ratio wing in hypersonic flow of a radiating gas p 78 A86-13359

Compact gas ejector of a high degree of compression with spiral arrangement of the nozzles
p 82 A86-13433

Supersonic gas flow past a V-shaped wing
p 82 A86-13440

**GAS FLOW**

Measurement of the heterogeneous recombination probability of oxygen atoms in the course of supersonic dissociated gas flow interaction with solid body surfaces
p 85 A86-14743

Experimental study of gas flow around blunt objects
p 85 A86-15960

Improved temperature detection system for use on film cooled turbine airfoils
[AD-D011762] p 107 N86-12228

**GAS INJECTION**

Multispark flow visualization of lateral jet injection into a swirling cross flow p 85 A86-14561

**GAS MIXTURES**

Experimental study of the combustion of gas-air mixtures in a channel and the diffusion combustion in a slipstream at high velocities
[AD-A157495] p 116 N86-12271

**GAS TURBINE ENGINES**

New methods of measuring strain and temperature in a turbine engine p 118 A86-13336

Calculation of unsteady flow in a two-stage gas turbine engine p 105 A86-13444

Design of the flow path of aircraft gas-turbine engines --- Russian book p 105 A86-13447

Sensor failure detection for jet engines using analytical redundancy p 106 A86-14226

Counterrotating intershaft seals for advanced engines
p 121 A86-14554

Precision casting at Rolls-Royce p 121 A86-14973

**GEARS**

Transmission acoustic vibration testing
[AD-A159022] p 101 N86-13326

**GENERAL AVIATION AIRCRAFT**

The development of dynamic performance standards for general aviation aircraft seats
[SAE PAPER 850853] p 97 A86-14449

**GLIDERS**

Design of a minimum-weight gliding wing
p 96 A86-13437

**GLOBAL POSITIONING SYSTEM**

The RAJPO GPS range equipment family --- navigation modules for various military applications
p 92 A86-13216

Correlation of GPS receiver channel track continuity with aircraft structural masking p 92 A86-13217

The use of translators with GPS --- for signal conversion p 93 A86-13230

**GLYCOLS**

Method to detect ethylene glycol in gaseous mixtures
[AD-A158109] p 116 N86-12272

**GOVERNMENT PROCUREMENT**

The C-17: We need it yesterday
[AD-A157147] p 99 N86-12219

**GRANTS**

Report of accomplishments under the airport improvement program
[AD-A156834] p 113 N86-12241

NASA LeRC/Akron University Graduate Cooperative Fellowship Program and Graduate Student Researchers Program
[NASA-CR-174826] p 130 N86-13219

**GRAPHITE-EPOXY COMPOSITES**

Experimental/analytic comparisons considering composite panels with a cutout p 118 A86-13338

Measurement of preferential moisture ingress in composite wing/spar joints p 116 A86-16100

Effect of measured material properties on the finite element analysis of an OH-58 composite tail boom
[NASA-TM-86430] p 116 N86-12259

Abrasion behavior of aluminum and composite skin coupons, stiffened skins and stiffened panels representative of transport airplane structures
[NASA-TP-2520] p 100 N86-13316

**GRAVIMETERS**

Gravimetric surveying with MI-8 helicopters
p 125 N86-12680

**GRAVIMETRY**

Gravimetric surveying with MI-8 helicopters
p 125 N86-12680

**GROUND EFFECT (AERODYNAMICS)**

Ground effects on V/STOL and STOL aircraft: A survey
[NASA-TM-86825] p 89 N86-13299

**GROUND EFFECT MACHINES**

'But not with the greatest of ease' - A feasibility study of a human-powered ACV p 121 A86-14355

**GROUND TESTS**

Radio frequency chamber improves LAMPS Mk III testing p 112 A86-15526

Flutter clearance tests on a Transavia PL-12/T-400 Skyfarmer
[AD-A157212] p 110 N86-12234

**GUIDE VANES**

Effects of tip endwall contouring on the three-dimensional flow field in an annular turbine nozzle guide vane. I - Experimental investigation
[ASME PAPER 85-GT-71] p 77 A86-13065

Simulation of the effects of shock wave passing on a turbine rotor blade
[ASME PAPER 85-GT-112] p 77 A86-13067

Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation
[AD-A157108] p 107 N86-12229

Wind tunnel turning vanes of modern design
[NASA-TM-87146] p 113 N86-12239

**GUST LOADS**

The numerical computation of aircraft response to arbitrary vertical gust distributions p 110 A86-14534

## H

**HANDBOOKS**

Statistical sampling of aircraft operations at non-towered airports
[AD-A157095] p 128 N86-13051

**HARDWARE**
Hardware integrity — description of new 32-bit microprocessor architecture for increased air safety
p 126 A86-13049

**HARMONIC CONTROL**
The effect of higher harmonic control (HHC) on a four-bladed hingeless model rotor p 99 A86-16124

**HARMONIC OSCILLATION**
Study of the influence of an oscillating spoiler on the surrounding aerodynamic field
[IMFL-3119] p 90 N86-13303

**HEAD FLOW**
Calculation of supersonic inviscid flow past a plane air intake element with an isolated head wave
p 79 A86-13364

**HEAT EXCHANGERS**
Heat transfer and pressure drop performance of a finned-tube heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel
[NASA-TM-87151] p 123 N86-13677

**HEAT FLUX**
High-temperature thermocouple and heat flux gauge using a unique thin film-hardware hot junction
[ASME PAPER 85-GT-18] p 117 A86-13059

**HEAT RESISTANT ALLOYS**
Atom-probe microanalysis of a nickel-base superalloy
p 114 A86-12989
Cumulative-damage modeling of fatigue crack growth in turbine engine materials p 105 A86-13589

**HEAT TRANSFER**
High-temperature thermocouple and heat flux gauge using a unique thin film-hardware hot junction
[ASME PAPER 85-GT-18] p 117 A86-13059
Local heat-transfer measurements on a large scale-model turbine blade airfoil using a composite of a heater element and liquid crystals
[ASME PAPER 85-GT-59] p 117 A86-13061
The effect of the deflector type on internal heat transfer in blades with transverse coolant flow
p 120 A86-13673
Ribbon-burner simulation of T-700 turbine shroud for ceramic-lined seals research p 106 A86-15225
Experimental study of ceramic-coated tip seals for turbojet engines p 121 A86-15227
Heat transfer and pressure drop performance of a finned-tube heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel
[NASA-TM-87151] p 123 N86-13677

**HEAT TRANSFER COEFFICIENTS**
Local heat-transfer measurements on a large scale-model turbine blade airfoil using a composite of a heater element and liquid crystals
[ASME PAPER 85-GT-59] p 117 A86-13061

**HEAT TRANSMISSION**
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

**HEATING EQUIPMENT**
Constant temperature heaters for the repair of composite structures p 115 A86-13174

**HEAVY LIFT AIRSHIPS**
Aeromechanical stability analysis of a hybrid heavy lift multirotor vehicle in hover p 110 A86-14530

**HELICAL FLOW**
Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[NASA-TM-87116] p 129 N86-14006

**HELICOPTER CONTROL**
The Autonomous Helicopter System
p 75 A86-15285

**HELICOPTER DESIGN**
The Autonomous Helicopter System
p 75 A86-15285
Tomorrow's fleet - The light helicoper family (LHX)
p 98 A86-16097
Advanced technology helicopter landing gear preliminary design investigation
[AD-A156816] p 101 N86-13325

**HELICOPTER PERFORMANCE**
Impact of flying qualities on mission effectiveness for helicopter air combat p 110 A86-14531

**HELICOPTER WAKES**
Studies of rotor-airframe interactions in forward flight
[AIAA PAPER 85-5015] p 97 A86-14458

**HELICOPTERS**
Analytical method for considering the elasticity of the blades in the aerodynamic calculation of a helicopter propeller p 96 A86-13421
Some recent advances in computational aerodynamics for helicopter applications
[NASA-TM-86777] p 87 N86-12207
New passive helicopter detector
[DE85-015160] p 123 N86-12595
Gravimetric surveying with Mi-8 helicopters
p 125 N86-12980
The helicopter to fixed wing conversion program: A critical review
[AD-A158827] p 125 N86-12988
Assessment of aerodynamic and dynamic models in a comprehensive analysis
[NASA-TM-86835] p 79 N86-13296
Tradeoff analysis of technology needs for public service helicopters
[NASA-CR-3827] p 100 N86-13317
Advanced technology helicopter landing gear preliminary design investigation
[AD-A156816] p 101 N86-13325
Transmission acoustic vibration testing
[AD-A159022] p 101 N86-13326

**HIGH ALTITUDE**
Aeronautical technology 2000: A projection of advanced vehicle concepts
[NASA-CR-176322] p 130 N86-13236
Heat transfer and pressure drop performance of a finned-tube heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel
[NASA-TM-87151] p 123 N86-13677

**HIGH LEVEL LANGUAGES**
Advanced avionics computer architecture. Volume 1. Executive summary
[AD-A158119] p 104 N86-12222
Advanced avionics computer architecture. Volume 2. Instruction set architecture specification
[AD-A158120] p 104 N86-12223

**HIGH PRESSURE**
Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation
[AD-A157108] p 107 N86-12229
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 1
[NASA-CR-174823-VOL-1] p 106 N86-13328
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 2
[NASA-CR-174823-VOL-2] p 106 N86-13329
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 3
[NASA-CR-174823-VOL-3] p 106 N86-13330

**HIGH REYNOLDS NUMBER**
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302

**HIGH SPEED**
Experimental study of the combustion of gas-air mixtures in a channel and the diffusion combustion in a slipstream at high velocities
[AD-A157495] p 116 N86-12271

**HIGH SPEED PHOTOGRAPHY**
Response determination of propeller to bird strike using high speed photography p 90 A86-15306

**HIGH TEMPERATURE TESTS**
Adhesive system for high temperature destructive testing of composite structures p 115 A86-13101

**HISTORIES**
Studies in the history and theory of the development of science and technology in the fields of aviation, rocketry, and space. Number 3 — Russian book
p 131 A86-13462

**HOLOGRAPHIC INTERFEROMETRY**
Application of pulsed reflection holography to material testing p 122 A86-16090

**HORIZONTAL FLIGHT**
Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight
p 98 A86-16123

**HOT CORROSION**
Protecting gas turbine components - The relative durability of a conventional and a platinum-modified aluminide coating p 114 A86-13005

**HOTSHOT WIND TUNNELS**
Subsonic thermal wind tunnel with an Eiffel chamber
p 112 A86-13443

**HOUSINGS**
Length adjustable strut link with low aerodynamic drag
[AD-D011861] p 107 N86-12232

**HOVERING**
Velocity measurements in the near field of a rotor blade in hover
[AIAA PAPER 86-0013] p 84 A86-14457

**HOVERING STABILITY**
Longitudinal stability of a hovering, tethered rotorcraft
p 109 A86-14235
Stability and control of VTOL capable airships in hovering flight p 109 A86-14236
Aeromechanical stability analysis of a hybrid heavy lift multirotor vehicle in hover p 110 A86-14530

**HUBS**
Preliminary report on in-flight measurement of rotor hub drag and lift using the RSRA
[NASA-TM-86764] p 100 N86-13319
Hub effects in propeller design and analysis
[AD-A158853] p 108 N86-12331

**HUGHES AIRCRAFT**
A microprocessor-based digital voice network
p 118 A86-13221

**HUMAN FACTORS ENGINEERING**
An analysis of the application of AI to the development of intelligent aids for flight crew tasks
[NASA-CR-3944] p 90 N86-12212
Alerted monitors: Human operators aided by automated detectors
[PB86-222750] p 126 N86-13606

**HYDRAULIC EQUIPMENT**
Fluid machines: Expanding the limits, past and future
[NASA-TM-87161] p 107 N86-12227

**HYDRODYNAMICS**
Quasi-solutions of an inverse boundary value problem of hydroaerodynamics p 120 A85-13983

**HYDROMECHANICS**
Aerohydromechanics — Russian book
p 82 A86-13456

**HYPERSONIC BOUNDARY LAYER**
The effect of the bluntness and the half-angle of a cone on the turbulent transition of a boundary layer at free-stream Mach 6 p 80 A86-12391

**HYPERSONIC FLOW**
Hypersonic flow past non-slender wedges, cones and ogives in oscillation p 76 A86-13047
Aerodynamic characteristics of a finite-aspect-ratio wing in hypersonic flow of a radiating gas p 78 A86-13359
Flow of a diatomic rarefied gas around a cone
p 78 A86-13360

**HYPERSONIC TEST APPARATUS**
Influence of unsteady flow effects on the length of operation of a hypersonic shock tunnel
p 112 A86-13428

I

**ICE FORMATION**
Icing wind tunnel tests on the CSIRO liquid water probe p 102 A86-14220
Ice shapes and the resulting drag increase for a NACA 0012 airfoil
[AIAA PAPER 84-0109] p 90 A86-14427
Heat transfer and pressure drop performance of a finned-tube heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel
[NASA-TM-87151] p 123 N86-13677

**ICE PREVENTION**
Structural bonding with polysulfide adhesive on B-1B aircraft p 94 A86-13108

**IDEAL FLUIDS**
An analysis of separated flow of an ideal fluid past a finite-aspect-ratio mechanized wing p 80 A86-13385
Certain problems of fluid flow near the core of a spiral discontinuity p 120 A86-13424

**IDEAL GAS**
Determination of the shape of a profile from a specified chord diagram of Mach numbers in transonic flow
p 80 A86-13397
A numerical method for calculating internal subsonic swirling flows of an ideal gas p 85 A86-14579
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

**IDENTIFYING**
AIRID - An application of the KAS/Prospector expert system builder to airplane identification
p 128 A86-15283

**IMPACT TESTS**
Response determination of propeller to bird strike using high speed photography p 90 A86-15306

**IMPLOSIONS**
Radiative gasdynamic processes in imploding discharges in a plasmodynamic magnetoplasma compressor p 129 A86-13031

**IMPROVEMENT**
Wind tunnel turning vanes of modern design
[NASA-TM-87146] p 113 N86-12239

**IN-FLIGHT MONITORING**
X-29 flight testing p 95 A86-13213
Grumman's automated test systems
p 111 A86-13214
A programmable data acquisition system with integrated test and calibration facilities — in-flight aircraft testing
p 102 A86-13215
The in-flight simulation program at the NAE Flight Research Laboratory p 96 A86-14356
Preliminary report on in-flight measurement of rotor hub drag and lift using the RSRA
[NASA-TM-86764] p 100 N86-13319

**INCOMPRESSIBLE FLOW**
The effect of a perforated wall on incompressible flow past a U-shaped vortex p 81 A86-13406

Quasi-solutions of an inverse boundary value problem of hydroaerodynamics p 120 A86-13969

Viscous flow results for the vortex-airfoil interaction problem
[AIAA PAPER 85-4053] p 83 A86-14451

Doublet strip method for oscillating swept tapered wings in incompressible flow p 85 A86-14537

**INDUSTRIES**

West Europe report: Science and technology
[JPRS-WST-85-031] p 123 N86-13616

**INERTIAL CONFINEMENT FUSION**

China report: Science and technology
[JPRS-CST-85-029] p 122 N86-12446

**INERTIAL NAVIGATION**

Requirements for gyroscopes for inertial navigation p 93 A86-13576

**INFLUENCE COEFFICIENT**

Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections
[NASA-CR-177992] p 86 N86-12204

**INFRARED IMAGERY**

Infrared flight simulation using computer generated imagery p 103 A86-15378

**INFRARED RADIATION**

Radiometric characterization methods for Infrared Countermeasures Systems p 103 A86-15314

**INLET FLOW**

Calculation of flow around rotating circular cascades with allowance for circumferential flow nonuniformity induced by a perturbation at the inlet p 82 A86-13426

Evaluation of a method for analyzing the aperture region of two-dimensional external compression inlets
[AIAA PAPER 85-3072] p 83 A86-14432

**INSTRUMENT APPROACH**

An analytical comparison of three visual approach slope indicators: VASIS, T-VASIS and PAPI
[ARL/SYS-R-33] p 93 N86-13309

**INSTRUMENT FLIGHT RULES**

Ground-simulation investigation of VTOL airworthiness criteria for terminal area operations p 90 A86-14237

**INSTRUMENT LANDING SYSTEMS**

FAA (Federal Aviation Administration) could improve overall aviation safety and reduce costs associated with airport instrument landing systems
[PB85-195444] p 91 N86-12215

**INTEGRAL EQUATIONS**

Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

**INTEGRATED CIRCUITS**

Conformal coating for surface mount assembly p 115 A86-13118

**INTERACTIONAL AERODYNAMICS**

Experimental evaluation of heavy fan-high-pressure compressor interaction in a three-shaft engine. I - Experimental setup and results
[ASME PAPER 85-GT-173] p 104 A86-13053

Numerical analysis of fully three-dimensional periodic flows through a turbine stage
[ASME PAPER 85-GT-57] p 78 A86-13060

Propagation of small perturbations during the interaction of nonviscous jets p 80 A86-13390

Viscous flow results for the vortex-airfoil interaction problem
[AIAA PAPER 85-4053] p 83 A86-14451

Studies of rotor-airframe interactions in forward flight
[AIAA PAPER 85-5015] p 97 A86-14458

Multistage compressor stator/rotor interaction p 85 A86-14556

Measurement of the heterogeneous recombination probability of oxygen atoms in the course of supersonic dissociated gas flow interaction with solid body surfaces p 85 A86-14743

Pressure fluctuations on rotor blades generated by blade-vortex interaction p 86 A86-16122

**INTERPLANETARY SPACE**

USSR report: Space
[JPRS-USP-85-005] p 131 N86-14111

**INVERTED CONVERTERS (DC TO AC)**

Two-hundred to 300 KVA conditioned power system - development, phase 1
[AD-A158620] p 125 N86-13832

**INVESTMENT CASTING**

Precision casting at Rolls-Royce p 121 A86-14973

**INVISCID FLOW**

Calculation of supersonic inviscid flow past a plane air intake element with an isolated head wave p 79 A86-13364

A joint analysis of the boundary layer and inviscid flow around the axisymmetric rear section of a fuselage p 79 A86-13373

Propagation of small perturbations during the interaction of nonviscous jets p 80 A86-13390

GRUMFOIL: A computer code for the viscous transonic flow over airfoils
[NASA-CR-3806] p 86 N86-12202

An improved viscid/inviscid interaction procedure for transonic flow over airfoils
[NASA-CR-3805] p 87 N86-12208

An evaluation of four methods of numerical analysis for two-dimensional airfoil flows. Revision
[AD-A157248] p 87 N86-12209

Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[AD-A157750] p 89 N86-13301

**ISOLATION**

The evaluation of failure detection and isolation algorithms for restructurable control
[NASA-CR-177983] p 93 N86-13310

**ISOPERIMETRIC PROBLEM**

Using isoperimetric inequalities for the two-sided estimation of the torsional stiffness of a prismatic bar p 119 A86-13410

**ITALY**

Certification granted to Franco-Italian ATR 42 p 92 N86-13617

ATR 42 production work in French, Italian plants detailed p 76 N86-13618

**ITERATIVE SOLUTION**

A new fast solver procedure applied to the BGK computer program for transonic flow past an aerofoil p 83 A86-14360

## J

**JACKS (LIFTS)**

Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections
[NASA-CR-177992] p 86 N86-12204

**JAMMING**

Radiometric characterization methods for Infrared Countermeasures Systems p 103 A86-15314

**JATO ENGINES**

A brief history of the first U.S. JATO flight tests of August 1941
[IAF PAPER 85-453] p 131 A86-15913

**JET AIRCRAFT**

Thrust and drag: Its prediction and verification --- Book p 96 A86-14161

The C-17: We need it yesterday
[AD-A157147] p 99 N86-12219

Japanese report on China's F-8 fighter p 11, N86-12405

**JET AIRCRAFT NOISE**

Acoustic characteristics of models of ejector suppressors of jet noise p 129 A86-13416

Review of recent research on interior noise of propeller aircraft p 97 A86-14527

**JET ENGINE FUELS**

Composition and photochemical reactivity of turbine engine exhaust
[AD-A157643] p 107 N86-12230

**JET ENGINES**

Materials and manufacturing processes for advanced jet engines p 105 A86-13173

Test of jet engine turbine blades by thermography p 106 A86-15410

**JET EXHAUST**

Boundary-layer development on the afterbody of an engine nacelle p 82 A86-13532

Analysis of particulates in the exhaust plume of a J52-P3 turbojet engine at military power
[AD-A157840] p 107 N86-12231

**JET FLOW**

The linear theory of a profile in a compressible gas with additional jet flow p 78 A86-13351

Separated flow past a sharp edge according to a reverse-jet scheme p 120 A86-13430

Certain properties of two-dimensional flows in the case of flow past bodies with jets p 82 A86-13431

**JET IMPINGEMENT**

An experimental study of a vacuum water-air ejector with a multichannel liquid-supply nozzle ensuring jet-pair collision p 119 A86-13382

**JET MIXING FLOW**

An experimental study of a vacuum water-air ejector with a multichannel liquid-supply nozzle ensuring jet-pair collision p 119 A86-13382

Propagation of small perturbations during the interaction of nonviscous jets p 80 A86-13390

**JOINTS (JUNCTIONS)**

Measurement of preferential moisture ingress in composite wing/spar joints p 116 A86-16100

## K

**KALMAN FILTERS**

Missile guidance based on Kalman filter estimation of target maneuver p 102 A86-12983

Discovery of the Kalman filter as a practical tool for aerospace and industry
[NASA-TM-86847] p 94 N86-13311

**KARMAN-BODEWADT FLOW**

Some solutions to the Karman equation describing flow past the salient points of a profile p 79 A86-13363

## L

**LAMINAR BOUNDARY LAYER**

Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302

**LAMINAR FLOW**

Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections
[NASA-CR-177992] p 86 N86-12204

Effect of surface waviness on a supercritical laminar-flow-control airfoil
[NASA-TM-85705] p 86 N86-12206

Ground vibration test of the laminar flow control JStar airplane
[NASA-TM-86396] p 100 N86-13321

**LAMINAR FLOW AIRFOILS**

Unsteady aerodynamics of airfoils oscillating in and out of dynamic stall
[AIAA PAPER 85-4076] p 84 A86-14453

The laminar airliner - Prospects and problems --- review of boundary layer control research p 96 A86-14822

**LAMINATES**

Dynamic response of a laminated plate with friction damping
[ASME PAPER 85-DET-16] p 122 A86-16032

**LANDING GEAR**

Advanced technology helicopter landing gear preliminary design investigation
[AD-A158816] p 101 N86-13325

**LANDING SIMULATION**

Ground-simulation investigation of VTOL airworthiness criteria for terminal area operations p 90 A86-14237

**LANDING SITES**

CBR (California Bearing Ratio) design of flexible airfield pavements with case study
[AD-A158101] p 113 N86-12242

A durable airfield marking system
[AD-A157953] p 113 N86-13339

**LANGUAGE PROGRAMMING**

Advanced avionics computer architecture. Volume 1. Executive summary
[AD-A158119] p 104 N86-12222

**LASER ANEMOMETERS**

Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[AD-A157750] p 89 N86-13301

**LASER APPLICATIONS**

Optical communication between aircraft in low-visibility atmosphere using diode lasers p 122 A86-15584

**LASER DOPPLER VELOCIMETERS**

BLR studies on conic model with LDA in FL-1 wind tunnel p 87 N86-12434

Optical technique to study the impact of heavy rain on aircraft performance
[NASA-CR-177989] p 123 N86-12580

**LATERAL CONTROL**

Wing structure design for maximum aileron efficiency p 95 A86-13368

**LAW (JURISPRUDENCE)**

National airspace system, system requirements specification
[AD-A157944] p 94 N86-13312

**LEADING EDGES**

A study of heat transfer on wedges with a swept leading edge and a sharply bent generatrix p 81 A86-13399

Juncture flow control using leading-edge fillets
[AIAA PAPER 85-4097] p 84 A86-14454

**LEARNING MACHINES**

An application of adaptive learning to malfunction recovery
[AD-A158129] p 110 N86-12236

**LEGAL LIABILITY**

Liability of air traffic control agencies and airport operators in civil law jurisdictions p 130 A86-14372

**LIE GROUPS**

A method for calculating flow fields around moving bodies
[NAL-TR-859T] p 88 N86-13288

**LIFE (DURABILITY)**
A durable airfield marking system
[AD-A157953] p 113 N86-13339
**LIFE CYCLE COSTS**
Materials and manufacturing processes for advanced jet engines p 105 A86-13173
**LIFE SCIENCES**
USSR report: Space
[JPRS-USP-85-005] p 131 N86-14111
**LIFT**
Characteristics of the lifting properties of aircraft with sweptforward wings at supersonic velocities
p 96 A86-13371
Effect of cantilevers on the lift characteristics of a thin swept wing and vortex-wake stability p 81 A86-13422
Fluid forces on two circular cylinders in crossflow
[DE85-014294] p 124 N86-13704
**LIFTING ROTORS**
Stability and control of VTOL capable airships in hovering flight p 109 A86-14236
**LIGHT AIRCRAFT**
Tomorrow's fleet - The light helictoper family (LHX)
p 96 A86-16097
**LIGHTNING**
Interpretation of F-106B in-flight lightning signatures
[NASA-CR-178387] p 100 N86-13320
**LIGHTNING SUPPRESSION**
Electrically conductive structural adhesive
p 115 A86-13170
**LIKELIHOOD RATIO**
The evaluation of failure detection and isolation algorithms for restructurable control
[NASA-CR-177983] p 93 N86-13310
**LIMITS (MATHEMATICS)**
Interactive aircraft flight control and aeroelastic stabilization
[NASA-CR-176323] p 110 N86-12233
**LINEAR SYSTEMS**
A method to stabilize linear systems using eigenvalue gradient information
[NASA-TP-2479] p 128 N86-13946
**LINES (GEOMETRY)**
A method for arranging nodes along the lines of a computational grid during the numerical solution of problems in mathematical physics p 127 A86-13409
**LIQUID-GAS MIXTURES**
An experimental study of a vacuum water-air ejector with a multichannel liquid-supply nozzle ensuring jet-pair collision p 119 A86-13362
**LOADING MOMENTS**
Algorithms for the reduction of wind-tunnel data derived from strain gauge force balances
[ARL/AERO-R-164] p 113 N86-13337
**LOADS (FORCES)**
Optimization of structural load-bearing designs using anisotropic models according to aeroelasticity conditions
p 96 A86-13438
Cutouts in load-bearing structures --- Russian book
p 120 A86-13403
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 2: Final definition of Helix and Felix
[AD-A158822] p 101 N86-13322
Digital servocontroller system. Volume 4. Results and conclusions
[AD-A159068] p 111 N86-13335
**LONG DURATION SPACE FLIGHT**
USSR report: Space
[JPRS-USP-85-005] p 131 N86-14111
**LONGITUDINAL CONTROL**
A preliminary evaluation of the generalized likelihood ratio for detecting and identifying control element failures in a transport aircraft
[NASA-TM-87620] p 111 N86-13332
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334
**LONGITUDINAL STABILITY**
Longitudinal stability of a hovering, tethered rotorcraft
p 109 A86-14235
The numerical computation of aircraft response to arbitrary vertical gust distributions p 110 A86-14534
**LOW ASPECT RATIO WINGS**
Panel design for optimum strength and stability with allowance for the nonuniformity of heating
p 119 A86-13357
Wing structure design for maximum aileron efficiency
p 95 A86-13368
Pressure-distribution measurements on a transonic low-aspect ratio wing
[NASA-TM-86683] p 90 N86-13304
**LOW REYNOLDS NUMBER**
Diffuser parameter optimization for low Reynolds numbers using experimental data p 111 A86-13400
Evaluation of low Reynolds number turbulence models for attached and separated flows p 121 A86-14509
**LOW VISIBILITY**
Optical communication between aircraft in low-visibility atmosphere using diode lasers p 122 A86-15584
**LOWER ATMOSPHERE**
Wind shear induced by solitary waves in the lower atmosphere
[IAF PAPER 85-410] p 125 A86-15886

**M**

**MACH NUMBER**
A method for measuring the direction and the Mach number of a three-dimensional supersonic nozzle
p 80 A86-13392
Determination of the shape of a profile from a specified chord diagram of Mach numbers in transonic flow
p 80 A86-13397
Using suction for increasing Mach numbers in a perforated test section with a subsonic nozzle --- of wind tunnel p 112 A86-13405
Critical values of the Mach number of a radial airfoil cascade --- for determining turboprop engine efficiency
p 105 A86-13408
Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[NASA-TM-87116] p 129 N86-14006
**MAGNETIC FIELDS**
Data analysis of airborne electromagnetic bathymetry
[AD-A157132] p 125 N86-12744
**MAINTENANCE**
Aircraft field repair p 115 A86-13172
Portable computerized tester improves flight-line maintenance p 121 A86-15529
**MALFUNCTIONS**
An application of adaptive learning to malfunction recovery
[AD-A158129] p 110 N86-12236
**MAN MACHINE SYSTEMS**
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334
**MAN OPERATED PROPULSION SYSTEMS**
'But not with the greatest of ease' - A feasibility study of a human-powered ACV p 121 A86-14355
**MANAGEMENT**
National airspace system, system requirements specification
[AD-A157944] p 94 N86-13312
**MANAGEMENT METHODS**
NASA flight operations review
[NASA-CR-176393] p 91 N86-13306
**MANUFACTURING**
The use of automated riveting systems in aircraft construction p 95 A86-13127
Materials and manufacturing processes for advanced jet engines p 105 A86-13173
**MARKERS**
A durable airfield marking system
[AD-A157953] p 113 N86-13339
**MATERIALS SCIENCE**
National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings
p 115 A86-13076
**MATERIALS TESTS**
Methods of constructing R-curves and application of these curves for evaluation of materials (Review)
p 117 A86-13011
Application of pulsed reflection holography to material testing p 122 A86-16090
**MATHEMATICAL MODELS**
A direct-inverse method for transonic and separated flows about airfoils
[NASA-CR-176403] p 89 N86-13300
**MATRIX METHODS**
An algorithm for calculating the coupling between matrices of elastic influence coefficients for two systems of computational points p 119 A86-13362
Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections
[NASA-CR-177002] p 86 N86-12204
**MCDONNELL DOUGLAS AIRCRAFT**
Douglas plans continuing upgrades to maintain MD-80 competitiveness p 98 A86-15899
**MEASURING INSTRUMENTS**
High-temperature thermocouple and heat flux gauge using a unique thin film-hardware hot junction
[ASME PAPER 85-GT-18] p 117 A86-13059
New methods of measuring strain and temperature in a turbine engine p 118 A86-13336
**MECHANICAL DEVICES**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314
**MECHANICAL DRIVES**
Pneumatic actuator device
[AD-D011794] p 99 N86-12217
Two-hundred to 300 KVA conditioned power system - development, phase 1
[AD-A158820] p 125 N86-13832
**MECHANICAL PROPERTIES**
Effect of measured material properties on the finite element analysis of an OH-58 composite tail boom
[NASA-TM-86430] p 116 N86-12259
**MEDICAL SERVICES**
Tradeoff analysis of technology needs for public service helicopters
[NASA-CR-3927] p 100 N86-13317
**METAL MATRIX COMPOSITES**
Metals anad plastics - State of the art and perspectives
[MBB-Z-49-85-OE] p 116 A86-14474
Polymer, metal and ceramic matrix composites for advanced aircraft engine applications
[NASA-TM-87132] p 117 N86-13407
**METAL PLATES**
Fracture toughness characterization of light alloys for aeronautical use p 114 A86-12761
**METEOROLOGICAL RADAR**
Evaluation of meteorological airborne Doppler radar. I Dual-Doppler analyses of air motions. II - Triple-Doppler analyses of air motions p 103 A86-14223
**METEOROLOGICAL SATELLITES**
Introduction to operational ASDAR system
p 125 N86-12015
**MICROANALYSIS**
Atom-probe microanalysis of a nickel-base superalloy
p 114 A86-12989
**MICROCOMPUTERS**
Computer graphics applications to crew displays
p 128 N86-14104
**MICROELECTRONICS**
West Europe report: Science and technology
[JPRS-WST-85-031] p 123 N86-13816
**MICROPROCESSORS**
Hardware integrity --- description of new 32-bit microprocessor architecture for increased air safety
p 126 A86-13049
A microprocessor-based digital voice network
p 118 A86-13221
China report: Science and technology
[JPRS-CST-85-029] p 122 N86-12446
**MICROSTRUCTURE**
Atom-probe microanalysis of a nickel-base superalloy
p 114 A86-12989
**MICROWAVE SPECTROMETERS**
Method to detect ethylene glycol in gaseous mixtures
[AD-A158109] p 116 N86-12272
**MILITARY AIRCRAFT**
Powered-lift technology on the threshold
p 96 A86-14245
Evaluation of a method for analyzing the aperture region of two-dimensional external compression inlets
[AIAA PAPER 85-3072] p 83 A86-14432
The fundamentals of aircraft combat survivability analysis and design --- Book p 97 A86-14496
Counterrotating intershaft seals for advanced engines
p 121 A86-14554
A brief history of the first U.S. JATO flight tests of August 1941
[IAF PAPER 85-453] p 131 A86-15913
Physical distribution system for aircraft external fuel tanks-survey
[AD-A158275] p 101 N86-13324
**MILITARY HELICOPTERS**
Impact of flying qualities on mission effectiveness for helicopter air combat p 110 A86-14531
Radio frequency chamber improves LAMPS Mk III testing p 112 A86-15526
Army VTOL research and development - The first century p 75 A86-16096
Tomorrow's fleet - The light helictoper family (LHX)
p 96 A86-16097
**MILITARY OPERATIONS**
The C-17: We need it yesterday
[AD-A157147] p 99 N86-12219
**MILITARY TECHNOLOGY**
Altimeters to meet military low level needs
p 102 A86-13546
Japanese report on China's F-8 fighter
p 111 N86-12405
**MISSILE CONTROL**
Missile guidance based on Kalman filter estimation of target maneuver p 102 A86-12663

**MISSILE STRUCTURES**
Nondestructive test methods for composite structures
p 118 A86-13147

**MISSILE TRACKING**
Airborne telemetry - The advanced range instrumentation aircraft p 92 A86-13225

**MIXTURES**
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302

**MODELS**
The mission oriented terminal area simulation facility
[NASA-TM-87621] p 128 N86-13944

**MODULES**
The RAJPO GPS range equipment family — navigation modules for various military applications
p 92 A86-13216

**MOIRE FRINGES**
Application of computerized data acquisition and data processing to the surface contouring of large structures
p 118 A86-13342

**MOISTURE CONTENT**
Measurement of preferential moisture ingress in composite wing/spar joints p 118 A86-16100

**MOMENTUM**
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows
[AD-A157078] p 123 N86-12552

**MONITORS**
Alerted monitors: Human operators aided by automated detectors
[PB85-222750] p 128 N86-13906

## N

**NACELLES**
Structural bonding with polysulfide adhesive on B-1B aircraft p 94 A86-13106
Boundary-layer development on the afterbody of an engine nacelle p 82 A86-13532

**NAP-OF-THE-EARTH NAVIGATION**
Impact of flying qualities on mission effectiveness for helicopter air combat p 110 A86-14531
LANTIRN - Turning night into day p 103 A86-15599

**NASA PROGRAMS**
NASA LeRC/Akron University Graduate Cooperative Fellowship Program and Graduate Student Researchers Program
[NASA-CR-174826] p 130 N86-13219

**NATIONAL AIRSPACE SYSTEM**
National airspace system, system requirements specification
[AD-A157944] p 94 N86-13312

**NAVIER-STOKES EQUATION**
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows
[AD-A157078] p 123 N86-12552
A method for calculating flow fields around moving bodies
[NAL-TR-859T] p 88 N86-13288
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293
Computational aspects of zonal algorithms for solving the compressible Navier-Stokes equations in three dimensions
[NASA-TM-86774] p 88 N86-13296

**NAVIGATION AIDS**
The RAJPO GPS range equipment family — navigation modules for various military applications
p 92 A86-13216

**NEAR FIELDS**
Velocity measurements in the near field of a rotor blade in hover
[AIAA PAPER 85-5013] p 84 A86-14457

**NETS**
Passive arm retention curtain
[AD-D011876] p 91 N86-13307

**NEUROLOGY**
Criteria for a state-of-the-art vision test system
[AD-A157099] p 126 N86-12973

**NICKEL ALLOYS**
Atom-probe microanalysis of a nickel-base superalloy
p 114 A86-12980

**NIGHT FLIGHTS (AIRCRAFT)**
LANTIRN - Turning night into day p 103 A86-15599

**NODES (STANDING WAVES)**
A method for arranging nodes along the lines of a computational grid during the numerical solution of problems in mathematical physics p 127 A86-13409

**NOISE (SOUND)**
Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[NASA-TM-87116] p 129 N86-14006

**NOISE PREDICTION (AIRCRAFT)**
Review of recent research on interior noise of propeller aircraft p 97 A86-14527

**NOISE REDUCTION**
Acoustic characteristics of models of ejector suppressors of jet noise p 129 A86-13416
Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[NASA-TM-87116] p 129 N86-14006
Some design philosophy for reducing the community noise of advanced counter-rotation propellers
[NASA-TM-87099] p 129 N86-14007

**NONDESTRUCTIVE TESTS**
Composite repairs — Book p 115 A86-13103
Nondestructive test methods for composite structures
p 118 A86-13147
Test of jet engine turbine blades by thermography
p 106 A86-15410
Application of pulsed reflection holography to material testing p 122 A86-16090

**NONISENTROPICITY**
Profiling of supersonic ducts with specified nonisentropic parameters at the exit p 79 A86-13375

**NOZZLE EFFICIENCY**
An experimental study of a vacuum water-air ejector with a multichannel liquid-supply nozzle ensuring jet-pair collision p 119 A86-13382

**NOZZLE FLOW**
Effects of tip endwall contouring on the three-dimensional flow field in an annular turbine nozzle guide vane. I - Experimental investigation
[ASME PAPER 85-GT-71] p 77 A86-13065
Calculation of flows in two- and three-dimensional nozzles by an approximate factorization method
p 77 A86-13294
Using suction for increasing Mach numbers in a perforated test section with a subsonic nozzle — of wind tunnel p 112 A86-13405

**NOZZLE GEOMETRY**
Diffuser parameter optimization for low Reynolds numbers using experimental data p 111 A86-13400
Compact gas ejector of a high degree of compression with spiral arrangement of the nozzles
p 82 A86-13433

**NUCLEAR EXPLOSION EFFECT**
Aircrew dose and engine dust ingestion from nuclear cloud penetration
[AD-A159246] p 101 N86-13327

**NUCLEAR EXPLOSIONS**
Aircrew dose and engine dust ingestion from nuclear cloud penetration
[AD-A159246] p 101 N86-13327

**NUCLEAR METEOROLOGY**
Aircrew dose and engine dust ingestion from nuclear cloud penetration
[AD-A159246] p 101 N86-13327

**NUCLEAR POWER PLANTS**
New passive helicopter detector
[DE85-015160] p 123 N86-12595

**NUCLEAR VULNERABILITY**
EC-135 fiber optic technology review
p 75 A86-15341
Fiber optic aircraft systems electromagnetic pulse (EMP) survivability p 103 A86-15342

**NUMERICAL ANALYSIS**
A method for numerical analysis of the aerodynamic characteristics of an aeroplane wing in the subcritical range of the flying velocity p 83 A86-13933
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows
[AD-A157078] p 123 N86-12552
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

## O

**OGIVES**
Hypersonic flow past non-slender wedges, cones and ogives in oscillation p 76 A86-13047

**OH-58 HELICOPTER**
Effect of measured material properties on the finite element analysis of an OH-58 composite tail boom
[NASA-TM-86430] p 116 N86-12259

**OILS**
Pressure-distribution measurements on a transonic low-aspect ratio wing
[NASA-TM-86683] p 90 N86-13304

**ONE DIMENSIONAL FLOW**
Calculation of unsteady flow in a two-stage gas turbine engine p 105 A86-13444

**OPENINGS**
Cutouts in load-bearing structures — Russian book
p 120 A86-13463

**OPERATING COSTS**
Selection of an optimal cost index for airline hub operation p 130 A86-14239

**OPTICAL COMMUNICATION**
Optical communication between aircraft in low-visibility atmosphere using diode lasers p 122 A86-15584

**OPTICAL COUNTERMEASURES**
Radiometric characterization methods for Infrared Countermeasures Systems p 103 A86-15314

**OPTICAL GYROSCOPES**
Requirements for gyroscopes for inertial navigation
p 93 A86-13576

**OPTIMAL CONTROL**
Air traffic prediction and optimal control of air transportation system — Russian book
p 90 A86-13452

**OPTIMIZATION**
Optimization of structural load-bearing designs using anisotropic models according to aeroelasticity conditions
p 96 A86-13438
Weight optimization of stiffened cylinders under axial compression p 120 A86-14348
Interactive aircraft flight control and aeroelastic stabilization
[NASA-CR-176323] p 110 N86-12233
A method to stabilize linear systems using eigenvalue gradient information
[NASA-TP-2479] p 128 N86-13946

**OPTOMETRY**
Criteria for a state-of-the-art vision test system
[AD-A157099] p 126 N86-12973

**OSCILLATING FLOW**
Statistical formulation of the objectives of the aerodynamic experiment p 80 A86-13381
Unsteady aerodynamics of airfoils oscillating in and out of dynamic stall
[AIAA PAPER 85-4078] p 84 A86-14453
Sound generation by flow over relatively deep cylindrical cavities p 129 A86-16058

**OSCILLATIONS**
Equations of rolling for a wheel with an elastic tire
p 96 A86-13369

**OUTLET FLOW**
Profiling of supersonic ducts with specified nonisentropic parameters at the exit p 79 A86-13375

**OUTPUT**
Two-hundred to 300 KVA conditioned power system - development, phase 1
[AD-A158820] p 125 N86-13832

**OXYGEN ATOMS**
Measurement of the heterogeneous recombination probability of oxygen atoms in the course of supersonic dissociated gas flow interaction with solid body surfaces
p 85 A86-14743

## P

**P-531 HELICOPTER**
Impact of flying qualities on mission effectiveness for helicopter air combat p 110 A86-14531

**PANEL METHOD (FLUID DYNAMICS)**
Characteristics of the lifting properties of aircraft with sweptforward wings at supersonic velocities
p 96 A86-13371
A solution of inverse problem for multi-element aerofoils through application of panel method p 83 A86-13546
Calculation of steady flow about propellers using a surface panel method p 85 A86-14559

**PANELS**
Aircraft interior panel test criteria derived from full-scale fire tests
[FAA/CT-85/23] p 91 N86-12214
Abrasion behavior of aluminum and composite skin coupons, stiffened skins and stiffened panels representative of transport airplane structures
[NASA-TP-2520] p 100 N86-13316

**PARACHUTE DESCENT**
Telemetry from experimental rescue- and recovery systems p 95 A86-13219

**PARACHUTE FABRICS**
Development and evaluation of a microburst test apparatus for use as a minimum destructive test for parachute material
[AD-A158110] p 123 N86-12620

**PARACHUTES**
Certain characteristics of parachute-wing aerodynamics p 80 A86-13389

Parachute recovery systems design manual, chapters 1 through 4 offprint
[AD-A157839] p 87 N86-12210
PARAMETER IDENTIFICATION
Missile guidance based on Kalman filter estimation of target maneuver p 102 A86-12683
Diffuser parameter optimization for low Reynolds numbers using experimental data p 111 A86-13400
Using isoperimetric inequalities for the two-sided estimation of the torsional stiffness of a prismatic bar p 119 A86-13410
PARTIAL DIFFERENTIAL EQUATIONS
Equations of rolling for a wheel with an elastic tire p 96 A86-13369
PARTICULATE SAMPLING
Analysis of particulates in the exhaust plume of a J52-P3 turbojet engine at military power
[AD-A157840] p 107 N86-12231
PARTICULATES
Analysis of particulates in the exhaust plume of a J52-P3 turbojet engine at military power
[AD-A157840] p 107 N86-12231
PASSENGER AIRCRAFT
Estimation of the deviation limits of the aircraft path parameters during automatic landing p 108 A86-13365
7J7 - Boeing sets the pace p 97 A86-14361
Douglas plans continuing upgrades to maintain MD-80 competitiveness p 98 A86-15999
Certification granted to Franco-Italian ATR 42 p 92 N86-13617
ATR 42 production work in French, Italian plants detailed p 76 N86-13618
PAVEMENTS
CBR (California Bearing Ratio) design of flexible airfield pavements with case study
[AD-A158101] p 113 N86-12242
A durable airfield marking system
[AD-A157953] p 113 N86-13339
PAYLOADS
Wing aspect ratio optimization related to payload and to fuel consumption of transport propeller airplanes
[SAWE PAPER 1615] p 98 A86-14975
PCM TELEMETRY
A programmable data acquisition system with integrated test and calibration facilities — in-flight aircraft testing p 102 A86-13215
An integrated solution for flight test data handling p 93 A86-13226
Canadian forces PCM telemetry processing and display system p 111 A86-13248
PERFORATED PLATES
Experimental/analytic comparisons considering composite panels with a cutout p 118 A86-13338
PERFORATING
Using suction for increasing Mach numbers in a perforated test section with a subsonic nozzle — of wind tunnel p 112 A86-13405
The effect of a perforated wall on incompressible flow past a U-shaped vortex p 81 A86-13406
PERFORMANCE PREDICTION
The performance of composite structures p 121 A86-14680
PERFORMANCE TESTS
Materials and manufacturing processes for advanced jet engines p 105 A86-13173
PHASE LOCK DEMODULATORS
An extended phase-lock technique for aided acquisition — in PM demodulators p 93 A86-13227
PHOTOCHEMICAL REACTIONS
Composition and photochemical reactivity of turbine engine exhaust
[AD-A157643] p 107 N86-12230
PILOT PERFORMANCE
Changes of flying skills during non-flight periods p 125 A86-13944
Pilot-oriented performance measurement
[AD-A158649] p 126 N86-13890
Effects of digital altimetry on pilot workload
[NASA-TM-86424] p 126 N86-13892
PILOT TRAINING
Changes of flying skills during non-flight periods p 125 A86-13944
The helicopter to fixed wing conversion program: A critical review
[AD-A156820] p 125 N86-12968
PILOTS (PERSONNEL)
Gravimetric surveying with MI-8 helicopters p 125 N86-12680
Passive arm retention curtain
[AD-D011876] p 91 N86-13307
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334
PISTON ENGINES
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 1
[NASA-CR-174923-VOL-1] p 108 N86-13328
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 2
[NASA-CR-174923-VOL-2] p 108 N86-13329
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 3
[NASA-CR-174923-VOL-3] p 108 N86-13330
PITCH (INCLINATION)
Air Force Academy Aeronautics Digest
[AD-A157215] p 76 N86-12200
PITCHING MOMENTS
Hypersonic flow past non-slender wedges, cones and ogives in oscillation p 76 A86-13047
PITOT TUBES
Performance of an alpha-vane and pitot tube in simulated heavy rain environment
[NASA-CR-176353] p 103 N86-12220
T-33 (Silver Star MK 3) pitot-static system calibration
[AD-A157854] p 104 N86-12221
PLANFORMS
Some solutions to the Karman equation describing flow past the salient points of a profile p 79 A86-13363
PLASMA COMPRESSION
Radiative gasdynamic processes in imploding discharges in a plasmodynamic magnetoplasma compressor p 129 A86-13031
PLASMA DYNAMICS
Radiative gasdynamic processes in imploding discharges in a plasmodynamic magnetoplasma compressor p 129 A86-13031
PLASMA JETS
Radiative gasdynamic processes in imploding discharges in a plasmodynamic magnetoplasma compressor p 129 A86-13031
PLASTIC AIRCRAFT STRUCTURES
Adhesive system for high temperature destructive testing of composite structures p 115 A86-13101
PLATINUM
Protecting gas turbine components - The relative durability of a conventional and a platinum-modified aluminide coating p 114 A86-13005
PLUMES
Analysis of particulates in the exhaust plume of a J52-P3 turbojet engine at military power
[AD-A157840] p 107 N86-12231
PNEUMATIC EQUIPMENT
A method for measuring the direction and the Mach number of a three-dimensional supersonic nozzle p 80 A86-13392
Pneumatic actuator device
[AD-D011794] p 99 N86-12217
POLICIES
Tradeoff analysis of technology needs for public service helicopters
[NASA-CR-3927] p 100 N86-13317
West Europe report: Science and technology
[JPRS-WST-85-031] p 123 N86-13616
POLITICS
Report of accomplishments under the airport improvement program
[AD-A156834] p 113 N86-12241
POLYMER MATRIX COMPOSITES
Composite repairs — Book p 115 A86-13103
POLYSULFIDES
A low temperature curing, quick repair, fuel resistant aircraft sealant p 115 A86-13082
Structural bonding with polysulfide adhesive on B-1B aircraft p 94 A86-13106
POROUS BOUNDARY LAYER CONTROL
Linear theory of an equivalent profile in the problem concerning the influence of porous flow boundaries p 81 A86-13411
POROUS WALLS
Linear theory of an equivalent profile in the problem concerning the influence of porous flow boundaries p 81 A86-13411
PORTABLE EQUIPMENT
Portable computerized tester improves flight-line maintenance p 121 A86-15528
POTENTIAL FLOW
A solution of inverse problem for multi-element aerofoils through application of panel method p 83 A86-13546
Unsteady potential flow for oscillating airfoils p 83 A86-14359
Solution of transonic flow past rotor blades using the conservative full potential equation
[AIAA PAPER 85-5012] p 84 A86-14456
POTENTIAL THEORY
A combined method for the analysis of the aerodynamic forces acting on an oscillating flight vehicle in supersonic flow p 79 A86-13380
POWDER (PARTICLES)
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302
POWER CONDITIONING
Two-hundred to 300 KVA conditioned power system - development, phase 1
[AD-A158820] p 125 N86-13632
POWER GAIN
ELT antenna gain distributions under simulated crash conditions p 92 A86-12698
POWERED LIFT AIRCRAFT
Ground-simulation investigation of VTOL airworthiness criteria for terminal area operations p 90 A86-14237
Powered-lift technology on the threshold p 96 A86-14245
PRECIPITATION HARDENING
Atom-probe microanalysis of a nickel-base superalloy p 114 A86-12969
PREDICTION ANALYSIS TECHNIQUES
Thrust and drag: Its prediction and verification — Book p 96 A86-14161
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows
[AD-A157078] p 123 N86-12552
PREDICTIONS
Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[NASA-TM-87116] p 129 N86-14006
PRESSURE
Effects of velocity profile and inclination on dual-jet-induced pressures on a flat plate in a crosswind
[NASA-CR-177361] p 87 N86-13287
PRESSURE DISTRIBUTION
Construction of equivalent profiles and approximate calculation of transonic flow past the root section of a swept wing p 80 A86-13396
Pressure fluctuations on rotor blades generated by blade-vortex interaction p 86 A86-16122
Effect of surface waviness on a supercritical laminar-flow-control airfoil
[NASA-TM-85705] p 86 N86-12206
Effects of velocity profile and inclination on dual-jet-induced pressures on a flat plate in a crosswind
[NASA-CR-177361] p 87 N86-13287
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[AD-A157750] p 89 N86-13301
Pressure-distribution measurements on a transonic low-aspect ratio wing
[NASA-TM-86683] p 90 N86-13304
PRESSURE GRADIENTS
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows
[AD-A157078] p 123 N86-12552
Heat transfer and pressure drop performance of a finned-tube heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel
[NASA-TM-87151] p 123 N86-13677
PRESSURE MEASUREMENT
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[AD-A157750] p 89 N86-13301
Pressure-distribution measurements on a transonic low-aspect ratio wing
[NASA-TM-86683] p 90 N86-13304
PRESSURE RATIO
Experimental evaluation of heavy fan-high-pressure compressor interaction in a three-shaft engine. I - Experimental setup and results
[ASME PAPER 85-GT-173] p 104 A86-13053
PRESSURE RECOVERY
Diffuser parameter optimization for low Reynolds numbers using experimental data p 111 A86-13400
Boundary-layer development on the afterbody of an engine nacelle p 82 A86-13532
PRISMATIC BARS
Using isoperimetric inequalities for the two-sided estimation of the torsional stiffness of a prismatic bar p 119 A86-13410
PROBABILITY THEORY
Estimation of the probability of a flight parameter exceeding a specified value under conditions of atmospheric turbulence p 108 A86-13355
PROBLEM SOLVING
Discovery of the Kalman filter as a practical tool for aerospace and industry
[NASA-TM-86847] p 94 N86-13311
PRODUCT DEVELOPMENT
The 'Super Etendard' is always of interest — transonic attack aircraft p 97 A86-14423
PRODUCTION ENGINEERING
Technological support for aircraft production — Russian book p 75 A86-13446

The performance of composite structures p 121 A86-14680

**PRODUCTION MANAGEMENT**

ATR 42 production work in French, Italian plants detailed p 76 N86-13618

**PRODUCTION PLANNING**

Technological support for aircraft production --- Russian book p 75 A86-13446

**PRODUCTIVITY**

Productivity improvements through the use of CAD/CAM p 121 A86-14538

**PROGRAM VERIFICATION (COMPUTERS)**

Development of a flight software testing methodology [NASA-CR-176391] p 128 N86-13922

**PROGRAMMING LANGUAGES**

Advanced avionics computer architecture. Volume 2. Instruction set architecture specification [AD-A158120] p 104 N86-12223

**PROJECT MANAGEMENT**

NASA flight operations review [NASA-CR-176393] p 91 N86-13306

**PROP-FAN TECHNOLOGY**

7J7 - Boeing sets the pace p 97 A86-14361

Separated flow unsteady aerodynamic theory p 85 A86-14529

Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A [NASA-TM-87116] p 129 N86-14006

**PROPELLANT TESTS**

Combustion related to solid-fuel ramjets p 116 A86-14566

**PROPELLER BLADES**

Calculation of steady flow about propellers using a surface panel method p 85 A86-14559

Response determination of propeller to bird strike using high speed photography p 90 A86-15308

Hub effects in propeller design and analysis [AD-A158653] p 108 N86-13331

Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A [NASA-TM-87116] p 129 N86-14006

**PROPELLER EFFICIENCY**

Wing aspect ratio optimization related to payload and to fuel consumption of transport propeller airplanes [SAWE PAPER 1615] p 98 A86-14975

**PROPELLERS**

Review of recent research on interior noise of propeller aircraft p 97 A86-14527

Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows [AD-A157078] p 123 N86-12552

Some design philosophy for reducing the community noise of advanced counter-rotation propellers [NASA-TM-87099] p 129 N86-14007

**PROPULSION SYSTEM CONFIGURATIONS**

A linear multivariable dynamical model of a supersonic inlet-engine combination p 85 A86-14560

**PROPULSION SYSTEM PERFORMANCE**

Fiber optics for propulsion control systems [ASME PAPER 84-GT-97] p 105 A86-13054

The influence of advanced propulsion on short- to medium-range transport design p 95 A86-13264

Subscale-model and full-scale engine mixed-flow exhaust system performance comparison p 106 A86-14528

**PROTECTIVE COATINGS**

Protecting gas turbine components - The relative durability of a conventional and a platinum-modified aluminide coating p 114 A86-13005

Conformal coating for surface mount assembly p 115 A86-13118

**PUBLIC HEALTH**

Tradeoff analysis of technology needs for public service helicopters [NASA-CR-3927] p 100 N86-13317

**PUBLIC RELATIONS**

Some design philosophy for reducing the community noise of advanced counter-rotation propellers [NASA-TM-87099] p 129 N86-14007

**PULSE CODE MODULATION**

Air Force flight test instrumentation system p 102 A86-13202

Canadian forces PCM telemetry processing and display system p 111 A86-13248

**PULSED RADIATION**

Interpretation of F-106B in-flight lightning signatures [NASA-CR-176387] p 100 N86-13320

## Q

**QUALITY CONTROL**

The performance of composite structures p 121 A86-14680

## R

**RADAR ABSORBERS**

Radio-absorbing materials [AD-A157496] p 122 N86-12495

**RADAR TRACKING**

Using roll-angle measurements to track aircraft maneuvers p 92 A86-12677

**RADIAL DISTRIBUTION**

Critical values of the Mach number of a radial airfoil cascade --- for determining turboprop engine efficiency p 105 A86-13408

**RADIANCE**

Infrared flight simulation using computer generated imagery p 103 A86-15378

**RADIATION DAMAGE**

EC-135 fiber optic technology review p 75 A86-15341

**RADIATION EFFECTS**

Fiber optics in adverse environments II; Proceedings of the Meeting, San Diego, CA, August 22-24, 1984 [SPIE-506] p 129 A86-15340

**RADIATION HARDENING**

EC-135 fiber optic technology review p 75 A86-15341

**RADIATION MEASUREMENT**

Radiometric characterization methods for Infrared Countermeasures Systems p 103 A86-15314

**RADIATION SHIELDING**

Aircrew dose and engine dust ingestion from nuclear cloud penetration [AD-A159246] p 101 N86-13327

**RADIO ALTIMETERS**

Altimeters to meet military low level needs p 102 A86-13548

**RADIO FREQUENCY SHIELDING**

Radio frequency chamber improves LAMPS Mk III testing p 112 A86-15526

**RADIOMETERS**

Radiometric characterization methods for Infrared Countermeasures Systems p 103 A86-15314

**RAIN**

Performance of an alpha-vane and pitot tube in simulated heavy rain environment [NASA-CR-176353] p 103 N86-12220

**RAIN IMPACT DAMAGE**

Optical technique to study the impact of heavy rain on aircraft performance [NASA-CR-177989] p 123 N86-12580

**RAMJET ENGINES**

Solid fuel ramjet simulator results - Experiment and analysis in cold flow --- solid fuel ramjet p 106 A86-14562

Combustion related to solid-fuel ramjets p 116 A86-14566

**RANDOM LOADS**

A model for the life variance of a structural element under irregular loading p 119 A86-13386

**RANDOM VIBRATION**

Modeling realistic environmental stresses on external stores p 95 A86-13275

**RAREFIED GAS DYNAMICS**

Flow of a diatomic rarefied gas around a cone p 78 A86-13360

**REACTOR MATERIALS**

New passive helicopter detector [DE85-015160] p 123 N86-12595

**RECOVERABILITY**

Parachute recovery systems design manual, chapters 1 through 4 offprint [AD-A157839] p 87 N86-12210

**RECTANGULAR WINGS**

An analysis of separated flow of an ideal fluid past a finite-aspect-ratio mechanized wing p 80 A86-13395

**REDUNDANCY**

Sensor failure detection for jet engines using analytical redundancy p 106 A86-14226

**REFLECTANCE**

A durable airfield marking system [AD-A157953] p 113 N86-13339

**REFRACTIVITY**

Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition [AD-A157943] p 89 N86-13302

**REFRACTORY COATINGS**

Characterization of the thermal conductivity for fibrous refractory composite insulations p 116 A86-15220

**REINFORCED PLASTICS**

Metals anad plastics - State of the art and perspectives [MBB-Z-49-85-OE] p 116 A86-14474

**REPORTS**

The 1983 NASA/ASEE Summer Faculty Fellowship Research Program research reports [NASA-CR-171904] p 130 N86-14078

**RESCUE OPERATIONS**

Telemetry from experimental rescue- and recovery systems p 95 A86-13219

The C-17: We need it yesterday [AD-A157147] p 99 N86-12219

Tradeoff analysis of technology needs for public service helicopters [NASA-CR-3927] p 100 N86-13317

**RESEARCH AIRCRAFT**

X-29 flight testing p 95 A86-13213

**RESEARCH AND DEVELOPMENT**

Derivative engines versus new engines - What determines the choice? [ASME PAPER 85-GT-190] p 104 A86-13051

The RAJPO GPS range equipment family --- navigation modules for various military applications p 92 A86-13216

Airborne telemetry - The advanced range instrumentation aircraft p 92 A86-13225

The in-flight simulation program at the NAE Flight Research Laboratory p 96 A86-14356

Development of modern turboprop engines p 106 A86-14358

Engine simulator techniques for scaled test cell studies [AIAA PAPER 85-1282] p 112 A86-14480

The laminar airliner - Prospects and problems --- review of boundary layer control research p 98 A86-14822

4 x S = S(ATF) --- Advanced Tactical Fighter development p 98 A86-15596

Army VTOL research and development - The first century p 75 A86-16096

The 1983 NASA/ASEE Summer Faculty Fellowship Research Program research reports [NASA-CR-171904] p 130 N86-14078

**RESIN MATRIX COMPOSITES**

Polymer, metal and ceramic matrix composites for advanced aircraft engine applications [NASA-TM-87132] p 117 N86-13407

**RESINS**

Conformal coating for surface mount assembly p 115 A86-13118

**RESONANCE TESTING**

The performance of composite structures p 121 A86-14680

**RESONANT VIBRATION**

Transmission acoustic vibration testing [AD-A159022] p 101 N86-13326

**REVERSED FLOW**

The use of reverse flow to calculate transonic flow past bodies p 81 A86-13412

Separated flow past a sharp edge according to a reverse-jet scheme p 120 A86-13430

**REVISIONS**

F-4 functional modernization [ASME PAPER 85-GT-69] p 94 A86-13052

Douglas plans continuing upgrades to maintain MD-80 competitiveness p 98 A86-15999

**REYNOLDS NUMBER**

Introduction to cryogenic wind tunnels [NASA-CR-177986] p 113 N86-12238

**RIGID ROTORS**

Rotor dynamics equations in complex form p 122 A86-16040

Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight p 98 A86-16123

The effect of higher harmonic control (HHC) on a four-bladed hingeless model rotor p 99 A86-16124

**RIVETING**

The use of automated riveting systems in aircraft construction p 95 A86-13127

**ROBOTICS**

Boeing Military Airplane Company's robotic ultrasonic inspection system p 118 A86-13180

Physical distribution system for aircraft external fuel tanks-survey [AD-A158275] p 101 N86-13324

**ROBOTS**

Boeing Military Airplane Company's robotic ultrasonic inspection system p 118 A86-13180

**ROBUSTNESS (MATHEMATICS)**

Multi-model approaches to robust control system design p 127 A86-14830

**RODS**

Fracture toughness characterization of light alloys for aeronautical use p 114 A86-12761

**ROLL**

Using roll-angle measurements to track aircraft maneuvers p 92 A86-12677

**ROLLING CONTACT LOADS**

Equations of rolling for a wheel with an elastic tire p 96 A86-13369

**ROTARY WING AIRCRAFT**

Aeromechanical stability analysis of a hybrid heavy lift multirotor vehicle in hover p 110 A86-14530

Assessment of aerodynamic and dynamic models in a comprehensive analysis
[NASA-TM-86835] p 75 N86-13296

Tradeoff analysis of technology needs for public service helicopters
[NASA-CR-3927] p 100 N86-13317

**ROTARY WINGS**

Analytical method for considering the elasticity of the blades in the aerodynamic calculation of a helicopter propeller p 96 A86-13421

Computation of rotor blade flows using the Euler equations
[AIAA PAPER 85-5010] p 84 A86-14455

Solution of transonic flow past rotor blades using the conservative full potential equation
[AIAA PAPER 85-5012] p 84 A86-14456

Velocity measurements in the near field of a rotor blade in hover
[AIAA PAPER 85-5013] p 84 A86-14457

Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 2: Final definition of Helix and Felix
[AD-A158622] p 101 N86-13322

**ROTOR AERODYNAMICS**

Computation of rotor blade flows using the Euler equations
[AIAA PAPER 85-5010] p 84 A86-14455

Solution of transonic flow past rotor blades using the conservative full potential equation
[AIAA PAPER 85-5012] p 84 A86-14456

Velocity measurements in the near field of a rotor blade in hover
[AIAA PAPER 85-5013] p 84 A86-14457

Studies of rotor-airframe interactions in forward flight
[AIAA PAPER 85-5015] p 97 A86-14458

Multistage compressor stator/rotor interaction
p 85 A86-14556

Calculation of unsteady fan rotor response caused by downstream flow distortions p 85 A86-14558

**ROTOR BLADES**

Simulation of the effects of shock wave passing on a turbine rotor blade
[ASME PAPER 85-GT-112] p 77 A86-13067

Pressure fluctuations on rotor blades generated by blade-vortex interaction p 86 A86-16122

Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight
p 98 A86-16123

The effect of higher harmonic control (HHC) on a four-bladed hingeless model rotor p 99 A86-16124

Experience with a new approach to rotor aeroelasticity
p 99 A86-16125

**ROTOR BLADES (TURBOMACHINERY)**

Unsteady potential flow for oscillating airfoils
p 83 A86-14359

Ice shapes and the resulting drag increase for a NACA 0012 airfoil
[AIAA PAPER 84-0109] p 90 A86-14427

Multistage compressor stator/rotor interaction
p 85 A86-14556

**ROTOR BODY INTERACTIONS**

Aeromechanical stability analysis of a hybrid heavy lift multirotor vehicle in hover p 110 A86-14530

**ROTOR LIFT**

Preliminary report on in-flight measurement of rotor hub drag and lift using the RSRA
[NASA-TM-86764] p 100 N86-13319

**ROTOR SYSTEMS RESEARCH AIRCRAFT**

Preliminary report on in-flight measurement of rotor hub drag and lift using the RSRA
[NASA-TM-86764] p 100 N86-13319

**ROTORCRAFT AIRCRAFT**

Longitudinal stability of a hovering, tethered rotorcraft
p 109 A86-14235

Tradeoff analysis of technology needs for public service helicopters
[NASA-CR-3927] p 100 N86-13317

**ROTORS**

Preliminary report on in-flight measurement of rotor hub drag and lift using the RSRA
[NASA-TM-86764] p 100 N86-13319

**RUN TIME (COMPUTERS)**

A new fast solver procedure applied to the BGK computer program for transonic flow past an aerofoil
p 83 A86-14360

**RUNWAY CONDITIONS**

Aircraft field repair p 115 A86-13172

Waves due to a steadily moving source on a floating ice plate — used as aircraft runway p 124 A86-13535

Damaged runway options explored p 75 A86-15600

**RUNWAYS**

CBR (California Bearing Ratio) design of flexible airfield pavements with case study
[AD-A158101] p 113 N86-12242

Abrasion behavior of aluminum and composite skin coupons, stiffened skins and stiffened panels representative of transport airplane structures
[NASA-TP-2520] p 100 N86-13316

A durable airfield marking system
[AD-A157953] p 113 N86-13339

**S**

**S-N DIAGRAMS**

A model for the life variance of a structural element under irregular loading p 119 A86-13388

**SAFETY DEVICES**

Advanced emergency openings for commercial aircraft
[NASA-TM-87580] p 91 N86-13305

**SAFETY MANAGEMENT**

NASA flight operations review
[NASA-CR-176393] p 91 N86-13306

**SAILS**

China report: Science and technology
[JPRS-CST-85-029] p 122 N86-12446

Wingtip sails tested on Y-5 aircraft p 99 N86-12450

**SANDWICH STRUCTURES**

Dynamic response of a laminated plate with friction damping
[ASME PAPER 85-DET-16] p 122 A86-16032

**SATELLITE OBSERVATION**

Introduction to operational ASDAR system
p 125 N86-12915

**SATELLITE TRANSMISSION**

Introduction to operational ASDAR system
p 125 N86-12915

**SCALE MODELS**

Engine simulator techniques for scaled test cell studies
[AIAA PAPER 85-1282] p 112 A86-14460

Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[NASA-TM-87116] p 129 N86-14006

**SCANNING**

Effects of digital altimetry on pilot workload
[NASA-TM-86424] p 126 N86-13692

**SCAVENGING**

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 1
[NASA-CR-174923-VOL-1] p 106 N86-13328

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 2
[NASA-CR-174923-VOL-2] p 106 N86-13329

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 3
[NASA-CR-174923-VOL-3] p 106 N86-13330

**SEA ICE**

Waves due to a steadily moving source on a floating ice plate — used as aircraft runway p 124 A86-13535

**SEA STATES**

An investigation into the vertical axis control power requirements for landing VTOL type aircraft onboard nonaviation ships in various sea states
[NASA-CR-176355] p 88 N86-13294

**SEALERS**

A low temperature curing, quick repair, fuel resistant aircraft sealant p 115 A86-13082

**SEALS (STOPPERS)**

Counterrotating intershaft seals for advanced engines
p 121 A86-14554

Ribbon-burner simulation of T-700 turbine shroud for ceramic-lined seals research p 106 A86-15225

Experimental study of ceramic-coated tip seals for turbojet engines p 121 A86-15227

**SEARCHING**

Tradeoff analysis of technology needs for public service helicopters
[NASA-CR-3927] p 100 N86-13317

**SEATS**

The development of dynamic performance standards for general aviation aircraft seats
[SAE PAPER 850853] p 97 A86-14449

**SECONDARY FLOW**

Secondary flows and losses downstream of a turbine cascade
[ASME PAPER 85-GT-64] p 77 A86-13062

Double-branched vortex generator
[NASA-TM-88201] p 89 N86-13299

**SECONDARY RADAR**

Using roll-angle measurements to track aircraft maneuvers p 92 A86-12677

**SEISMIC WAVES**

New passive helicopter detector
[DE85-015160] p 123 N86-12595

**SELF ORGANIZING SYSTEMS**

An application of adaptive learning to malfunction recovery
[AD-A158129] p 110 N86-12236

**SELF REPAIRING DEVICES**

A self-repairing aircraft? — new control methods for fighter stabilization p 110 A86-14249

**SEMICONDUCTOR DEVICES**

China report: Science and technology
[JPRS-CST-85-036] p 122 N86-12399

**SENSORS**

Fiber optics for propulsion control systems
[ASME PAPER 84-GT-97] p 105 A86-13064

**SEPARATED FLOW**

A study of the normal of a delta-wing aircraft at large angles of attack during unsteady motion
p 79 A86-13379

An analysis of separated flow of an ideal fluid past a finite-aspect-ratio mechanized wing p 80 A86-13395

Formation of asymmetric separated flow past slender bodies of revolution at large angles of attack
p 82 A86-13429

Separated flow past a sharp edge according to a reverse-jet scheme p 120 A86-13430

Separated flow unsteady aerodynamic theory
p 86 A86-14529

Evaluation of low Reynolds number turbulence models for attached and separated flows p 121 A86-14539

**SERVICE LIFE**

Consideration of the multiplicity of critical spots in a structure in estimating the durability and the service life
p 119 A86-13387

Influence of unsteady flow effects on the length of operation of a hypersonic shock tunnel
p 112 A86-13428

**SERVOMECHANISMS**

Digital servocontroller system. Volume 4. Results and conclusions
[AD-A159066] p 111 N86-13335

**SHARP LEADING EDGES**

Separated flow past a sharp edge according to a reverse-jet scheme p 120 A86-13430

**SHEAR FLOW**

Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[AD-A157750] p 89 N86-13301

**SHIPS**

An investigation into the vertical axis control power requirements for landing VTOL type aircraft onboard nonaviation ships in various sea states
[NASA-CR-176355] p 88 N86-13294

**SHOCK TUNNELS**

Influence of unsteady flow effects on the length of operation of a hypersonic shock tunnel
p 112 A86-13428

**SHOCK WAVE INTERACTION**

A study of flow near a shock wave intersection line
p 78 A86-13353

**SHOCK WAVE PROPAGATION**

Simulation of the effects of shock wave passing on a turbine rotor blade
[ASME PAPER 85-GT-112] p 77 A86-13067

**SHOCK WAVES**

Measurement of the heterogeneous recombination probability of oxygen atoms in the course of supersonic dissociated gas flow interaction with solid body surfaces
p 85 A86-14743

**SHORT TAKEOFF AIRCRAFT**

Strain measurement of the USB-flap structures of NAL STOL aircraft p 95 A86-13315

Aero/propulsion technology for STOL and maneuver
[AIAA PAPER 85-4013] p 97 A86-14436

The C-17: We need it yesterday
[AD-A157147] p 99 N86-12219

**SHROUDED TURBINES**

Ribbon-burner simulation of T-700 turbine shroud for ceramic-lined seals research p 106 A86-15225

**SIGNAL DETECTION**

The evaluation of failure detection and isolation algorithms for restructurable control
[NASA-CR-177983] p 93 N86-13310

**SIGNAL PROCESSING**

An over the horizon command/data link system
p 92 A86-13224

The use of translators with GPS — for signal conversion p 93 A86-13230

**SIMULATION**

Wall-interference assessment in three-dimensional slotted-wall wind tunnels
[NASA-CR-176320] p 113 N86-12240

An investigation into the vertical axis control power requirements for landing VTOL type aircraft onboard nonaviation ships in various sea states
[NASA-CR-176355] p 88 N86-13294

A preliminary evaluation of the generalized likelihood ratio for detecting and identifying control element failures in a transport aircraft
[NASA-TM-87620] p 111 N86-13332

Pitch rate versus G command as the longitudinal flight control system design strategy for a statically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334
The mission oriented terminal area simulation facility
[NASA-TM-87621] p 128 N86-13944

**SITES**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159116] p 94 N86-13314

**SKID LANDINGS**
Abrasion behavior of aluminum and composite skin coupons, stiffened skins and stiffened panels representative of transport airplane structures
[NASA-TP-2520] p 100 N86-13316

**SKIN (STRUCTURAL MEMBERS)**
Measurement of preferential moisture ingress in composite wing/spar joints p 116 A86-16100
Abrasion behavior of aluminum and composite skin coupons, stiffened skins and stiffened panels representative of transport airplane structures
[NASA-TP-2520] p 100 N86-13316

**SLENDER BODIES**
Formation of asymmetric separated flow past slender bodies of revolution at large angles of attack
p 82 A86-13429

**SLENDER WINGS**
Symmetric transonic flow past wings of large aspect ratios p 78 A86-13252
Certain criteria and formulas for the analysis of flexural-torsional flutter p 109 A86-13394

**SLIPSTREAMS**
Experimental study of the combustion of gas-air mixtures in a channel and the diffusion combustion in a slipstream at high velocities
[AD-A157495] p 116 N86-12271

**SLOPES**
An analytical comparison of three visual approach slope indicators: VASIS, T-VASIS and PAPI
[ARL/SYS-R-33] p 93 N86-13309

**SLOTTED WIND TUNNELS**
User's guide to STIPPAN: A panel method program for slotted tunnel interference prediction
[NASA-CR-178003] p 113 N86-12237
Wall-interference assessment in three-dimensional slotted-wall wind tunnels
[NASA-CR-176320] p 113 N86-12240

**SMALL PERTURBATION FLOW**
Propagation of small perturbations during the interaction of nonviscous jets p 80 A86-13390

**SOFTWARE TOOLS**
AIRID - An application of the KAS/Prospector expert system builder to airplane identification
p 128 A86-15283

**SOLID PROPELLANT COMBUSTION**
Solid fuel ramjet simulator results - Experiment and analysis in cold flow --- solid fuel ramjet
p 106 A86-14582
Combustion related to solid-fuel ramjets
p 116 A86-14586

**SOLID PROPELLANTS**
Crushing strength of aluminum oxide agglomerates
[AD-A158051] p 124 N86-13756

**SOLITARY WAVES**
Wind shear induced by solitary waves in the lower atmosphere
[IAF PAPER 85-410] p 125 A86-15886

**SOUND TRANSMISSION**
Transmission acoustic vibration testing
[AD-A159022] p 101 N86-13326

**SOUND WAVES**
New passive helicopter detector
[DE85-015160] p 123 N86-12595
Transmission acoustic vibration testing
[AD-A159022] p 101 N86-13326

**SOVIET SPACECRAFT**
Studies in the history and theory of the development of science and technology in the fields of aviation, rocketry, and space. Number 3 — Russian book
p 131 A86-13482

**SPACE COMMERCIALIZATION**
Emerging aerospace technologies
[NASA-TM-86837] p 131 N86-14213

**SPACE SHUTTLES**
Computer graphics applications to crew displays
p 128 N86-14104

**SPACE STATIONS**
Emerging aerospace technologies
[NASA-TM-86837] p 131 N86-14213

**SPACECRAFT DESIGN**
Studies in the history and theory of the development of science and technology in the fields of aviation, rocketry, and space. Number 3 — Russian book
p 131 A86-13482

**SPACECRAFT STRUCTURES**
Polymer, metal and ceramic matrix composites for advanced aircraft engine applications
[NASA-TM-87132] p 117 N86-13407

**SPECIFICATIONS**
National airspace system, system requirements specification
[AD-A157944] p 94 N86-13312

**SPECTRA**
Study of the influence of an oscillating spoiler on the surrounding aerodynamic field
[IMFL-3119] p 90 N86-13303

**SPECTROSCOPY**
Method to detect ethylene glycol in gaseous mixtures
[AD-A158109] p 116 N86-12272

**SPEED CONTROL**
Two-hundred to 300 KVA conditioned power system - development, phase 1
[AD-A158820] p 125 N86-13632

**SPHERICAL COORDINATES**
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174292] p 88 N86-13293

**SPIN DYNAMICS**
Method for calculating the equilibrium spin of an aircraft p 109 A86-13435
Free-falling autorotating plate - A coupled fluid and flight mechanics problem p 110 A86-14533

**SPOILERS**
A study of the flow around a wing equipped with a spoiler p 83 A86-14186
Study of the influence of an oscillating spoiler on the surrounding aerodynamic field
[IMFL-3119] p 90 N86-13303

**SPRAYERS**
Heat transfer and pressure drop performance of a finned-tube heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel
[NASA-TM-87151] p 123 N86-13677

**STANDARDIZATION**
Navy should join the Air Force and Army program to develop an advanced integrated avionics system
[PB85-222503] p 104 N86-12224

**STANDARDS**
The development of dynamic performance standards for general aviation aircraft seats
[SAE PAPER 850853] p 97 A86-14449

**STATIC PRESSURE**
Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation
[AD-A157108] p 107 N86-12229

**STATIC STABILITY**
Allowance for initial conditions in static and dynamic calculations of structures by the finite element method
p 119 A86-13419

**STATISTICAL ANALYSIS**
Statistical formulation of the objectives of the aerodynamic experiment p 80 A86-13381
Statistical sampling of aircraft operations at non-towered airports
[AD-A157085] p 128 N86-13051

**STATISTICAL MECHANICS**
NASA LeRC/Akron University Graduate Cooperative Fellowship Program and Graduate Student Researchers Program
[NASA-CR-174826] p 130 N86-13219

**STATOR BLADES**
Multistage compressor stator/rotor interaction
p 85 A86-14556

**STEADY FLOW**
Calculation of steady flow about propellers using a surface panel method p 85 A86-14559

**STEADY STATE**
Method for calculating the equilibrium spin of an aircraft p 109 A86-13435
Calculation of equilibrium turn p 109 A86-13436

**STEELS**
Methods of constructing R-curves and application of these curves for evaluation of materials (Review)
p 117 A86-13011
A durable airfield marking system
[AD-A157953] p 113 N86-13339

**STIFFNESS**
Nondestructive test methods for composite structures
p 118 A86-13147
Using isoperimetric inequalities for the two-sided estimation of the torsional stiffness of a prismatic bar
p 119 A86-13410
Design of a minimum-weight gliding wing
p 96 A86-13437

**STORMS (METEOROLOGY)**
Evaluation of meteorological airborne Doppler radar. I Dual-Doppler analyses of air motions. II - Triple-Doppler analyses of air motions p 103 A86-14223

**STRAIN GAGE BALANCES**
Improved drag element for wind tunnel sting balances
p 112 A86-14532
Algorithms for the reduction of wind-tunnel data derived from strain gauge force balances
[ARL/AERO-R-164] p 113 N86-13337

**STRAIN MEASUREMENT**
Strain measurement of the USB-flap structures of NAL STOL aircraft p 95 A86-13315
New methods of measuring strain and temperature in a turbine engine p 118 A86-13336
Application of computerized data acquisition and data processing to the surface contouring of large structures
p 118 A86-13342

**STRAPS**
Passive arm retention curtain
[AD-D011676] p 91 N86-13307

**STREAMLINING**
The status of two-dimensional testing at high transonic speeds in the University of Southampton transonic self-streamlining wind tunnel
[NASA-CR-3919] p 86 N86-12203

**STRESS ANALYSIS**
Consideration of the multiplicity of critical spots in a structure in estimating the durability and the service life
p 119 A86-13367

**STRESS CONCENTRATION**
Cutouts in load-bearing structures --- Russian book
p 120 A86-13463

**STRESS INTENSITY FACTORS**
Methods of constructing R-curves and application of these curves for evaluation of materials (Review)
p 117 A86-13011

**STRESS MEASUREMENT**
New methods of measuring strain and temperature in a turbine engine p 118 A86-13336

**STRUCTURAL ANALYSIS**
A model for the life variance of a structural element under irregular loading p 119 A86-13388
Computation of aeronautical structures — Romanian book p 120 A86-14157
NASA LeRC/Akron University Graduate Cooperative Fellowship Program and Graduate Student Researchers Program
[NASA-CR-174826] p 130 N86-13219

**STRUCTURAL DESIGN**
Panel design for optimum strength and stability with allowance for the nonuniformity of heating
p 119 A86-13357

**STRUCTURAL DESIGN CRITERIA**
Wing structure design for maximum aileron efficiency
p 95 A86-13368
Optimization of structural load-bearing designs using anisotropic models according to aeroelasticity conditions
p 96 A86-13438
A survey of aeronautical structural research in Australia
[AD-A157211] p 76 N86-12199
NASA LeRC/Akron University Graduate Cooperative Fellowship Program and Graduate Student Researchers Program
[NASA-CR-174826] p 130 N86-13219

**STRUCTURAL ENGINEERING**
A survey of aeronautical structural research in Australia
[AD-A157211] p 76 N86-12199
CBR (California Bearing Ratio) design of flexible airfield pavements with case study
[AD-A158101] p 113 N86-12242

**STRUCTURAL INFLUENCE COEFFICIENTS**
An algorithm for calculating the coupling between matrices of elastic influence coefficients for two systems of computational points p 119 A86-13362

**STRUCTURAL MEMBERS**
Cutouts in load-bearing structures — Russian book
p 120 A86-13463

**STRUCTURAL RELIABILITY**
Consideration of the multiplicity of critical spots in a structure in estimating the durability and the service life
p 119 A86-13367
Aircraft crashing. Analysis and identification methods. Presentation of a solution method
[IMFL-4116] p 91 N86-13308

**STRUCTURAL STABILITY**
Experimental/analytic comparisons considering composite panels with a cutout p 118 A86-13338
Panel design for optimum strength and stability with allowance for the nonuniformity of heating
p 119 A86-13357
Cutouts in load-bearing structures — Russian book
p 120 A86-13463
Dynamic strength problems in aerospace equipment
p 120 A86-13690

**STRUCTURAL VIBRATION**
Prediction and measurement of damping of vibrations of structures by adhesives p 116 A86-13171

Dynamic strength problems in aerospace equipment p 120 A86-13690

Vibration analysis of rotating turbomachinery blades by an improved finite difference method p 106 A86-14338

**SUBSONIC FLOW**

Using suction for increasing Mach numbers in a perforated test section with a subsonic nozzle — of wind tunnel p 112 A86-13405

Separated flow unsteady aerodynamic theory p 85 A86-14529

A numerical method for calculating internal subsonic swirling flows of an ideal gas p 85 A86-14679

User's guide to STIPPAN: A panel method program for slotted tunnel interference prediction [NASA-CR-178003] p 113 N86-12237

A direct-inverse method for transonic and separated flows about airfoils [NASA-CR-176403] p 89 N86-13300

**SUBSONIC WIND TUNNELS**

Subsonic thermal wind tunnel with an Eiffel chamber p 112 A86-13443

**SUCTION**

Using suction for increasing Mach numbers in a perforated test section with a subsonic nozzle — of wind tunnel p 112 A86-13405

**SUPERCHARGERS**

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 1 [NASA-CR-174923-VOL-1] p 108 N86-13328

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 2 [NASA-CR-174923-VOL-2] p 108 N86-13329

Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 3 [NASA-CR-174923-VOL-3] p 108 N86-13330

**SUPERCRITICAL AIRFOILS**

Effect of surface waviness on a supercritical laminar-flow-control airfoil [NASA-TM-85705] p 86 N86-12206

**SUPERCRITICAL WINGS**

A method for numerical analysis of the aerodynamic characteristics of an aeroplane wing in the subcritical range of the flying velocity p 83 A86-13933

**SUPERSONIC AIRCRAFT**

4 x S = S(ATF) — Advanced Tactical Fighter development p 98 A86-15598

Introduction to cryogenic wind tunnels [NASA-CR-177966] p 113 N86-12238

Japanese report on China's F-8 fighter p 111 N86-12405

**SUPERSONIC DIFFUSERS**

Diffuser parameter optimization for low Reynolds numbers using experimental data p 111 A86-13400

**SUPERSONIC FLOW**

A marching explicit-implicit procedure for calculating supersonic flow past bodies p 78 A86-13296

A study of flow near a shock wave intersection line p 78 A86-13353

Selecting the principal parameters of a wedge-profiled wing p 78 A86-13358

Calculation of supersonic inviscid flow past a plane air intake element with an isolated head wave p 79 A86-13364

Profiling of supersonic ducts with specified nonisentropic parameters at the exit p 79 A86-13375

A combined method for the analysis of the aerodynamic forces acting on an oscillating flight vehicle in supersonic flow p 79 A86-13380

Calculation of supersonic flow past a three-dimensional configuration using integral relationships p 81 A86-13423

Theory of self-similar regimes of supersonic flow in an axisymmetric channel with a sudden expansion p 82 A86-13427

Supersonic gas flow past a V-shaped wing p 82 A86-13440

Measurement of the heterogeneous recombination probability of oxygen atoms in the course of supersonic dissociated gas flow interaction with solid body surfaces p 85 A86-14743

**SUPERSONIC INLETS**

A linear multivariable dynamical model of a supersonic inlet-engine combination p 85 A86-14560

**SUPERSONIC JET FLOW**

Propagation of small perturbations during the interaction of nonviscous jets p 80 A86-13390

**SUPERSONIC NOZZLES**

A method for measuring the direction and the Mach number of a three-dimensional supersonic nozzle p 80 A86-13392

Compact gas ejector of a high degree of compression with spiral arrangement of the nozzles p 82 A86-13433

**SUPERSONIC SPEEDS**

Characteristics of the lifting properties of aircraft with sweptforward wings at supersonic velocities p 96 A86-13371

Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A [NASA-TM-87116] p 129 N86-14006

**SUPERSONIC TURBINES**

Numerical analysis of fully three-dimensional periodic flows through a turbine stage [ASME PAPER 85-GT-57] p 75 A86-13060

**SURFACE DISTORTION**

Certain problems of fluid flow near the core of a spiral discontinuity p 120 A86-13424

**SURFACE PROPERTIES**

A study of heat transfer on wedges with a swept leading edge and a sharply bent generatrix p 81 A86-13399

**SWEEP ANGLE**

A study of heat transfer on wedges with a swept leading edge and a sharply bent generatrix p 81 A86-13399

**SWEPT FORWARD WINGS**

Characteristics of the lifting properties of aircraft with sweptforward wings at supersonic velocities p 96 A86-13371

Flutter and divergence aeroelastic characteristics for composite forward swept cantilevered wing p 97 A86-14536

**SWEPT WINGS**

Construction of equivalent profiles and approximate calculation of transonic flow past the root section of a swept wing p 80 A86-13396

The efficient simulation of separated three-dimensional viscous flows using the boundary-layer equations [AIAA PAPER 85-4064] p 84 A86-14452

Doublet strip method for oscillating swept tapered wings in incompressible flow p 85 A86-14537

Measurements in the turbulent boundary layer on an 'infinite' swept wing p 86 A86-16102

**SWIRLING**

Multispark flow visualization of lateral jet injection into a swirling cross flow p 85 A86-14561

A numerical method for calculating internal subsonic swirling flows of an ideal gas p 85 A86-14679

**SYSTEM EFFECTIVENESS**

National airspace system, system requirements specification [AD-A157944] p 94 N86-13312

**SYSTEM FAILURES**

The evaluation of failure detection and isolation algorithms for restructurable control [NASA-CR-177983] p 93 N86-13310

**SYSTEMS ENGINEERING**

Parachute recovery systems design manual, chapters 1 through 4 offprint [AD-A157839] p 87 N86-12210

**SYSTEMS INTEGRATION**

Automation and integration on AFTI/F-16 [AIAA PAPER 85-3089] p 103 A86-14433

**SYSTEMS SIMULATION**

Solid fuel ramjet simulator results - Experiment and analysis in cold flow — solid fuel ramjet p 106 A86-14562

**SYSTEMS STABILITY**

Application of the state-space method to analyze the stability of digital systems p 127 A86-13418

A method to stabilize linear systems using eigenvalue gradient information [NASA-TP-2479] p 128 N86-13946

## T

**TAIL ASSEMBLIES**

Simulation of the enhanced traffic alert and collision avoidance system (TCAS 2) [NASA-CR-176328] p 93 N86-12216

Effect of measured material properties on the finite element analysis of an OH-58 composite tail boom [NASA-TM-86430] p 116 N86-12259

**TAILLESS AIRCRAFT**

Aircraft of the future [NASA-TM-77952] p 100 N86-13318

**TAKEOFF**

Aircraft field repair p 115 A86-13172

Damaged runway options explored p 75 A86-15600

**TAKEOFF RUNS**

A brief history of the first U.S. JATO flight tests of August 1941 [IAF PAPER 85-453] p 131 A86-15913

**TANKS (CONTAINERS)**

Electrically conductive structural adhesive p 115 A86-13170

**TAPERING**

Doublet strip method for oscillating swept tapered wings in incompressible flow p 85 A86-14537

**TARGET ACQUISITION**

Missile guidance based on Kalman filter estimation of target maneuver p 102 A86-12883

LANTIRN - Turning night into day p 103 A86-15599

**TASKS**

An analysis of the application of AI to the development of intelligent aids for flight crew tasks [NASA-CR-3944] p 90 N86-12212

**TECHNOLOGICAL FORECASTING**

Aircraft of the future [NASA-TM-77952] p 100 N86-13318

**TECHNOLOGY ASSESSMENT**

National SAMPE Symposium and Exhibition, 30th, Anaheim, CA, March 19-21, 1985, Proceedings p 115 A86-13076

Studies in the history and theory of the development of science and technology in the fields of aviation, rocketry, and space. Number 3 — Russian book p 131 A86-13462

Powered-lift technology on the threshold p 96 A86-14245

Metals aned plastics - State of the art and perspectives [MBB-Z-49-85-OE] p 116 A86-14474

EC-135 fiber optic technology review p 75 A86-15341

A brief history of the first U.S. JATO flight tests of August 1941 [IAF PAPER 85-453] p 131 A86-15913

Aeronautical technology 2000: A projection of advanced vehicle concepts [NASA-CR-176322] p 130 N86-13235

**TECHNOLOGY TRANSFER**

Emerging aerospace technologies [NASA-TM-86837] p 131 N86-14213

**TECHNOLOGY UTILIZATION**

Technological support for aircraft production — Russian book p 75 A86-13446

Productivity improvements through the use of CAD/CAM p 121 A86-14538

Application of pulsed reflection holography to material testing p 122 A86-16090

**TELEMETRY**

X-29 flight testing p 95 A86-13213

Grumman's automated test systems p 111 A86-13214

Telemetry from experimental rescue- and recovery systems p 95 A86-13219

Airborne telemetry - The advanced range instrumentation aircraft p 92 A86-13225

**TEMPERATURE MEASUREMENT**

New methods of measuring strain and temperature in a turbine engine p 118 A86-13336

**TEMPERATURE SENSORS**

Improved temperature detection system for use on film cooled turbine airfoils [AD-D011762] p 107 N86-12228

**TENSILE STRENGTH**

A durable airfield marking system [AD-A157953] p 113 N86-13339

**TERRAIN FOLLOWING AIRCRAFT**

LANTIRN - Turning night into day p 103 A86-15599

**TEST CHAMBERS**

Subsonic thermal wind tunnel with an Eiffel chamber p 112 A86-13443

Radio frequency chamber improves LAMPS Mk III testing p 112 A86-15526

**TEST EQUIPMENT**

A programmable data acquisition system with integrated test and calibration facilities — in-flight aircraft testing p 102 A86-13215

**TEST RANGES**

The RAJPO GPS range equipment family — navigation modules for various military applications p 92 A86-13216

**TEST STANDS**

Engine simulator techniques for scaled test cell studies [AIAA PAPER 85-1282] p 112 A86-14480

**TETHERING**

Longitudinal stability of a hovering, tethered rotorcraft p 109 A86-14235

**THEORETICAL PHYSICS**

A method for arranging nodes along the lines of a computational grid during the numerical solution of problems in mathematical physics p 127 A86-13409

**THERMAL ANALYSIS**

Constant temperature heaters for the repair of composite structures p 115 A86-13174

**THERMAL CONDUCTIVITY**

Characterization of the thermal conductivity for fibrous refractory composite insulations p 116 A86-15220

**THERMAL INSULATION**

The drag of a thermally insulated plate in a stream of a compressible gas under mixed flow conditions p 120 A86-13671

Characterization of the thermal conductivity for fibrous refractory composite insulations p 118 A86-15220

**THERMOCOUPLES**
High-temperature thermocouple and heat flux gauge using a unique thin film-hardware hot junction [ASME PAPER 85-GT-18] p 117 A86-13059

**THERMOGRAPHY**
Nondestructive test methods for composite structures p 118 A86-13147
Test of jet engine turbine blades by thermography p 106 A86-15410

**THIN AIRFOILS**
Seperated flow unsteady aerodynamic theory p 85 A86-14529

**THIN FILMS**
High-temperature thermocouple and heat flux gauge using a unique thin film-hardware hot junction [ASME PAPER 85-GT-18] p 117 A86-13059

**THIN WINGS**
The effect of the incalculable flow regime of air scoops on flow past a wing p 78 A86-13354
Effect of cantilevers on the lift characteristics of a thin swept wing and vortex-wake stability p 81 A86-13422

**THREE DIMENSIONAL BOUNDARY LAYER**
The efficient simulation of seperated three-dimensional viscous flows using the boundary-layer equations [AIAA PAPER 85-4064] p 84 A86-14452

**THREE DIMENSIONAL FLOW**
Numerical analysis of fully three-dimensional periodic flows through a turbine stage [ASME PAPER 85-GT-57] p 76 A86-13060
Performance evaluation of linear turbine cascades using three-dimensional viscous flow calculations [ASME PAPER 85-G-65] p 77 A86-13063
Effects of tip endwall contouring on the three-dimensional flow field in an annular turbine nozzle guide vane. I - Experimental investigation [ASME PAPER 85-GT-71] p 77 A86-13065
Calculation of flows in two- and three-dimensional nozzles by an approximate factorization method p 77 A86-13294
A study of flow near a shock wave intersection line p 78 A86-13353
A method for measuring the direction and the Mach number of a three-dimensional supersonic nozzle p 80 A86-13392
Computation of rotor blade flows using the Euler equations [AIAA PAPER 85-5010] p 84 A86-14455
Numerical solutions of Navier-Stokes equations for a Butler wing [NASA-CR-174202] p 88 N86-13293

**THREE DIMENSIONAL MOTION**
Calculation of equilibrium turn p 109 A86-13436

**THRUST**
Thrust and drag: Its prediction and verification — Book p 96 A86-14161

**THRUST REVERSAL**
Aero/propulsion technology for STOL and maneuver [AIAA PAPER 85-4013] p 97 A86-14436

**THRUST VECTOR CONTROL**
Aero/propulsion technology for STOL and maneuver [AIAA PAPER 85-4013] p 97 A86-14436
Post stall maneuvers and thrust vectoring performance analysis [AD-A158100] p 110 N86-12235

**THRUST-WEIGHT RATIO**
Polymer, metal and ceramic matrix composites for advanced aircraft engine applications [NASA-TM-87132] p 117 N86-13407

**THUNDERSTORMS**
Microbursts - A hazard for aircraft — small, intense thunderstorm outflow p 124 A86-14816

**TILES**
A durable airfield marking system [AD-A157953] p 113 N86-13339

**TILT ROTOR AIRCRAFT**
Stability and control of VTOL capable airships in hovering flight p 109 A86-14236

**TILT ROTOR RESEARCH AIRCRAFT PROGRAM**
The V-22 - Preparing for full-scale development p 98 A86-16095

**TIME DEPENDENCE**
Cumulative-damage modeling of fatigue crack growth in turbine engine materials p 105 A86-13599
Changes of flying skills during non-flight periods p 125 A86-13944

**TIME MARCHING**
A marching explicit-implicit procedure for calculating supersonic flow past bodies p 78 A86-13296

**TIME OPTIMAL CONTROL**
Selection of an optimal cost index for airline hub operation p 130 A86-14239

**TIP SPEED**
Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A [NASA-TM-87116] p 129 N86-14006

**TITANIUM ALLOYS**
Metals anad plastics - State of the art and perspectives [MBB-Z-49-85-OE] p 116 A86-14474

**TOLERANCES (PHYSIOLOGY)**
G protection by an extreme crouch position [AD-A157081] p 91 N86-12213

**TOLLMEIN-SCHLICHTING WAVES**
A numerical analysis of the characteristics of a Tollmien-Schlichting wave packet in a boundary layer on a flat plate p 79 A86-13374

**TOPOGRAPHY**
Infrared flight simulation using computer generated imagery p 103 A86-15378

**TORSIONAL STRESS**
Using isoperimetric inequalities for the two-sided estimation of the torsional stiffness of a prismatic bar p 119 A86-13410

**TORSIONAL VIBRATION**
A property of the elastic vibrations of nearly symmetric systems p 119 A86-13387
Certain criteria and formulas for the analysis of flexural-torsional flutter p 109 A86-13394

**TRACKING FILTERS**
Using roll-angle measurements to track aircraft maneuvers p 92 A86-12677

**TRAFFIC CONTROL**
Simulation of the enhanced traffic alert and collision avoidance system (TCAS 2) [NASA-CR-176328] p 93 N86-12216

**TRAILING EDGES**
An improved viscid/inviscid interaction procedure for transonic flow over airfoils [NASA-CR-3805] p 87 N86-12208

**TRAINING DEVICES**
The mission oriented terminal area simulation facility [NASA-TM-87621] p 128 N86-13944

**TRAJECTORY CONTROL**
Automation and integration on AFTI/F-16 [AIAA PAPER 85-3089] p 103 A86-14433

**TRANSMISSIONS (MACHINE ELEMENTS)**
Transmission acoustic vibration testing [AD-A159022] p 101 N86-13326

**TRANSOCEANIC FLIGHT**
Reserve generator for over-ocean twins p 106 A86-14244

**TRANSONIC FLOW**
The design, performance and analysis of a high work capacity transonic turbine [ASME PAPER 85-GT-15] p 105 A86-13058
Symmetric transonic flow past wings of large aspect ratios p 78 A86-13352
A joint analysis of the boundary layer and inviscid flow around the axisymmetric rear section of a fuselage p 79 A86-13373
Construction of equivalent profiles and approximate calculation of transonic flow past the root section of a swept wing p 80 A86-13396
Determination of the shape of a profile from a specified chord diagram of Mach numbers in transonic flow p 80 A86-13397
The use of reverse flow to calculate transonic flow past bodies p 81 A86-13412
A new fast solver procedure applied to the BGK computer program for transonic flow past an aerofoil p 83 A86-14360
Computation of rotor blade flows using the Euler equations [AIAA PAPER 85-5010] p 84 A86-14455
Solution of transonic flow past rotor blades using the conservative full potential equation [AIAA PAPER 85-5012] p 84 A86-14456
GRUMFOIL: A computer code for the viscous transonic flow over airfoils [NASA-CR-3806] p 86 N86-12202
Some recent advances in computational aerodynamics for helicopter applications [NASA-TM-86777] p 87 N86-12207
An improved viscid/inviscid interaction procedure for transonic flow over airfoils [NASA-CR-3805] p 87 N86-12208
Introduction to cryogenic wind tunnels [NASA-CR-177966] p 113 N86-12238
A direct-inverse method for transonic and separated flows about airfoils [NASA-CR-176403] p 89 N86-13300

**TRANSONIC SPEED**
A tomographic technique for aerodynamics at transonic speeds [NASA-TM-86766] p 89 N86-13297

**TRANSONIC WIND TUNNELS**
Using suction for increasing Mach numbers in a perforated test section with a subsonic nozzle — of wind tunnel p 112 A86-13405
The status of two-dimensional testing at high transonic speeds in the University of Southampton transonic self-streamlining wind tunnel [NASA-CR-3919] p 86 N86-12203
Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections [NASA-CR-177992] p 86 N86-12204

**TRANSPARENCE**
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition [AD-A157943] p 89 N86-13302

**TRANSPORT AIRCRAFT**
The influence of advanced propulsion on short- to medium-range transport design p 95 A86-13264
Douglas plans continuing upgrades to maintain MD-80 competitiveness p 98 A86-15999
An analysis of the application of AI to the development of intelligent aids for flight crew tasks [NASA-CR-3944] p 90 N86-12212
Abrasion behavior of aluminum and composite skin coupons, stiffened skins and stiffened panels representative of transport airplane structures [NASA-TP-2520] p 100 N86-13316
Aircraft of the future [NASA-TM-77952] p 100 N86-13318
Alerted monitors: Human operators aided by automated detectors [PB85-222750] p 126 N86-13906

**TRANSPORTATION NETWORKS**
Air traffic prediction and optimal control of air transportation system — Russian book p 90 A86-13452

**TURBINE BLADES**
Protecting gas turbine components - The relative durability of a conventional and a platinum-modified aluminide coating p 114 A86-13005
Local heat-transfer measurements on a large scale-model turbine blade airfoil using a composite of a heater element and liquid crystals [ASME PAPER 85-GT-59] p 117 A86-13061
Secondary flows and losses downstream of a turbine cascade [ASME PAPER 85-GT-64] p 77 A86-13062
Performance evaluation of linear turbine cascades using three-dimensional viscous flow calculations [ASME PAPER 85-G-65] p 77 A86-13063
Effects of tip endwall contouring on the three-dimensional flow field in an annular turbine nozzle guide vane. I - Experimental investigation [ASME PAPER 85-GT-71] p 77 A86-13065
Simulation of the effects of shock wave passing on a turbine rotor blade [ASME PAPER 85-GT-112] p 77 A86-13067
The performance of composite structures p 121 A86-14680
Precision casting at Rolls-Royce p 121 A86-14973
Test of jet engine turbine blades by thermography p 106 A86-15410

**TURBINE ENGINES**
Cumulative-damage modeling of fatigue crack growth in turbine engine materials p 105 A86-13599
Composition and photochemical reactivity of turbine engine exhaust [AD-A157643] p 107 N86-12230

**TURBINES**
The design, performance and analysis of a high work capacity transonic turbine [ASME PAPER 85-GT-15] p 105 A86-13058
Improved temperature detection system for use on film cooled turbine airfoils [AD-D011762] p 107 N86-12228

**TURBOCOMPRESSORS**
Multistage compressor stator/rotor interaction p 85 A86-14556
Fluid machines: Expanding the limits, past and future [NASA-TM-87161] p 107 N86-12227

**TURBOFAN ENGINES**
The design, performance and analysis of a high work capacity transonic turbine [ASME PAPER 85-GT-15] p 105 A86-13058
DEAN - A program for Dynamic Engine ANalysis [AIAA PAPER 85-1354] p 106 A86-14430
Length adjustable strut link with low aerodynamic drag [AD-D011851] p 107 N86-12232
Effects of velocity profile and inclination on dual-jet-induced pressures on a flat plate in a crosswind [NASA-CR-177361] p 87 N86-13287

**TURBOJET ENGINES**
Experimental study of ceramic-coated tip seals for turbojet engines p 121 A86-15227

Analysis of particulates in the exhaust plume of a J52-P3 turbojet engine at military power
[AD-A157840] p 107 N86-12231

**TURBOMACHINE BLADES**
The effect of the deflector type on internal heat transfer in blades with transverse coolant flow
p 120 A86-13673
Vibration analysis of rotating turbomachinery blades by an improved finite difference method
p 106 A86-14336

**TURBOPROP AIRCRAFT**
Review of recent research on interior noise of propeller aircraft p 97 A86-14527

**TURBOPROP ENGINES**
Development of modern turboprop engines
p 106 A86-14358

**TURBULENCE**
An investigation into the vertical axis control power requirements for landing VTOL type aircraft onboard nonaviation ships in various sea states
[NASA-CR-176355] p 88 N86-13294
Fluid forces on two circular cylinders in crossflow
[DE85-014294] p 124 N86-13704

**TURBULENT BOUNDARY LAYER**
The effect of the bluntness and the half-angle of a cone on the turbulent transition of a boundary layer at free-stream Mach 6 p 80 A86-13391
Boundary-layer development on the afterbody of an engine nacelle p 82 A86-13532
Measurements in the turbulent boundary layer on an 'infinite' swept wing p 86 A86-16102
An evaluation of four methods of numerical analysis for two-dimensional airfoil flows. Revision
[AD-A157248] p 87 N86-12209
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[AD-A157750] p 89 N86-13301
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302

**TURBULENT FLOW**
Statistical formulation of the objectives of the aerodynamic experiment p 80 A86-13381
Evaluation of low Reynolds number turbulence models for attached and separated flows p 121 A86-14539
Numerical and experimental studies of 3-D and unsteady turbulent body/appendage/propeller flows
[AD-A157078] p 123 N86-12552

**TURBULENT JETS**
Multispark flow visualization of lateral jet injection into a swirling cross flow p 85 A86-14561

**TURNING FLIGHT**
Calculation of equilibrium turn p 109 A86-13436
Post stall maneuvers and thrust vectoring performance analysis
[AD-A158100] p 110 N86-12235
Pilot-oriented performance measurement
[AD-A158849] p 126 N86-13890

**TWO DIMENSIONAL BOUNDARY LAYER**
Measurements in the turbulent boundary layer on an 'infinite' swept wing p 86 A86-16102

**TWO DIMENSIONAL FLOW**
Calculation of flows in two- and three-dimensional nozzles by an approximate factorization method
p 77 A86-13294
Certain properties of two-dimensional flows in the case of flow past bodies with jets p 82 A86-13431
Evaluation of a method for analyzing the aperture region of two-dimensional external compression inlets
[AIAA PAPER 85-3072] p 83 A86-14432
An evaluation of four methods of numerical analysis for two-dimensional airfoil flows. Revision
[AD-A157248] p 87 N86-12209

**TWO PHASE FLOW**
An experimental study of a vacuum water-air ejector with a multichannel liquid-supply nozzle ensuring jet-pair collision p 119 A86-13382
Optical technique to study the impact of heavy rain on aircraft performance
[NASA-CR-177080] p 123 N86-12580

## U

**U.S.S.R. SPACE PROGRAM**
Studies in the history and theory of the development of science and technology in the fields of aviation, rocketry, and space. Number 3 — Russian book
p 131 A86-13462

**ULTRASONIC FLAW DETECTION**
Boeing Military Airplane Company's robotic ultrasonic inspection system p 118 A86-13180

**UNIFORM FLOW**
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

**UNITED STATES**
Emerging aerospace technologies
[NASA-TM-88837] p 131 N86-14213

**UNIVERSITIES**
The status of two-dimensional testing at high transonic speeds in the University of Southampton transonic self-streamlining wind tunnel
[NASA-CR-3919] p 86 N86-12203
The 1983 NASA/ASEE Summer Faculty Fellowship Research Program research reports
[NASA-CR-171904] p 130 N86-14078

**UNSTEADY FLOW**
A study of the normal of a delta-wing aircraft at large angles of attack during unsteady motion
p 79 A86-13379
Influence of unsteady flow effects on the length of operation of a hypersonic shock tunnel
p 112 A86-13428
Calculation of unsteady flow in a two-stage gas turbine engine p 105 A86-13444
Unsteady potential flow for oscillating airfoils
p 83 A86-14359
Viscous flow results for the vortex-airfoil interaction problem
[AIAA PAPER 85-4053] p 83 A86-14451
Unsteady aerodynamics of airfoils oscillating in and out of dynamic stall
[AIAA PAPER 85-4076] p 84 A86-14453
Solution of transonic flow past rotor blades using the conservative full potential equation
[AIAA PAPER 85-5012] p 84 A86-14456
Separated flow unsteady aerodynamic theory
p 85 A86-14529
Calculation of unsteady fan rotor response caused by downstream flow distortions p 85 A86-14558
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

**UPGRADING**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314

**UPPER SURFACE BLOWN FLAPS**
Strain measurement of the USB-flap structures of NAL STOL aircraft p 95 A86-13315

**UPWASH**
Some design philosophy for reducing the community noise of advanced counter-rotation propellers
[NASA-TM-87099] p 129 N86-14007

**USER MANUALS (COMPUTER PROGRAMS)**
GRUMFOIL: A computer code for the viscous transonic flow over airfoils
[NASA-CR-3806] p 86 N86-12202
PLTTER user's guide
[NASA-CR-177385] p 88 N86-13291

**UTILITY AIRCRAFT**
Flutter clearance tests on a Transavia PL-12/T-400 Skyfarmer
[AD-A157212] p 110 N86-12234

## V

**V/STOL AIRCRAFT**
Powered-lift technology on the threshold
p 96 A86-14245
Simulation world moves up to V/STOL
p 112 A86-14246
Ground effects on V/STOL and STOL aircraft: A survey
[NASA-TM-86825] p 89 N86-13299

**VACUUM APPARATUS**
An experimental study of a vacuum water-air ejector with a multichannel liquid-supply nozzle ensuring jet-pair collision p 119 A86-13382

**VAN DER WAAL FORCES**
Crushing strength of aluminum oxide agglomerates
[AD-A158051] p 124 N86-13756

**VANES**
Wind tunnel turning vanes of modern design
[NASA-TM-87146] p 113 N86-12239

**VARIABLE GEOMETRY STRUCTURES**
A solution of inverse problem for multi-element aerofoils through application of panel method p 83 A86-13546

**VARIABLE PITCH PROPELLERS**
Hub effects in propeller design and analysis
[AD-A158853] p 108 N86-13331

**VARIANCE (STATISTICS)**
A model for the life variance of a structural element under irregular loading p 119 A86-13388

**VELOCITY DISTRIBUTION**
BLR studies on conic model with LDA in FL-1 wind tunnel p 87 N86-12434

**VELOCITY MEASUREMENT**
Velocity measurements in the near field of a rotor blade in hover
[AIAA PAPER 85-5013] p 84 A86-14457

**VERTICAL AIR CURRENTS**
The numerical computation of aircraft response to arbitrary vertical gust distributions p 110 A86-14534

**VERTICAL MOTION SIMULATORS**
Simulation world moves up to V/STOL
p 112 A86-14246

**VERTICAL TAKEOFF AIRCRAFT**
Stability and control of VTOL capable airships in hovering flight p 109 A86-14236
Ground-simulation investigation of VTOL airworthiness criteria for terminal area operations p 90 A86-14237
Army VTOL research and development - The first century p 75 A86-16096
An investigation into the vertical axis control power requirements for landing VTOL type aircraft onboard nonaviation ships in various sea states
[NASA-CR-176355] p 88 N86-13294

**VIBRATION DAMPING**
Prediction and measurement of damping of vibrations of structures by adhesives p 118 A86-13171
Estimation of the fluctuation amplitude of the angle of attack of a flight vehicle with nonlinear damping characteristics in the presence of atmospheric turbulence p 114 A86-13386
Dynamic response of a laminated plate with friction damping
[ASME PAPER 85-DET-16] p 122 A86-16032

**VIBRATION ISOLATORS**
Transient test of suspension electronics for gyroscope
[AD-D011853] p 123 N86-12585

**VIBRATION MODE**
A property of the elastic vibrations of nearly symmetric systems p 119 A86-13387

**VIBRATION TESTS**
Ground vibration test of the laminar flow control JStar airplane
[NASA-TM-86398] p 100 N86-13321

**VIBRATIONAL STRESS**
Modeling realistic environmental stresses on external stores p 95 A86-13275

**VISCOELASTIC DAMPING**
Prediction and measurement of damping of vibrations of structures by adhesives p 118 A86-13171

**VISCOUS FLOW**
Performance evaluation of linear turbine cascades using three-dimensional viscous flow calculations
[ASME PAPER 85-G-65] p 77 A86-13063
Asymptotic solution of the fluid-flow problem in the core of a vortex sheet p 81 A86-13413
Viscous flow results for the vortex-airfoil interaction problem
[AIAA PAPER 85-4053] p 83 A86-14451
The efficient simulation of separated three-dimensional viscous flows using the boundary-layer equations
[AIAA PAPER 85-4064] p 84 A86-14452
GRUMFOIL: A computer code for the viscous transonic flow over airfoils
[NASA-CR-3806] p 86 N86-12202
Effect of surface waviness on a supercritical laminar-flow-control airfoil
[NASA-TM-85705] p 86 N86-12206
An improved viscid/inviscid interaction procedure for transonic flow over airfoils
[NASA-CR-3805] p 87 N86-12208
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

**VISUAL ACUITY**
Criteria for a state-of-the-art vision test system
[AD-A157099] p 126 N86-12973

**VISUAL PERCEPTION**
Criteria for a state-of-the-art vision test system
[AD-A157099] p 126 N86-12973
An analytical comparison of three visual approach slope indicators: VASIS, T-VASIS and PAPI
[ARL/SYS-R-33] p 93 N86-13309
Pilot-oriented performance measurement
[AD-A158849] p 126 N86-13890

**VOLTMETERS**
China report: Science and technology
[JPRS-CST-85-029] p 122 N86-12446

**VON KARMAN EQUATION**
Some solutions to the Karman equation describing flow past the salient points of a profile p 79 A86-13363

**VORTEX GENERATORS**
Double-branched vortex generator
[NASA-TM-86201] p 89 N86-13298

**VORTEX SHEETS**
Asymptotic solution of the fluid-flow problem in the core of a vortex sheet p 81 A86-13413
Certain problems of fluid flow near the core of a spiral discontinuity p 120 A86-13424
**VORTICES**
The effect of a perforated wall on incompressible flow past a U-shaped vortex p 81 A86-13406
Effect of cantilevers on the lift characteristics of a thin swept wing and vortex-wake stability p 81 A86-13422
Formation of asymmetric separated flow past slender bodies of revolution at large angles of attack p 82 A86-13429
Viscous flow results for the vortex-airfoil interaction problem
[AIAA PAPER 85-4053] p 83 A86-14451
Calculation of steady flow about propellers using a surface panel method p 85 A86-14559
Microbursts - A hazard for aircraft --- small, intense thunderstorm outflow p 124 A86-14816
Pressure fluctuations on rotor blades generated by blade-vortex interaction p 86 A86-16122
Some recent advances in computational aerodynamics for helicopter applications
[NASA-TM-86777] p 87 N86-12207
Double-branched vortex generator
[NASA-TM-88201] p 89 N86-13296
Some design philosophy for reducing the community noise of advanced counter-rotation propellers
[NASA-TM-87099] p 129 N86-14007

W

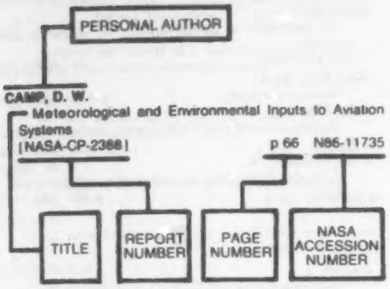
**WAKES**
Calculation of steady flow about propellers using a surface panel method p 85 A86-14559
Some design philosophy for reducing the community noise of advanced counter-rotation propellers
[NASA-TM-87099] p 129 N86-14007
**WALL FLOW**
The effect of a perforated wall on incompressible flow past a U-shaped vortex p 81 A86-13406
Wall-interference assessment in three-dimensional slotted-wall wind tunnels
[NASA-CR-176320] p 113 N86-12240
**WALL PRESSURE**
Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections
[NASA-CR-177992] p 86 N86-12204
**WALL TEMPERATURE**
High-temperature thermocouple and heat flux gauge using a unique thin film-hardware hot junction
[ASME PAPER 85-GT-18] p 117 A86-13059
**WAVE PACKETS**
A numerical analysis of the characteristics of a Tollmien-Schlichting wave packet in a boundary layer on a flat plate p 79 A86-13374
**WAVE PROPAGATION**
Waves due to a steadily moving source on a floating ice plate --- used as aircraft runway p 124 A86-13535
**WEAPON SYSTEMS**
Portable computerized tester improves flight-line maintenance p 121 A86-15528
**WEAPONS DELIVERY**
Automation and integration on AFTI/F-16
[AIAA PAPER 85-3089] p 103 A86-14433
**WEDGE FLOW**
Hypersonic flow past non-slender wedges, cones and ogives in oscillation p 76 A86-13047
**WEDGES**
A study of heat transfer on wedges with a swept leading edge and a sharply bent generatrix p 81 A86-13399
**WEIGHT REDUCTION**
Design of a minimum-weight gliding wing p 96 A86-13437
Weight optimization of stiffened cylinders under axial compression p 120 A86-14348
**WIND SHEAR**
Microbursts - A hazard for aircraft --- small, intense thunderstorm outflow p 124 A86-14816
Wind shear induced by solitary waves in the lower atmosphere
[IAF PAPER 85-410] p 125 A86-15866
**WIND TUNNEL APPARATUS**
Subsonic thermal wind tunnel with an Eiffel chamber p 112 A86-13443
Improved drag element for wind tunnel sting balances p 112 A86-14532
**WIND TUNNEL MODELS**
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302
**WIND TUNNEL TESTS**
Influence of unsteady flow effects on the length of operation of a hypersonic shock tunnel p 112 A86-13428
Icing wind tunnel tests on the CSIRO liquid water probe p 102 A86-14220
Air Force Academy Aeronautics Digest
[AD-A157215] p 76 N86-12200
The status of two-dimensional testing at high transonic speeds in the University of Southampton transonic self-streamlining wind tunnel
[NASA-CR-3919] p 86 N86-12203
Performance of an alpha-vane and pitot tube in simulated heavy rain environment
[NASA-CR-176353] p 103 N86-12220
User's guide to STIPPAN: A panel method program for slotted tunnel interference prediction
[NASA-CR-176003] p 113 N86-12237
BLR studies on conic model with LDA in FL-1 wind tunnel p 87 N86-12434
Double-branched vortex generator
[NASA-TM-88201] p 89 N86-13296
Study of the influence of an oscillating spoiler on the surrounding aerodynamic field
[IMFL-3119] p 90 N86-13303
Algorithms for the reduction of wind-tunnel data derived from strain gauge force balances
[ARL/AERO-R-164] p 113 N86-13337
Preliminary measurement of the noise from the 2/9 scale model of the Large-scale Advanced Propfan (LAP) propeller, SR-7A
[NASA-TM-87116] p 129 N86-14006
**WIND TUNNEL WALLS**
The status of two-dimensional testing at high transonic speeds in the University of Southampton transonic self-streamlining wind tunnel
[NASA-CR-3919] p 86 N86-12203
Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections
[NASA-CR-177992] p 86 N86-12204
Study of the influence of an oscillating spoiler on the surrounding aerodynamic field
[IMFL-3119] p 90 N86-13303
**WIND TUNNELS**
Wind tunnel turning vanes of modern design
[NASA-TM-87146] p 113 N86-12239
Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302
Heat transfer and pressure drop performance of a finned-tube heat exchanger proposed for use in the NASA Lewis Altitude Wind Tunnel
[NASA-TM-87151] p 123 N86-13677
**WIND VANES**
Performance of an alpha-vane and pitot tube in simulated heavy rain environment
[NASA-CR-176353] p 103 N86-12220
**WING LOADING**
Doublet strip method for oscillating swept tapered wings in incompressible flow p 85 A86-14537
**WING OSCILLATIONS**
A combined method for the analysis of the aerodynamic forces acting on an oscillating flight vehicle in supersonic flow p 79 A86-13380
A property of the elastic vibrations of nearly symmetric systems p 119 A86-13387
Certain criteria and formulas for the analysis of flexural-torsional flutter p 109 A86-13394
Doublet strip method for oscillating swept tapered wings in incompressible flow p 85 A86-14537
**WING PANELS**
Panel design for optimum strength and stability with allowance for the nonuniformity of heating p 119 A86-13357
**WING PROFILES**
The linear theory of a profile in a compressible gas with additional jet flow p 78 A86-13351
Wing structure design for maximum aileron efficiency p 95 A86-13368
Certain characteristics of parachute-wing aerodynamics p 80 A86-13389
Construction of equivalent profiles and approximate calculation of transonic flow past the root section of a swept wing p 80 A86-13396
Determination of the shape of a profile from a specified chord diagram of Mach numbers in transonic flow p 80 A86-13397
Quasi-solutions of an inverse boundary value problem of hydroaerodynamics p 120 A86-13983
A study of the flow around a wing equipped with a spoiler p 83 A86-14186
Wing aspect ratio optimization related to payload and to fuel consumption of transport propeller airplanes
[SAWE PAPER 1615] p 98 A86-14975
**WING ROOTS**
Construction of equivalent profiles and approximate calculation of transonic flow past the root section of a swept wing p 80 A86-13396
**WING TIPS**
China report: Science and technology
[JPRS-CST-85-029] p 122 N86-12446
Wingtip sails tested on Y-5 aircraft p 99 N86-12450
**WINGS**
F/A 18 composite wing automated drilling system p 117 A86-13111
Aerodynamic characteristics of a finite-aspect-ratio wing in hypersonic flow of a radiating gas p 78 A86-13359
Design of a minimum weight gliding wing p 96 A86-13437
Optimization of structural load-bearing designs using anisotropic models according to aeroelasticity conditions p 96 A86-13438
Supersonic gas flow past a V-shaped wing p 82 A86-13440
Measurement of preferential moisture ingress in composite wing/spar joints p 116 A86-16100
Simulation of the enhanced traffic alert and collision avoidance system (TCAS 2)
[NASA-CR-176328] p 93 N86-12216
**WORKLOADS (PSYCHOPHYSIOLOGY)**
Pilot-oriented performance measurement
[AD-A158849] p 126 N86-13890
Effects of digital altimetry on pilot workload
[NASA-TM-86424] p 126 N86-13892

X

**X-29 AIRCRAFT**
X-29 flight testing p 95 A86-13213
**XV-15 AIRCRAFT**
Ground-simulation investigation of VTOL airworthiness criteria for terminal area operations p 90 A86-14237

# PERSONAL AUTHOR INDEX

## Typical Personal Author Index Listing



PERSONAL AUTHOR
CAMP, D. W.
Meteorological and Environmental Inputs to Aviation Systems
[NASA-CP-2388] p 66 N86-11735
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABOLHASSANI, J. S.**
Numerical solutions of Navier-Stokes equations for a Butler wing
[NASA-CR-174202] p 88 N86-13293

**ACKERMANN, J.**
Multi-model approaches to robust control system design p 127 A86-14830

**ACREE, C. W., JR.**
Preliminary report on in-flight measurement of rotor hub drag and lift using the RSRA
[NASA-TM-86764] p 100 N86-13319

**ADHYE, R. Y.**
Secondary flows and losses downstream of a turbine cascade
[ASME PAPER 85-GT-64] p 77 A86-13062

**AGAPOV, V. P.**
Allowance for initial conditions in static and dynamic calculations of structures by the finite element method
p 119 A86-13419

**ALDRIDGE, J. P.**
AIRID - An application of the KAS/Prospector expert system builder to airplane identification
p 128 A86-15283

**ALLEN, G. P.**
Ribbon-burner simulation of T-700 turbine shroud for ceramic-lined seals research p 106 A86-15225

**ALLEN, H. W.**
Modeling realistic environmental stresses on external stores p 95 A86-13275

**AN, J.**
The numerical computation of aircraft response to arbitrary vertical gust distributions p 110 A86-14534

**ANDEEN, G. B.**
Physical distribution system for aircraft external fuel tanks-survey
[AD-A158275] p 101 N86-13324

**ANDERSON, R. K.**
Tomorrow's fleet - The light helictoper family (LHX)
p 98 A86-16097

**ANDRACCHIO, C. A.**
High-temperature thermocouple and heat flux gauge using a unique thin film-hardware hot junction
[ASME PAPER 85-GT-18] p 117 A86-13059

**ANDREWS, D. M.**
Development of a flight software testing methodology
[NASA-CR-176391] p 128 N86-13922

**AOKI, K.**
Multispark flow visualization of lateral jet injection into a swirling cross flow p 85 A86-14561

**ARKADOV, IU. K.**
Compact gas ejector of a high degree of compression with spiral arrangement of the nozzles
p 82 A86-13433

**ARMIAGOV, A. A.**
Methods of constructing R-curves and application of these curves for evaluation of materials (Review)
p 117 A86-13011

**ARUTIUNOV, IU. A.**
The use of reverse flow to calculate transonic flow past bodies p 81 A86-13412

**AVERY, L. G., JR.**
Airborne telemetry - The advanced range instrumentation aircraft p 92 A86-13225

## B

**BACK, L. H.**
Sound generation by flow over relatively deep cylindrical cavities p 129 A86-16058

**BACK, W. E.**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314

**BAEDER, J. D.**
Some recent advances in computational aerodynamics for helicopter applications
[NASA-TM-86777] p 87 N86-12207

**BALL, R. E.**
The fundamentals of aircraft combat survivability analysis and design p 97 A86-14498

**BALLHAUS, W. F., JR.**
Emerging aerospace technologies
[NASA-TM-86837] p 131 N86-14213

**BANICHUK, N. V.**
Design of a minimum-weight gliding wing
p 96 A86-13437

**BARBOUR, S.**
An extended phase-lock technique for aided acquisition p 93 A86-13227

**BARFIELD, A. F.**
Automation and integration on AFTI/F-16
[AIAA PAPER 85-3089] p 103 A86-14433

**BARIANI, P.**
Fracture toughness characterization of light alloys for aeronautical use p 114 A86-12761

**BARLOW, A.**
PLTTER user's guide
[NASA-CR-177385] p 88 N86-13291

**BARON, S.**
An analysis of the application of AI to the development of intelligent aids for flight crew tasks
[NASA-CR-3944] p 90 N86-12212

**BAUCHSPIES, J. S.**
Tradeoff analysis of technology needs for public service helicopters
[NASA-CR-3927] p 100 N86-13317

**BAUMBICK, R. J.**
Fiber optics for propulsion control systems
[ASME PAPER 84-GT-97] p 105 A86-13054

**BAUMGARDNER, D.**
Icing wind tunnel tests on the CSIRO liquid water probe p 102 A86-14220

**BAYEV, V. K.**
Experimental study of the combustion of gas-air mixtures in a channel and the diffusion combustion in a slipstream at high velocities
[AD-A157495] p 116 N86-12271

**BEAUCLAIR, N.**
Forging in the aerospace industry p 121 A86-14424

**BECKER, A.**
Data analysis of airborne electromagnetic bathymetry
[AD-A157132] p 125 N86-12744

**BEDIN, A. P.**
Experimental study of gas flow around blunt objects
p 85 A86-15980

**BEERMAN, D. A.**
Impact of flying qualities on mission effectiveness for helicopter air combat p 110 A86-14531

**BELIANOVSKII, E. S.**
Calculation of flow around rotating circular cascades with allowance for circumferential flow nonuniformity induced by a perturbation at the inlet p 82 A86-13426

**BELL, H. H.**
Pilot-oriented performance measurement
[AD-A158849] p 126 N86-13890

**BEMENT, L. J.**
Advanced emergency openings for commercial aircraft
[NASA-TM-87580] p 91 N86-13305

**BENEK, J. A.**
On applications of chimera grid schemes to store separation
[NASA-TM-88193] p 88 N86-13292

**BERENYI, S. G.**
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 1
[NASA-CR-174923-VOL-1] p 108 N86-13328
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 2
[NASA-CR-174923-VOL-2] p 108 N86-13329
Lightweight two-stroke cycle aircraft diesel engine technology enablement program, volume 3
[NASA-CR-174923-VOL-3] p 108 N86-13330

**BERKUT, V. D.**
Measurement of the heterogeneous recombination probability of oxygen atoms in the course of supersonic dissociated gas flow interaction with solid body surfaces
p 85 A86-14743

**BERTKE, R. S.**
Response determination of propeller to bird strike using high speed photography p 90 A86-15308

**BESPALOV, A. M.**
Subsonic thermal wind tunnel with an Eiffel chamber
p 112 A86-13443

**BIESIADNY, T. J.**
Experimental study of ceramic-coated tip seals for turbojet engines p 121 A86-15227

**BILLIAS, M. G.**
Electrically conductive structural adhesive
p 115 A86-13170

Asymptotic solution of the fluid-flow problem in the core of a vortex sheet p 81 A86-13413

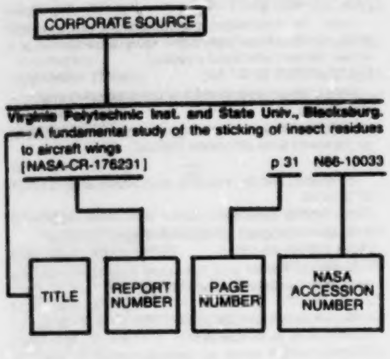
# CORPORATE SOURCE INDEX

### Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231] p 31 N86-10033
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Aeronautical Research Labs., Melbourne (Australia).**
A survey of aeronautical structural research in Australia
[AD-A157211] p 76 N86-12199
Flutter clearance tests on a Transavia PL-12/T-400 Skyfarmer
[AD-A157212] p 110 N86-12234
An analytical comparison of three visual approach slope indicators: VASIS, T-VASIS and PAPI
[ARL/SYS-R-33] p 93 N86-13309
Algorithms for the reduction of wind-tunnel data derived from strain gauge force balances
[ARL/AERO-R-164] p 113 N86-13337
**Air Command and Staff Coll., Maxwell AFB, Ala.**
The helicopter to fixed wing conversion program: A critical review
[AD-A156820] p 125 N86-12968
**Air Force Academy, Colo.**
Air Force Academy Aeronautics Digest
[AD-A157215] p 76 N86-12200
Pitch rate versus G command as the longitudinal flight control system design strategy for a statistically unstable fighter type aircraft with two control surfaces
[AD-A158803] p 111 N86-13334
**Air Force Engineering and Services Center, Tyndall AFB, Fla.**
A durable airfield marking system
[AD-A157953] p 113 N86-13339
**Air Force Flight Test Center, Edwards AFB, Calif.**
T-33 (Silver Star MK 3) pitot-static system calibration
[AD-A157864] p 104 N86-12221
**Air Force Human Resources Lab., Brooks AFB, Tex.**
Pilot-oriented performance measurement
[AD-A158849] p 126 N86-13890
**Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.**
An application of adaptive learning to malfunction recovery
[AD-A158129] p 110 N86-12236
Aircrew dose and engine dust ingestion from nuclear cloud penetration
[AD-A159246] p 101 N86-13327
**Air Force Systems Command, Wright-Patterson AFB, Ohio.**
Experimental study of the combustion of gas-air mixtures in a channel and the diffusion combustion in a slipstream at high velocities
[AD-A157495] p 116 N86-12271
Radio-absorbing materials
[AD-A157496] p 122 N86-12495
**Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio.**
Compressor research facility F100 high pressure compressor inlet total pressure and swirl profile simulation
[AD-A157108] p 107 N86-12229
Post stall maneuvers and thrust vectoring performance analysis
[AD-A156100] p 110 N86-12235
**Akron Univ., Ohio.**
NASA LeRC/Akron University Graduate Cooperative Fellowship Program and Graduate Student Researchers Program
[NASA-CR-174826] p 130 N86-13219
**Argonne National Lab., Ill.**
Fluid forces on two circular cylinders in crossflow
[DE85-014294] p 124 N86-13704
**Army Aviation Engineering Flight Activity, Edwards AFB, Calif.**
Limited Airworthiness and Flight Characteristics (A and FC) test of the quick fix configuration
[AD-A157716] p 101 N86-13323
**Army Construction Engineering Research Lab., Champaign, Ill.**
Design criteria upgrade for US Army Type 2 air traffic control towers
[AD-A159115] p 94 N86-13314
**Army Propulsion Lab., Cleveland, Ohio.**
DEAN - A program for Dynamic Engine ANalysis
[AIAA PAPER 85-1354] p 106 A86-14430
Experimental study of ceramic-coated tip seals for turbojet engines p 121 A86-15227
**Army War Coll., Carlisle Barracks, Pa.**
The C-17: We need it yesterday
[AD-A157147] p 99 N86-12219
**Arnold Engineering Development Center, Arnold Air Force Station, Tenn.**
Ribbon-burner simulation of T-700 turbine shroud for ceramic-lined seals research p 106 A86-15225
Method to detect ethylene glycol in gaseous mixtures
[AD-A158109] p 116 N86-12272
Crushing strength of aluminum oxide agglomerates
[AD-A158051] p 124 N86-13756

## B

**Battelle Columbus Labs., Ohio.**
Composition and photochemical reactivity of turbine engine exhaust
[AD-A157643] p 107 N86-12230
**Bolt, Beranek, and Newman, Inc., Cambridge, Mass.**
An analysis of the application of AI to the development of intelligent aids for flight crew tasks
[NASA-CR-3944] p 90 N86-12212
**Bradley Univ., Peoria, Ill.**
Computer graphics applications to crew displays
p 128 N86-14104

## C

**California Univ., Berkeley.**
Dynamic features of combustion p 114 A86-12925
**California Univ., Berkeley. Lawrence Berkeley Lab.**
Dynamic features of combustion p 114 A86-12925
**California Univ., Los Angeles.**
Aeromechanical stability analysis of a hybrid heavy lift multirotor vehicle in hover p 110 A86-14530
**College of William and Mary, Williamsburg, Va.**
User's guide to STIPPAN: A panel method program for slotted tunnel interference prediction
[NASA-CR-176003] p 113 N86-12237
Wall-interference assessment in three-dimensional slotted-wall wind tunnels
[NASA-CR-176320] p 113 N86-12240

## D

**Dayton Univ., Ohio.**
Performance of an alpha-vane and pitot tube in simulated heavy rain environment
[NASA-CR-176353] p 103 N86-12220
**Department of the Air Force, Washington, D.C.**
Pneumatic actuator device
[AD-D011794] p 99 N86-12217
Compartmented, filament wound, one-piece aircraft fuel tanks
[AD-D011793] p 107 N86-12225
Improved temperature detection system for use on film cooled turbine airfoils
[AD-D011762] p 107 N86-12228
Length adjustable strut link with low aerodynamic drag
[AD-D011651] p 107 N86-12232
Transient test of suspension electronics for gyroscope
[AD-D011853] p 123 N86-12585
**Department of the Navy, Washington, D. C.**
Passive arm retention curtain
[AD-D011876] p 91 N86-13307
**Draper (Charles Stark) Lab., Inc., Cambridge, Mass.**
The evaluation of failure detection and isolation algorithms for restructurable control
[NASA-CR-177963] p 93 N86-13310

## E

**Ecosystems International, Inc., Crofton, Md.**
NASA flight operations review
[NASA-CR-176393] p 91 N86-13306

## F

**Federal Aviation Administration, Moffett Field, Calif.**
Ground-simulation investigation of VTOL airworthiness criteria for terminal area operations p 90 A86-14237
**Federal Aviation Administration, Washington, D.C.**
Report of accomplishments under the airport improvement program
[AD-A156834] p 113 N86-12241
Statistical sampling of aircraft operations at non-towered airports
[AD-A157095] p 128 N86-13051
**Federal Aviation Agency, Atlantic City, N.J.**
Aircraft interior panel test criteria derived from full-scale fire tests
[FAA/CT-85/23] p 91 N86-12214
**Flight Systems, Inc., Newport Beach, Calif.**
Impact of flying qualities on mission effectiveness for helicopter air combat p 110 A86-14531
**Florida Univ., Gainesville.**
CBR (California Bearing Ratio) design of flexible airfield pavements with case study
[AD-A158101] p 113 N86-12242

## G

**General Accounting Office, Washington, D. C.**
FAA (Federal Aviation Administration) could improve overall aviation safety and reduce costs associated with airport instrument landing systems
[PB85-195444] p 91 N86-12215
Navy should join the Air Force and Army program to develop an advanced integrated avionics system
[PB85-222503] p 104 N86-12224
**General Electric Co., Cincinnati, Ohio.**
Subscale-model and full-scale engine mixed-flow exhaust system performance comparison
p 106 A86-14528

**Grumman Aerospace Corp., Bethpage, N.Y.**
GRUMFOIL: A computer code for the viscous transonic flow over airfoils
[NASA-CR-3606] p 86 N86-12202
An improved viscid/inviscid interaction procedure for transonic flow over airfoils
[NASA-CR-3805] p 87 N86-12208

H

**Howmet Turbine Components Corp., White Hall, Mich.**
Experimental study of ceramic-coated tip seals for turbojet engines p 121 A86-15227

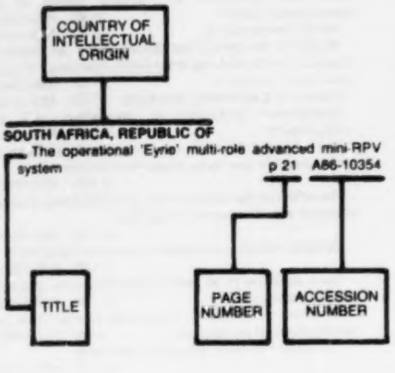
# FOREIGN TECHNOLOGY INDEX

## Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system
p 21
A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section.

## A

**AUSTRALIA**

Protecting gas turbine components - The relative durability of a conventional and a platinum-modified aluminide coating p 114 A86-13005

Icing wind tunnel tests on the CSIRO liquid water probe p 102 A86-14220

Longitudinal stability of a hovering, tethered rotorcraft p 109 A86-14235

A survey of aeronautical structural research in Australia [AD-A157211] p 76 N86-12199

Flutter clearance tests on a Transavia PL-12/T-400 Skyfarmer [AD-A157212] p 110 N86-12234

Development and evaluation of a microburst test apparatus for use as a minimum destructive test for parachute material [AD-A158110] p 123 N86-12620

An analytical comparison of three visual approach slope indicators: VASIS, T-VASIS and PAPI [ARL/SYS-R-33] p 93 N86-13309

Algorithms for the reduction of wind-tunnel data derived from strain gauge force balances [ARL/AERO-R-164] p 113 N86-13337

## C

**CANADA**

Canadian forces PCM telemetry processing and display system p 111 A86-13248

'But not with the greatest of ease' - A feasibility study of a human-powered ACV p 121 A86-14355

The in-flight simulation program at the NAE Flight Research Laboratory p 96 A86-14356

Development of modern turboprop engines p 106 A86-14358

Unsteady potential flow for oscillating airfoils p 83 A86-14359

A new fast solver procedure applied to the BGK computer program for transonic flow past an aerofoil p 83 A86-14360

Comment on 'Aerodynamic estimation techniques for aerostats and airships' p 85 A86-14541

**CHINA, PEOPLE'S REPUBLIC OF**

Missile guidance based on Kalman filter estimation of target maneuver p 102 A86-12683

Weight optimization of stiffened cylinders under axial compression p 120 A86-14348

The numerical computation of aircraft response to arbitrary vertical gust distributions p 110 A86-14534

A linear multivariable dynamical model of a supersonic inlet-engine combination p 85 A86-14560

Dynamic response of a laminated plate with friction damping [ASME PAPER 85-DET-16] p 122 A86-16032

Japanese report on China's F-8 fighter p 111 N86-12405

BLR studies on conic model with LDA in FL-1 wind tunnel p 87 N86-12434

China report: Science and technology [JPRS-CST-85-029] p 122 N86-12446

Wingtip sails tested on Y-5 aircraft p 99 N86-12450

## F

**FRANCE**

Atom-probe microanalysis of a nickel-base superalloy p 114 A86-12989

A study of the flow around a wing equipped with a spoiler p 83 A86-14186

The 'Super Etendard' is always of interest p 97 A86-14423

Forging in the aerospace industry p 121 A86-14424

Study of the influence of an oscillating spoiler on the surrounding aerodynamic field [IMFL-3119] p 90 N86-13303

Aircraft crashing. Analysis and identification methods. Presentation of a solution method [IMFL-4116] p 91 N86-13306

West Europe report: Science and technology [JPRS-WST-85-031] p 123 N86-13616

Certification granted to Franco-Italian ATR 42 p 92 N86-13617

ATR 42 production work in French, Italian plants detailed p 76 N86-13618

## G

**GERMANY,FEDERAL REPUBLIC OF**

Experimental evaluation of heavy fan-high-pressure compressor interaction in a three-shaft engine. I - Experimental setup and results [ASME PAPER 85-GT-173] p 104 A86-13053

The use of automated riveting systems in aircraft construction p 95 A86-13127

A programmable data acquisition system with integrated test and calibration facilities p 102 A86-13215

Telemetry from experimental rescue- and recovery systems p 95 A86-13219

Metals anad plastics - State of the art and perspectives [MBB-Z-49-85-OE] p 116 A86-14474

Uncertainty and control - Some activities at DFVLR p 127 A86-14827

Multi-model approaches to robust control system design p 127 A86-14830

Test of jet engine turbine blades by thermography p 106 A86-15410

Pressure fluctuations on rotor blades generated by blade-vortex interaction p 86 A86-16122

The effect of higher harmonic control (HHC) on a four-bladed hingeless model rotor p 99 A86-16124

**GREECE**

Using roll-angle measurements to track aircraft maneuvers p 92 A86-12677

## I

**INDIA**

Hypersonic flow past non-slender wedges, cones and ogives in oscillation p 76 A86-13047

Combustion related to solid-fuel ramjets p 116 A86-14566

Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight p 98 A86-16123

**INTERNATIONAL ORGANIZATION**

Effects of tip endwall contouring on the three-dimensional flow field in an annular turbine nozzle guide vane. I - Experimental investigation [ASME PAPER 85-GT-71] p 77 A86-13065

**ISRAEL**

Improved drag element for wind tunnel sting balances p 112 A86-14532

Flutter and divergence aeroelastic characteristics for composite forward swept cantilevered wing p 97 A86-14536

Portable computerized tester improves flight-line maintenance p 121 A86-15528

**ITALY**

Fracture toughness characterization of light alloys for aeronautical use p 114 A86-12761

Wing aspect ratio optimization related to payload and to fuel consumption of transport propeller airplanes [SAWE PAPER 1615] p 98 A86-14975

## J

**JAPAN**

Numerical analysis of fully three-dimensional periodic flows through a turbine stage [ASME PAPER 85-GT-57] p 76 A86-13060

Strain measurement of the USB-flap structures of NAL STOL aircraft p 95 A86-13315

A solution of inverse problem for multi-element aerofoils through application of panel method p 83 A86-13546

Changes of flying skills during non-flight periods p 125 A86-13944

Doublet strip method for oscillating swept tapered wings in incompressible flow p 85 A86-14537

Introduction to operational ASDAR system p 125 N86-12915

A method for calculating flow fields around moving bodies [NAL-TR-859T] p 88 N86-13288

## N

**NETHERLANDS**

The right combination unlocks aerospace EMC p 112 A86-13848

Liability of air traffic control agencies and airport operators in civil law jurisdictions p 130 A86-14372

Application of pulsed reflection holography to material testing p 122 A86-16090

**NEW ZEALAND**

Waves due to a steadily moving source on a floating ice plate p 124 A86-13535

## P

**POLAND**

Dynamics of non-autonomous spatial motion of an aeroplane with deformable control systems p 109 A86-13931

A method for numerical analysis of the aerodynamic characteristics of an aeroplane wing in the subcritical range of the flying velocity p 83 A86-13933

## R

**ROMANIA (RUMANIA)**

Computation of aeronautical structures p 120 A86-14157

## S

**SWITZERLAND**

Altimeters to meet military low level needs p 102 A86-13548

Manufacturers prepare for Europe's new fighters p 75 A86-13549

## T

**TAIWAN**

Wind shear induced by solitary waves in the lower atmosphere
[IAF PAPER 85-410] p 125 A86-15686

## U

**U.S.S.R.**

Methods of constructing R-curves and application of these curves for evaluation of materials (Review) p 117 A86-13011

Radiative gasdynamic processes in imploding discharges in a plasmodynamic magnetoplasma compressor p 129 A86-13031

Calculation of flows in two- and three-dimensional nozzles by an approximate factorization method p 77 A86-13294

A marching explicit-implicit procedure for calculating supersonic flow past bodies p 78 A86-13296

The linear theory of a profile in a compressible gas with additional jet flow p 78 A86-13351

Symmetric transonic flow past wings of large aspect ratios p 78 A86-13352

A study of flow near a shock wave intersection line p 78 A86-13353

The effect of the incalculable flow regime of air scoops on flow past a wing p 78 A86-13354

Estimation of the probability of a flight parameter exceeding a specified value under conditions of atmospheric turbulence p 108 A86-13355

Panel design for optimum strength and stability with allowance for the nonuniformity of heating p 119 A86-13357

Selecting the principal parameters of a wedge-profiled wing p 78 A86-13358

Aerodynamic characteristics of a finite-aspect-ratio wing in hypersonic flow of a radiating gas p 78 A86-13359

Flow of a diatomic rarefied gas around a cone p 78 A86-13360

An algorithm for calculating the coupling between matrices of elastic influence coefficients for two systems of computational points p 119 A86-13362

Some solutions to the Karman equation describing flow past the salient points of a profile p 79 A86-13363

Calculation of supersonic inviscid flow past a plane air intake element with an isolated head wave p 79 A86-13364

Estimation of the deviation limits of the aircraft path parameters during automatic landing p 108 A86-13365

Consideration of the multiplicity of critical spots in a structure in estimating the durability and the service life p 119 A86-13367

Wing structure design for maximum aileron efficiency p 95 A86-13368

Equations of rolling for a wheel with an elastic tire p 96 A86-13369

A study of flutter on the basis of frequency tests at subcritical regimes p 109 A86-13370

Characteristics of the lifting properties of aircraft with sweptforward wings at supersonic velocities p 96 A86-13371

A joint analysis of the boundary layer and inviscid flow around the axisymmetric rear section of a fuselage p 79 A86-13373

A numerical analysis of the characteristics of a Tollmien-Schlichting wave packet in a boundary layer on a flat plate p 79 A86-13374

Profiling of supersonic ducts with specified nonisentropic parameters at the exit p 79 A86-13375

A numerical study of axisymmetric flow past a disk p 79 A86-13377

A study of the normal of a delta-wing aircraft at large angles of attack during unsteady motion p 79 A86-13379

A combined method for the analysis of the aerodynamic forces acting on an oscillating flight vehicle in supersonic flow p 79 A86-13380

Statistical formulation of the objectives of the aerodynamic experiment p 80 A86-13381

An experimental study of a vacuum water-air ejector with a multichannel liquid-supply nozzle ensuring jet-pair collision p 119 A86-13382

Estimation of the fluctuation amplitude of the angle of attack of a flight vehicle with nonlinear damping characteristics in the presence of atmospheric turbulence p 114 A86-13386

A property of the elastic vibrations of nearly symmetric systems p 119 A86-13387

A model for the life variance of a structural element under irregular loading p 119 A86-13388

Certain characteristics of parachute-wing aerodynamics p 80 A86-13389

Propagation of small perturbations during the interaction of nonviscous jets p 80 A86-13390

The effect of the bluntness and the half-angle of a cone on the turbulent transition of a boundary layer at free-stream Mach 6 p 80 A86-13391

A method for measuring the direction and the Mach number of a three-dimensional supersonic nozzle p 80 A86-13392

Certain criteria and formulas for the analysis of flexural-torsional flutter p 109 A86-13394

An analysis of separated flow of an ideal fluid past a finite-aspect-ratio mechanized wing p 80 A86-13395

Construction of equivalent profiles and approximate calculation of transonic flow past the root section of a swept wing p 80 A86-13396

Determination of the shape of a profile from a specified chord diagram of Mach numbers in transonic flow p 80 A86-13397

Using the shock-expansion method for calculating the aerodynamic characteristics of flight vehicles p 81 A86-13398

A study of heat transfer on wedges with a swept leading edge and a sharply bent generatrix p 81 A86-13399

Diffuser parameter optimization for low Reynolds numbers using experimental data p 111 A86-13400

Using suction for increasing Mach numbers in a perforated test section with a subsonic nozzle p 112 A86-13405

The effect of a perforated wall on incompressible flow past a U-shaped vortex p 81 A86-13406

Critical values of the Mach number of a radial airfoil cascade p 105 A86-13408

A method for arranging nodes along the lines of a computational grid during the numerical solution of problems in mathematical physics p 127 A86-13409

Using isoperimetric inequalities for the two-sided estimation of the torsional stiffness of a prismatic bar p 119 A86-13410

Linear theory of an equivalent profile in the problem concerning the influence of porous flow boundaries p 81 A86-13411

The use of reverse flow to calculate transonic flow past bodies p 81 A86-13412

Asymptotic solution of the fluid-flow problem in the core of a vortex sheet p 81 A86-13413

Acoustic characteristics of models of ejector suppressors of jet noise p 129 A86-13416

Minimization of aircraft flight time for a given distance with return to the original point p 109 A86-13417

Application of the state-space method to analyze the stability of digital systems p 127 A86-13418

Allowance for initial conditions in static and dynamic calculations of structures by the finite element method p 119 A86-13419

Analytical method for considering the elasticity of the blades in the aerodynamic calculation of a helicopter propeller p 96 A86-13421

Effect of cantilevers on the lift characteristics of a thin swept wing and vortex-wake stability p 81 A86-13422

Calculation of supersonic flow past a three-dimensional configuration using integral relationships p 81 A86-13423

Certain problems of fluid flow near the core of a spiral discontinuity p 120 A86-13424

Calculation of flow around rotating circular cascades with allowance for circumferential flow nonuniformity induced by a perturbation at the inlet p 82 A86-13426

Theory of self-similar regimes of supersonic flow in an axisymmetric channel with a sudden expansion p 82 A86-13427

Influence of unsteady flow effects on the length of operation of a hypersonic shock tunnel p 112 A86-13428

Formation of asymmetric separated flow past slender bodies of revolution at large angles of attack p 82 A86-13429

Separated flow past a sharp edge according to a reverse-jet scheme p 120 A86-13430

Certain properties of two-dimensional flows in the case of flow past bodies with jets p 82 A86-13431

Compact gas ejector of a high degree of compression with spiral arrangement of the nozzles p 82 A86-13433

Method for calculating the equilibrium spin of an aircraft p 109 A86-13435

Calculation of equilibrium turn p 109 A86-13436

Design of a minimum-weight gliding wing p 96 A86-13437

Optimization of structural load-bearing designs using anisotropic models according to aeroelasticity conditions p 96 A86-13438

Supersonic gas flow past a V-shaped wing p 82 A86-13440

Subsonic thermal wind tunnel with an Eiffel chamber p 112 A86-13443

Calculation of unsteady flow in a two-stage gas turbine engine p 105 A86-13444

Technological support for aircraft production p 75 A86-13446

Design of the flow path of aircraft gas-turbine engines p 105 A86-13447

Air traffic prediction and optimal control of air transportation system p 90 A86-13452

Aerohydromechanics p 82 A86-13456

Studies in the history and theory of the development of science and technology in the fields of aviation, rocketry, and space. Number 3 p 131 A86-13462

Cutouts in load-bearing structures p 120 A86-13463

Environment protection in connection with air transportation p 124 A86-13467

The drag of a thermally insulated plate in a stream of a compressible gas under mixed flow conditions p 120 A86-13671

The effect of the deflector type on internal heat transfer in blades with transverse coolant flow p 120 A86-13673

Dynamic strength problems in aerospace equipment p 120 A86-13690

Quasi-solutions of an inverse boundary value problem of hydroaerodynamics p 120 A86-13983

A numerical method for calculating internal subsonic swirling flows of an ideal gas p 85 A86-14679

The performance of composite structures p 121 A86-14680

Measurement of the heterogeneous recombination probability of oxygen atoms in the course of supersonic dissociated gas flow interaction with solid body surfaces p 85 A86-14743

Experimental study of gas flow around blunt objects p 85 A86-15980

Experimental study of the combustion of gas-air mixtures in a channel and the diffusion combustion in a slipstream at high velocities
[AD-A157495] p 116 N86-12271

Radio-absorbing materials
[AD-A157496] p 122 N86-12495

Gravimetric surveying with MI-6 helicopters p 125 N86-12680

Aircraft of the future
[NASA-TM-77952] p 100 N86-13318

USSR report: Space
[JPRS-USP-85-005] p 131 N86-14111

**UNITED KINGDOM**

Hardware integrity p 126 A86-13049

Aerodynamics - The role of the computer p 76 A86-13050

The design, performance and analysis of a high work capacity transonic turbine
[ASME PAPER 85-GT-15] p 105 A86-13058

Simulation of the effects of shock wave passing on a turbine rotor blade
[ASME PAPER 85-GT-112] p 77 A86-13067

Military avionics p 102 A86-13269

Boundary-layer development on the afterbody of an engine nacelle p 82 A86-13532

Requirements for gyroscopes for inertial navigation p 93 A86-13576

7J7 - Boeing sets the pace p 97 A86-14361

Microbursts - A hazard for aircraft p 124 A86-14816

The laminar airliner - Prospects and problems p 98 A86-14822

Precision casting at Rolls-Royce p 121 A86-14973

Measurements in the turbulent boundary layer on an 'infinite' swept wing p 86 A86-16102

Experience with a new approach to rotor aeroelasticity p 99 A86-16125

The status of two-dimensional testing at high transonic speeds in the University of Southampton transonic self-streamlining wind tunnel
[NASA-CR-3919] p 86 N86-12203

Derivation of jack movement influence coefficients as a basis for selecting wall contours giving reduced levels of interference in flexible walled test sections
[NASA-CR-177982] p 86 N86-12204

Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[AD-A157750] p 89 N86-13301

Recent experience in the RAE (Royal Aircraft Establishment) 5-metre wind tunnel of a china clay method for indicating boundary layer transition
[AD-A157943] p 89 N86-13302

Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 2: Final definition of Helix and Felix
[AD-A156622] p 101 N86-13322

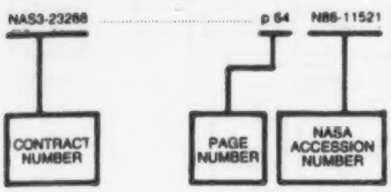
# CONTRACT NUMBER INDEX

### Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

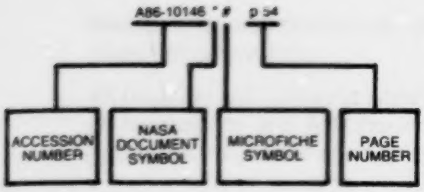
# ACCESSION NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 198)* **MARCH 1986**

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche[1] of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts.* Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on page vii.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

## FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

**A FUNDAMENTAL STUDY OF THE STICKING OF INSECT RESIDUES TO AIRCRAFT WINGS Annual Technical Report**

N. S. EISS, JR., J. P. WIGHTMAN, D. R. GILLIAM, and E. J. SIOCHI Apr. 1985 191 p refs

(Contract NAG1-300)

(NASA-CR-176231; NAS 1.26:176231) Avail: NTIS HC A09/MF A01 CSCL 01C

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

**AERODYNAMIC DESIGN CONSIDERATIONS FOR EFFICIENT HIGH-LIFT SUPERSONIC WINGS**

D. S. MILLER and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs

(AIAA PAPER 85-4076)

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 428 reports, journal articles, and other documents originally announced in March 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA).*

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 133

**Category 02 Aerodynamics** 135
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 157
Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 159
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 161
Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 170
Includes cockpit and cabin display devices; and flight instruments.

**Category 07 Aircraft Propulsion and Power** 173
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 175
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 179
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 182
Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 182
Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 185

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 191

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** 191

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 192

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 193

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 194

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** N.A.

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

**Category 19 General** 195

## AERONAUTICS (GENERAL)

**A86-16207**

**PARTS INTEGRATION - ADVANTAGES AND PROBLEMS**

K. B. ARMSTRONG (British Airways, Hounslow, England) IN: Carbon fibres: Uses and prospects; Proceedings of the Third International Conference, London, England, October 8-10, 1985 . London, Plastics and Rubber Institute, 1985, p. 15/1-15/6.

In the present consideration of comparative advantages and dissadvantages governed by the degree to which composite structure elements are integrated, with a view to size and cost, advantages are noted to accrue primarily to manufacturers, rather than to users. Larger structural elements are more difficult to remove when in need of repair; such large, expensive elements are, moreover, less likely to be held in stock for replacement. Cold-setting repair adhesives must be developed in order to obviate removal. O.C.

**A86-16855**

**AN AIRCRAFT MAINTENANCE AND REPAIR STRATEGY USING A TEST AND DIAGNOSTIC SYSTEM [STRATEGIE OBSLUHY A UDRZBY LETOUNU S VYUZITIM KONTROLNE-DIAGNOSTICKEHO SYSTEMU]**

B. SVOBODA Zpravodaj VZLU (ISSN 0044-5355), no. 2, 1985, p. 77-81. In Czech. refs

An approach to the definition of an aircraft maintenance and repair strategy using an automatic test and diagnostic system is developed which involves determining the operation cycle of an aircraft, working out a maintenance schedule, and describing briefly the types of jobs to be done during maintenance. The required labor for the maintenance of a third-generation aircraft, now being designed, is estimated in man-hours. Second- and third-generation aircraft are then compared in terms of maintenance requirements. V.L.

**A86-16859**

**A STUDY OF THE OPERATING CONDITION OF AIRCRAFT FROM THE RECORDINGS OF THE ONBOARD RECORDING EQUIPMENT [SLEDOVANI TECHNICKEHO STAVU LETOUNU ZE ZAZNAMU PALUBNIHO REGISTRACNIHO ZARIZENI]**

P. ROZTOCIL Zpravodaj VZLU (ISSN 0044-5355), no. 2, 1985, p. 97-99. In Czech.

Timely information on the operating condition of practice jet aircraft, available as soon as possible after the flight, is essential for improving the efficiency of aircraft maintenance and reducing the probability of emergency situations. The approach described here includes quick and in-depth localized analyses using a computer, the in-depth analysis being performed only in case of malfunctions. This is combined with a long-term statistic analysis of flight information. V.L.

**A86-16860**

**PROCESSING OF AIRBORNE TAPE RECORDINGS WITH THE AID OF USER PROGRAMS FOR MONITORING THE TECHNICAL CONDITION OF AIRCRAFT [ZPRACOVANI MAGNETICKEHO PALUBNIHO ZAZNAMU UZIVATELSKYMI PROGRAMY PRO KONTROLU TECHNICKEHO STAVU LETADLA]**

J. VORACKOVA Zpravodaj VZLU (ISSN 0044-5355), no. 2, 1985, p. 101-103. In Czech.

**A86-16861**

**USING DIAGNOSTIC SYSTEMS TO COLLECT DATA ON THE RELIABILITY OF AIRCRAFT [VYUZITI DIAGNOSTICKYCH SYSTEMU PRO SBER DAT O SPOLEHLIVOSTI LETECKE TECHNIKY]**

M. JELINEK Zpravodaj VZLU (ISSN 0044-5355), no. 2, 1985, p. 105-107. In Czech. refs

Diagnostic systems relying on the onboard recording of diagnostic parameters can also be used for collecting data on malfunctions occurring during flight operations. By expanding the disk memory of the ground-based flight-data processing system and by using special software, it is possible to provide the user with comprehensive reliability data for particular types of aircraft. The need for developing a standardized coding system is emphasized. V.L.

**A86-17379**

**COMPOSITE TAIL SECTION OFFERS SUPERIOR PERFORMANCE**

J. TUTKA (U.S. Army, Aviation Systems Command, St. Louis, MO) ManTech Journal, vol. 10, no. 3, 1985, p. 33-40. Army-supported research.

The development of a helicopter tail section using a wet filament winding cocure process is discussed. The optimization of the design in order to produce a light weight, low cost tail section with increased reliability is examined. The tailboom, vertical tail, and stabilator which compose the tail section are described. The wet filament cocuring manufacturing process, which begins with a single circuit helical pattern, then a two circuit pattern, multiple circuit patterns, and finally hoop or circumferential windings, is diagrammatically explained. The weight analysis, reliability assessment, nondestructive evaluation of components, ballastic vulnerability testing, and the evaluation of the FM antenna are conducted. A weight reduction of 71 pounds and a cost savings of $41,000.00 is achieved with this manufacturing process. I.F.

**A86-17380**

**PULTRUSION USED TO FABRICATE TAIL ROTOR SPAR**

H. REDICK (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) ManTech Journal, vol. 10, no. 3, 1985, p. 41-48. Army-supported research.

The development of a pultrusion manufacturing process for cost-effective fabrication of flexbeam spars is examined. Two design concepts are proposed; concept one is a build-up from fully cured plies with high design risk because not all the fibers are continuous, and concept two uses partially cured unidirectional graphite/epoxy pultrusion with a low design risk. The subscale and full-size testing of both design concepts is described; the concept two design was selected for fabrication. A cost comparison of the two design concepts with conventional spar manufacturing techniques reveals a significant savings is possible with the new manufacturing process; however, actual flight evaluation of the spar resulted in increased load requirements and reduced the cost-effectiveness of the pultrusion process. I.F.

**A86-17434**

### STEALTH

B. SWEETMAN Interavia (ISSN 0020-5168), vol. 40, Nov. 1985, p. 1217-1219.

In the present speculative discussion of 'stealth' or reduced observability technology currently being developed in high security facilities by U.S. military aircraft manufacturers, attention is given to historical trends in the measures used to reduce thermal IR emissions and radar reflectivity in such aircraft as the U-2 and SR-71. The importance of radar-absorbing materials and blended wing-fuselage surface contours is noted. 'Flying wing' configurations are suggested to be the most likely basis for the Advanced Technology Bomber that is to supplement the B-1B bomber force. Stealth-related features of proposed configurations for the U.S. Air Force's Advanced Tactical Fighter program are discussed. O.C.

**A86-18413**

### MAINTAINABLE DEMONSTRATION FOR ARMY HELICOPTERS

R. L. POWELL and W. S. MCDONALD (U.S. Army Aviation Systems Command, St. Louis, MO) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 4 p.

Maintainability is an aircraft system parameter that has become critical in the wake of the increasing complexity and cost that accrue to technological advancement; it must accordingly be given a prominent place in design considerations. Helicopter features prominently involved in maintainability are test points, accessibility of components, control systems, test equipment, tools, data displays, maintenance manuals, checklists, safety considerations, and system quality checks. The development of maintainability demonstration procedures should begin no later than the beginning of full scale development for a given system. O.C.

### OBSERVATIONS ON HELICOPTER INTEGRATED SYSTEM TESTING BASED ON F/A-18 EXPERIENCES

W. E. MCCLURE (McDonnell Aircraft Co., St. Louis, MO) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 14 p.

The U.S. Navy's F/A-18 Hornet Strike-Fighter development program preceded the U.S. Army's new advanced light-helicopter program - the LHX - by ten years. A review of both programs shows that they have many similarities. Both involve a significant move forward in systems technology and degrees of integration and automation. Both have similar development schedules. The avionics system for the LHX will closely resemble the F/A-18 except for the advances in technology. The F/A-18 developmental test process, the facilities used, and their applicability to advanced systems developments are discussed. Similar approaches and facilities will be required for the successful development of an advanced, highly integrated avionics system like the LHX. Author

### THE US ARMY AVIATION FLIGHT ACTIVITY - AN OVERVIEW

A. R. TODD (U.S. Army Aviation Engineering Flight Activity, Edwards AFB, CA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 3 p.

The U.S. Army's Aviation Engineering Flight Activity organization is responsible for flight tests leading to the airworthiness qualification of Army aircraft. Attention is presently given to the 24-year history of this organizatioh, and to the roles it fulfills in testing fabrication, maintenence, instrumentation, and data acquisition/reduction tasks. Emphasis is placed on real time data acquisition systems applicable to questions of performance, flying qualities, climatic conditions, and icing. O.C.

### HELICOPTER FATIGUE SPECIALISTS' MEETING, ST. LOUIS, MO, OCTOBER 16-18, 1984, PROCEEDINGS

Meeting sponsored by AHS. Alexandria, VA, American Helicopter Society, 1984, 395 p. For individual items see A86-18431 to A86-18449.

The present conference on helicopter structural fatigue considers generic aspects of delamination in composite materials fatigue, fatigue in thin walled composite tubes, the evaluation of the UH-60A's titanium main rotor hub, full scale fatigue testing of composites, and spectrum load analysis methods for aircraft structures. The AH-64, AV-8B, and SH-2F airframe fatigue test programs are featured, together with damage-tolerant design concepts applicable to dynamic helicopter components. Also discussed are the use of the Service Life Assessment Program for identification of life extension procedures applicable to fatigue-sensitive aircraft components, and damage tolerance in civil helicopter design. O.C.

### USE OF A SERVICE LIFE ASSESSMENT PROGRAM (SLAP) FOR IDENTIFYING SERVICE LIFE EXTENSION PROGRAM (SLEP) PROCEDURES FOR FATIGUE SENSITIVE AIRFRAME COMPONENTS

A. MONGILLO, A. MANK, and F. A. CAMARATTA (United Technologies Corp., Airframe Structures Dept., Stratford, CT) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 13-1 to 13-16.

The procedures for conducting a Service Life Assessment Program (SLAP) for fatigue sensitive airframe and landing gear components are presented in this paper. SLAP provides an analytical method for identifying Service Life Extension Program (SLEP) recommendations. SLEP, an effective means of extending the reliable service life of existing military fleet helicopters, is fast becoming an essential alternative to helicopter retirement. To achieve this goal it is imperative that the current service life capability of selected components be established by relying on crack initiation time and crack growth predictions based on current and projected helicopter usage. In this way critical fatigue sensitive components can be identified and replaced or improved to enhance aircraft system safety. Author
